Motivation

E

Effective Field Theory (EFT)

good tool to describe exp. data!

Motivation

E

UV completion?

more ambitious goal!

Effective Field Theory (EFT)

good tool to describe exp. data!

Motivation

E ↑

UV completion?

more ambitious goal!

Effective Field Theory (EFT)

good tool to describe exp. data!

☞ theory of **gravitons** (GR) → strings, …

☞ theory of **Goldstones** (Chiral Lagrangian) → Higgs mechanism, QCD, …

☞ **BSMs** { Dark Matter, Axions, Composite Higgs } → UV completion?

Motivation

E

UV completion?

more ambitious goal!

Effective Field Theory (EFT)

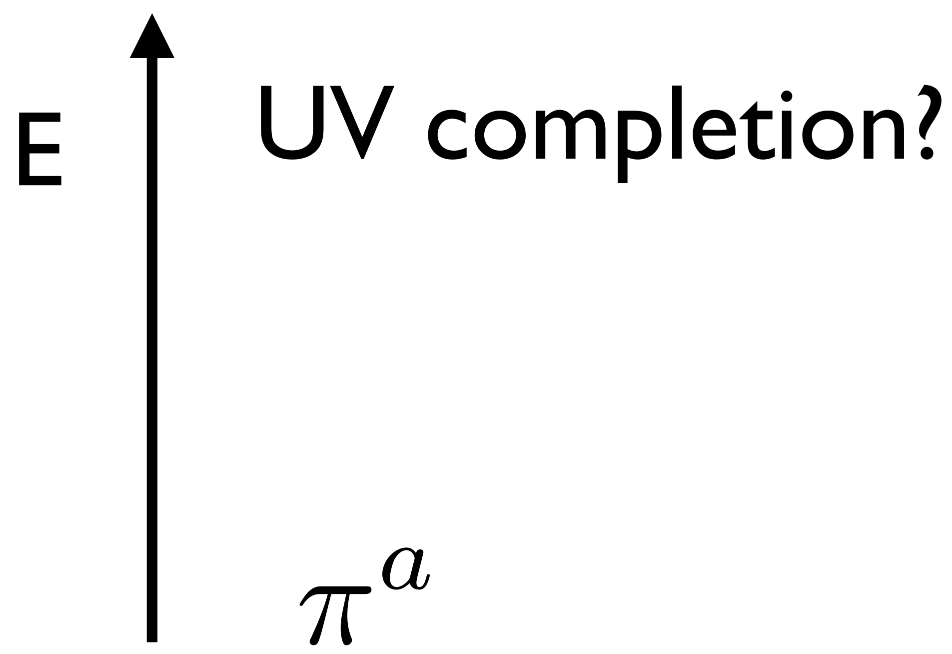
good tool to describe exp. data!

tackle by demanding **Positivity bounds**

(⊕ Lorentz, analyticity, locality, crossing)

☞ It has been shown in many recent examples that they can provide very **powerful** constraints

UV completion for a theory of pions



UV completion for a theory of pions

E

UV completion?

π^a

simplifying assumption:

☞ weakly-coupled theories (tree-level)

but with **infinite higher-spin states**

UV completion for a theory of pions

E

UV completion?

π^a

simplifying assumption:

☞ weakly-coupled theories (tree-level)

but with **infinite higher-spin states**

Also aiming **strongly-coupled gauge theories** (QCD)

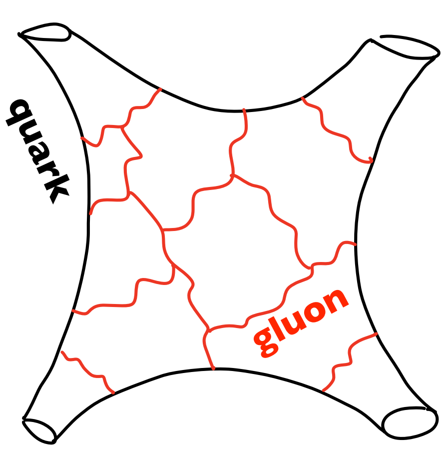
in the **large-N_c** limit:

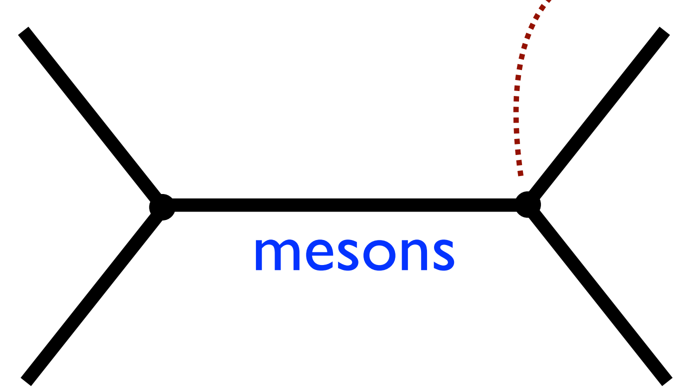
quarks, gluons

SU(N_c)

