September 26, 2023

CPU, GPU, FPGA, and ASICs

Tradeoffs

- ▶ The DRD 7.5 remit includes 'keeping pace with COTs technologies'
- ▶ DAQ evolution in recent years has become increasingly COTs based where possible
 - ▶ Economy of scale, standardisation and upgrade/maintenance benefits

- ▶ However, choosing to go COTs comes with caveats:
 - ▶ We're (usually) not the target market
 - ▶ It takes time and effort to develop for general purpose technologies
 - ▶ Technology evolution is fast and hard to predict
 - ▶ Choosing the right technology for a given task needs extensive R&D.
- ▶ This is compounded further by dilution of expertise
 - ▶ Every experiment has a few experts in a few TDAQ workflows
 - ▶ Every experiment has a few experts in a few different COTs technologies
 - ▶ These people may not always be the same.

- ▶ This project aims to:
 - ▶ **Benchmark** common TDAQ algorithms/workflows on existing and new architectures as they become available
 - ▶ **Develop** optimised 'reference' implementations of these algorithms/workflows
 - ▶ **Maintain** a community-led repository of these implementations and their benchmarks
- ▶ Think **Stack Overflow** for TDAQ development
- ▶ In doing so, we will serve as an up-to-date repository of information and expertise for TDAQ implementations that the community can use in decision making and design of future experiments

- ▶ Year 1:
 - ▶ Define project structure (Institute PIs + Chair)
 - ▶ Regular meetings to determine Figures of Merit (power, efficiency, cost), initial reference implementations for benchmarking, and representative hardware platforms.
 - ▶ Initial studies to commence
- ▶ Year 2
 - ▶ Develop and host a searchable repository for firmware, software and documentation of best-practice implementations
 - ▶ expand as performance gains are realised from reference implementations and encourage community input
- ▶ Year 3+
 - ▶ Revisit reference implementations and benchmarks as new tech comes to market
- ▶ Regular meetings rotated through contributing institutes to present progress and comparative benchmarks

7.5a's first study: Zero-suppression for the Mu2e DAQ

- ▶ Mu2e is an intensity frontier experiment at Fermilab
- ▶ High-rate Stopping target Monitor reads out a signal amplitude every 3ns with a throughput of 5.3 Gbits/sec. This data needs zero suppressed before further processing.
- ▶ University of Manchester MPhys students working in the Particle Physics DAQ testbed will develop HLS+VHDL (FPGA), CUDA (GPU) and multithreaded C++ (x86) implementations.
- ▶ Aim is to determine which implementations are highest throughput and lowest cost.

- ▶ Several interested groups signed the Lol:
 - ▶ Univ. of Bristol: IPU expertise.
 - ▶ Spain (ICTEA /U. Oviedo IP; IFIC-CSIC/U. Valencia.; CIEMAT (Madrid))
 - ▶ Universite de Geneve
 - ▶ University of Manchester
 - ▶ Josef-Stefan Institute (JSI) Ljubljana
- ▶ Resources and funding under discussion in most cases:
 - ▶ Resources are COTs and readily available in current technology generations in many cases. Do not expect significant expenditure on equipment in 7.5a.
- ▶ Survey commitments still being incorporated- will reach out shortly. Latecomers are welcome.

- ▶ Currently Niko and Conor are guiding the process
- ▶ Expect committed institutes to nominate a Project Chair at the first meetings
- ▶ Would expect a fixed-term to allow rotation among participating institutes
- ▶ Resources + Personpower to be discussed once chair appointed.
- ▶ Committed and interested institutes should make sure they are on the ECFA-DRD7-WG7_5-Contributors@cern.ch or ECFA-DRD7-WG7_5-Observers@cern.ch mailing lists
- ▶ We will arrange a dedicated list for this project shortly.