$N_c \to \infty$

mesons ($q\bar{q}$ states), glueballs





g ~1/√N_c

+ other channels

Positivity bounds

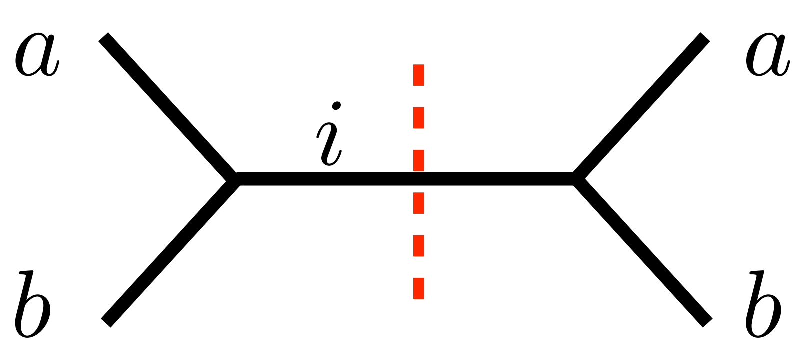
- **Generalizations of the optical theorem:**

forward limit (tree-level):



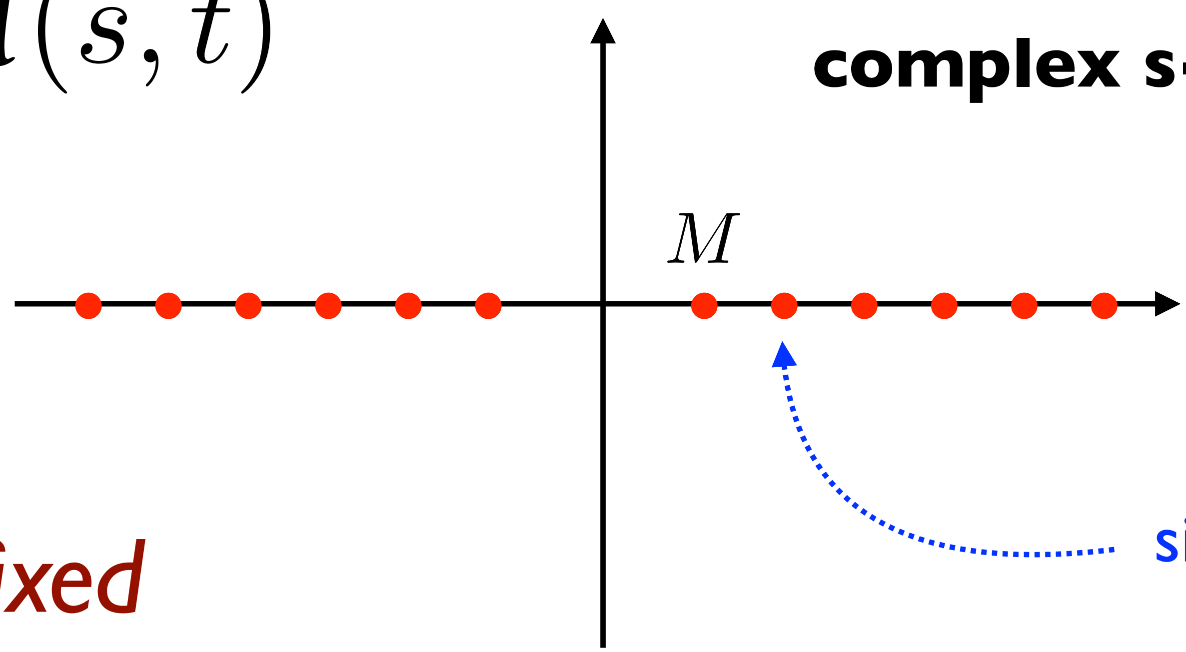
$$\propto \quad |g_{abi}|^2 \quad \geq 0$$

Positivity bounds on (tree-level mediated) amplitudes

Analytical structure of amplitudes:

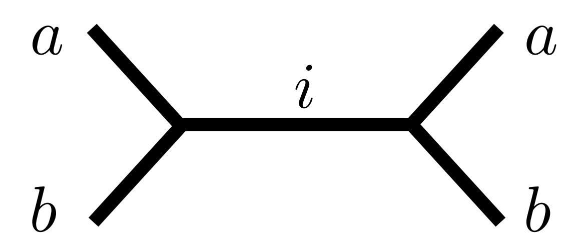
$\mathcal{M}(s,t)$

complex s-plane



u fixed

simple poles due to states in the s-channel:

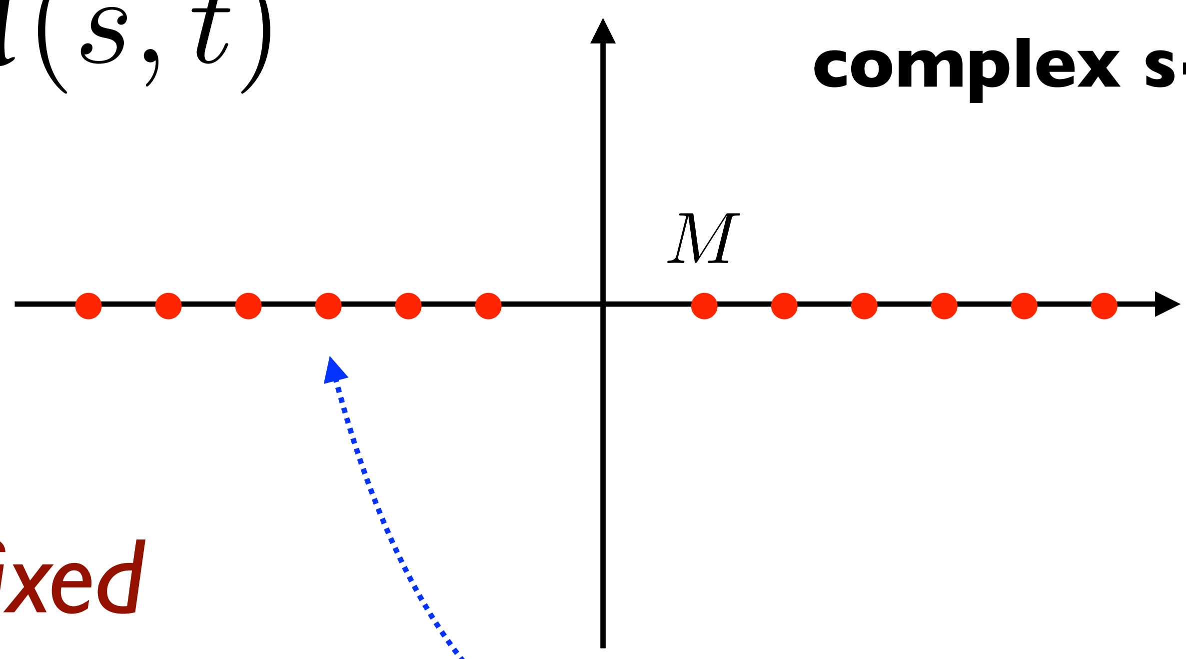


Positivity bounds on (tree-level mediated) amplitudes

Analytical structure of amplitudes:

$\mathcal{M}(s,t)$

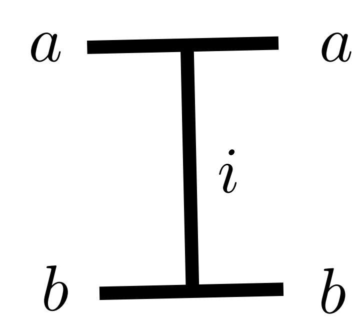
complex s-plane



u fixed

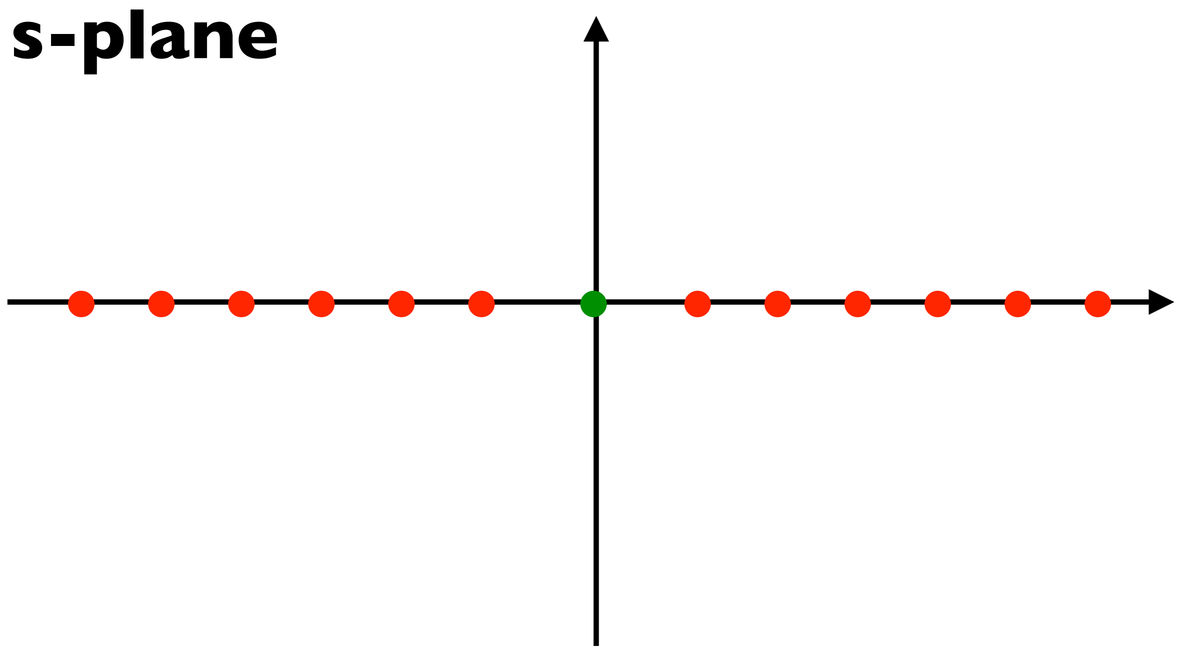
$s = -t-u+4m^2$

simple poles due to states in the t-channel:



Positivity bounds on (tree-level mediated) amplitudes

This simple structure allows to get dispersion relations:



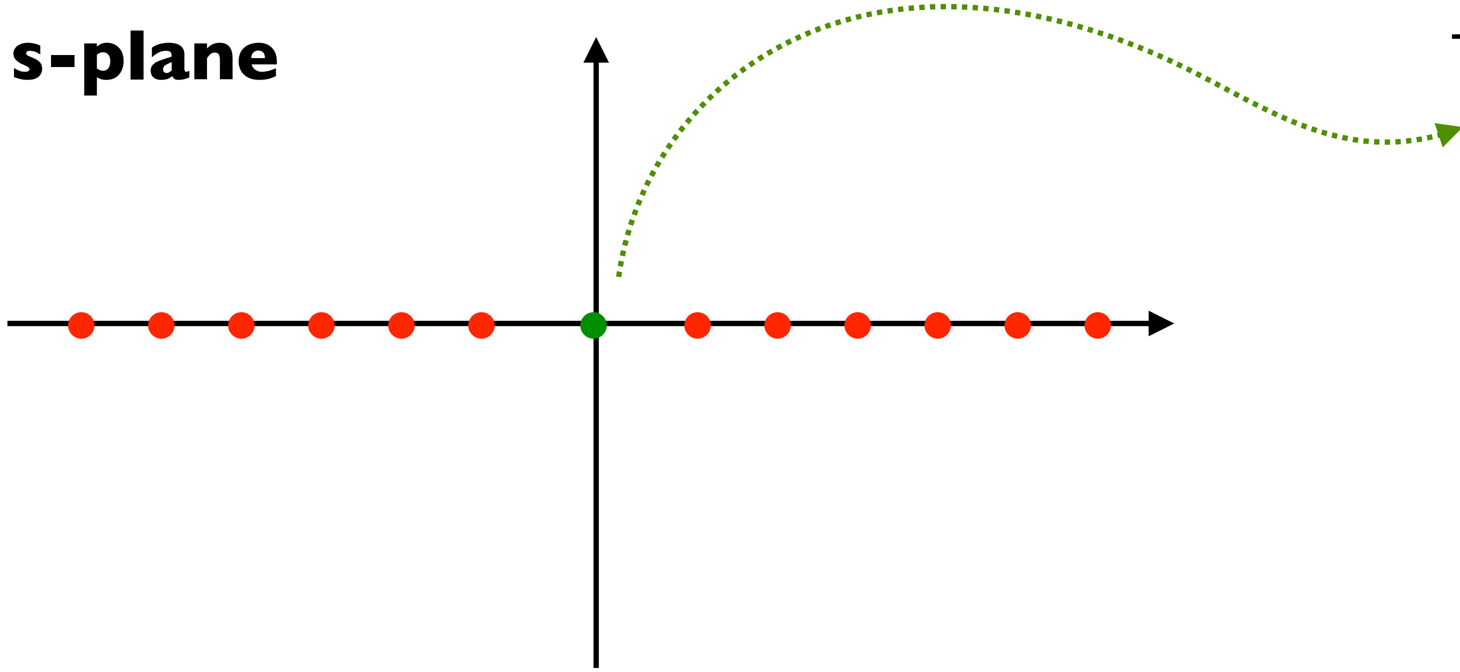
$$\frac{\mathcal{M}(s,t)}{s^{k+1}}$$

$k = 1, 2, 3, \ldots$

u fixed

Positivity bounds on (tree-level mediated) amplitudes

This simple structure allows to get dispersion relations:



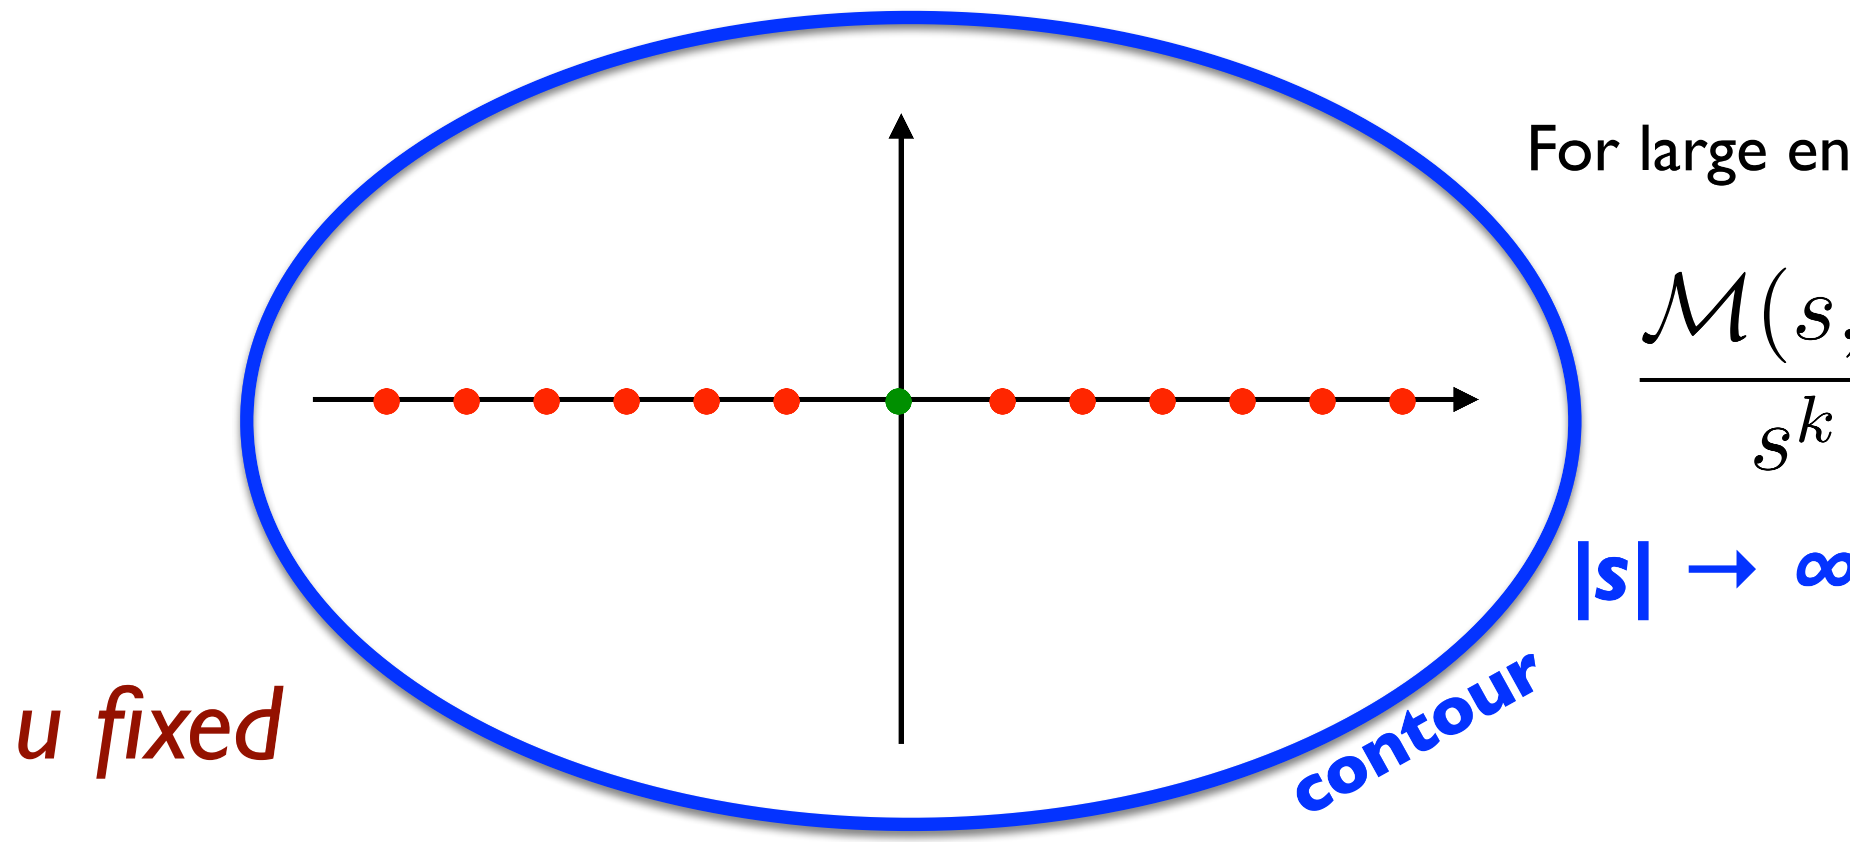
$$\frac{\mathcal{M}(s,t)}{s^{k+1}}$$

$k = 1, 2, 3, \ldots$

u fixed

Positivity bounds
on (tree-level mediated) amplitudes

This simple structure allows to get dispersion relations:



For large enough k, we have:

$$\frac{\mathcal{M}(s,t)}{s^k} \underset{|s|\to\infty}{\longrightarrow} 0$$

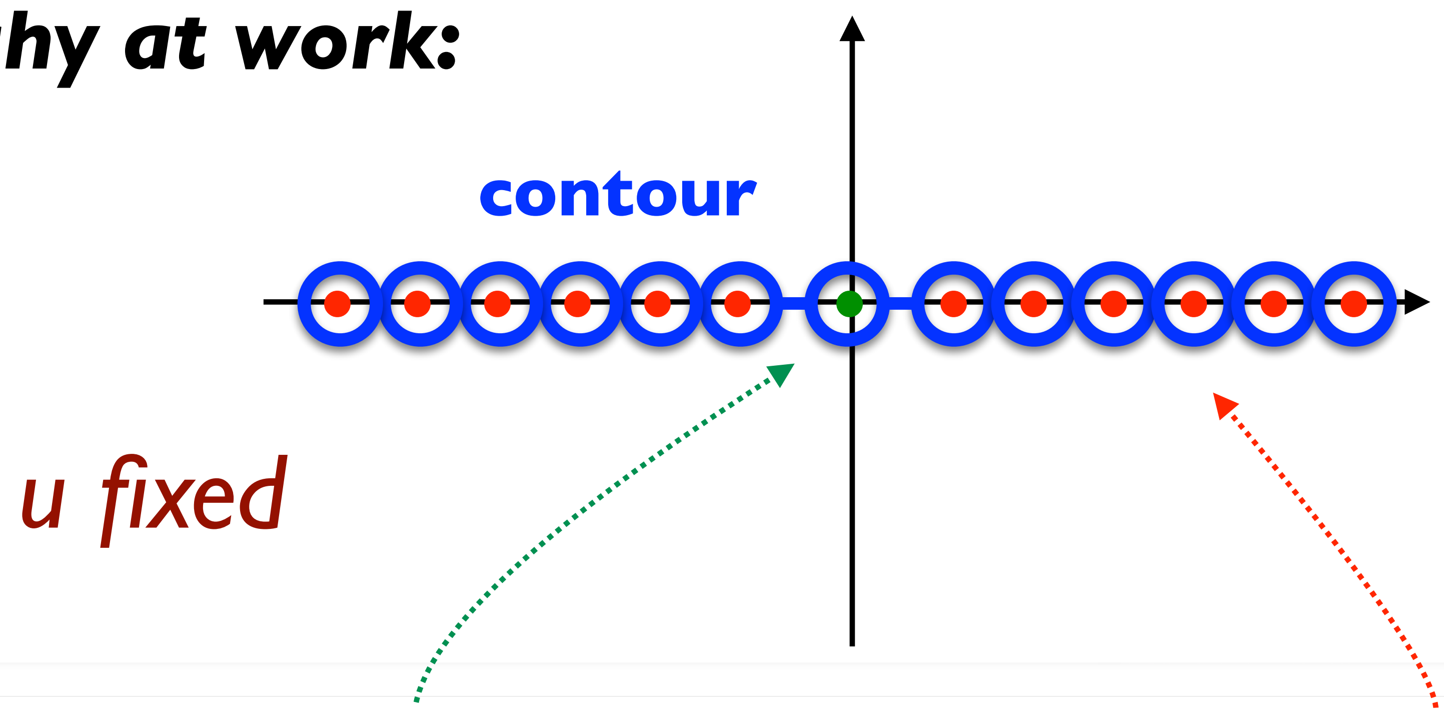
☞

$$\oint \frac{\mathcal{M}(s,t)}{s^{k+1}} = 0$$

Positivity bounds on (tree-level mediated) amplitudes

This simple structure allows to get dispersion relations:

Cauchy at work:



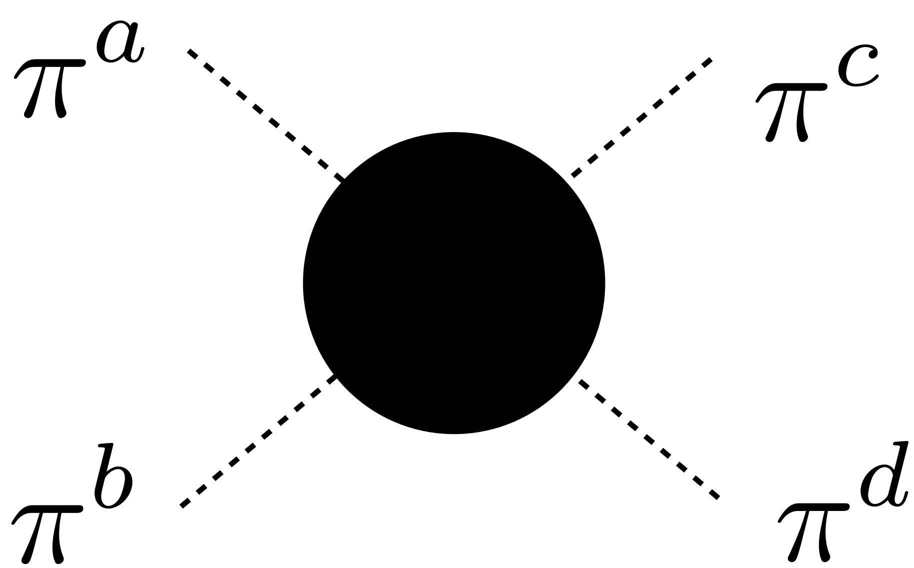
residue at the origin + sum of residues at the mass poles = 0

(low-energy EFT parameters ***related to*** *masses and couplings of mesons)*

pion-pion scattering

J. Albert and L. Rastelli, arXiv: 2203.11950

Lets assume an **SU(2)** (isospin) global symmetry

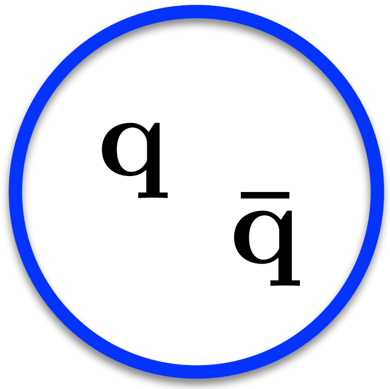


$\pi^a \in \mathbf{3}$ *massless*

Goldstones from
SU(2)⊗SU(2)→SU(2)

Extra condition from large-N_c:

Mesons =

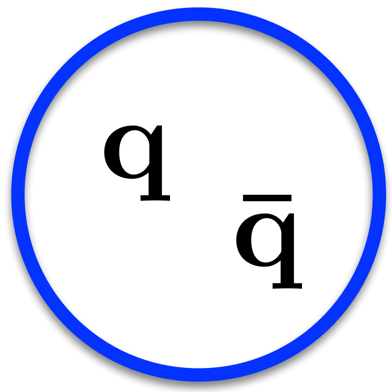


Isospin = $I = 1/2 \otimes 1/2 = 0, 1$

☞ **no I =2 states**

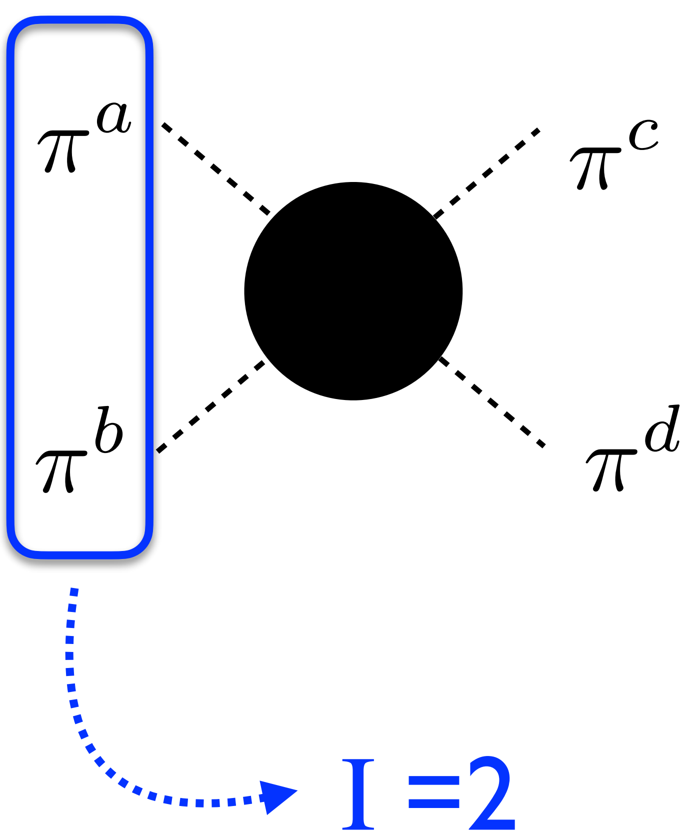
Extra condition from large-N_c:

Mesons =



Isospin = I = 1/2⊗1/2 = 0, 1

☞ **no I =2 states**

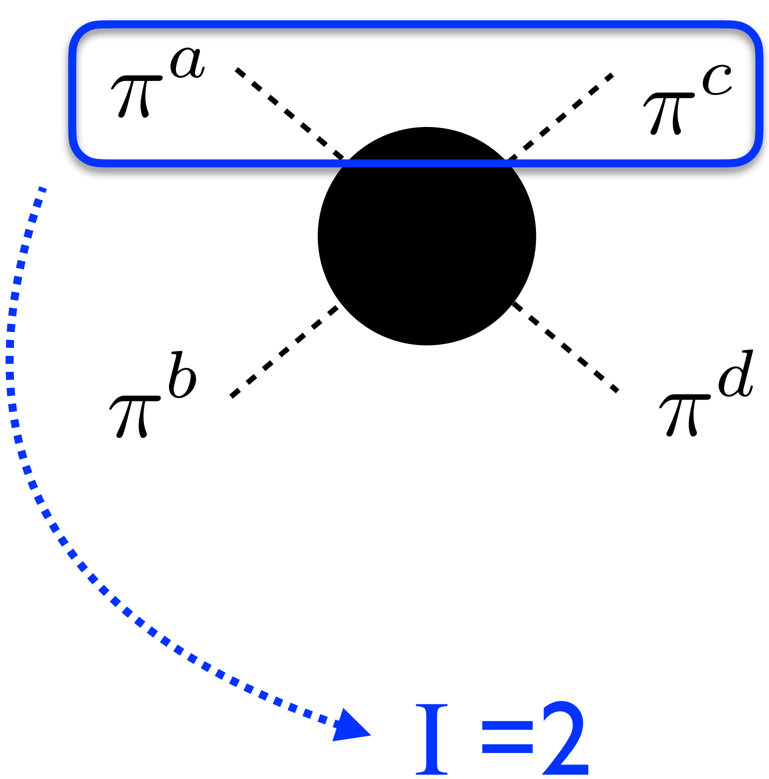


$\mathcal{M}_s^{I=2}$ cannot have poles in s

Extra condition from large-N_c:

Mesons = 
Isospin = I = 1/2⊗1/2 = 0, 1

☞ **no I =2 states**



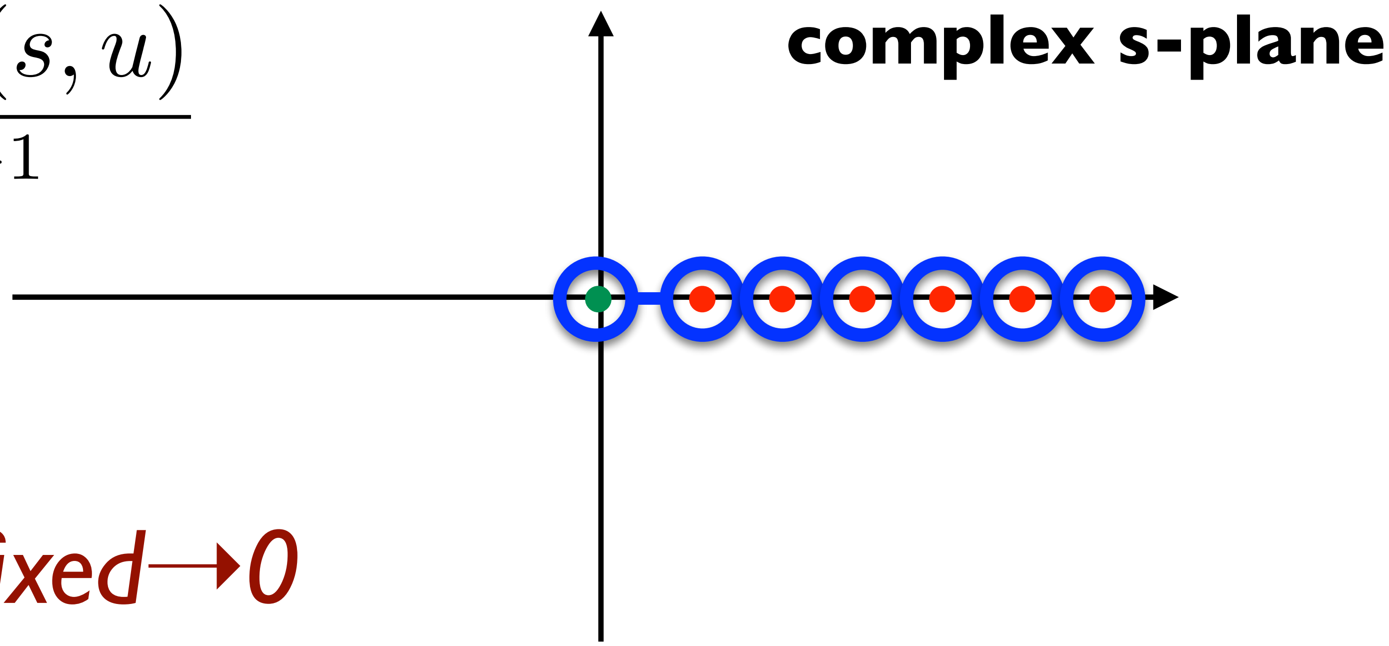
$\mathcal{M}_t^{I=2}$ cannot have poles in t

Working with $\mathcal{M}_t^{I=2}(s,u)$

(that cannot have poles in the t-channel)

crossing s↔u invariant

$$\frac{\mathcal{M}_t^{I=2}(s,u)}{s^{k+1}}$$



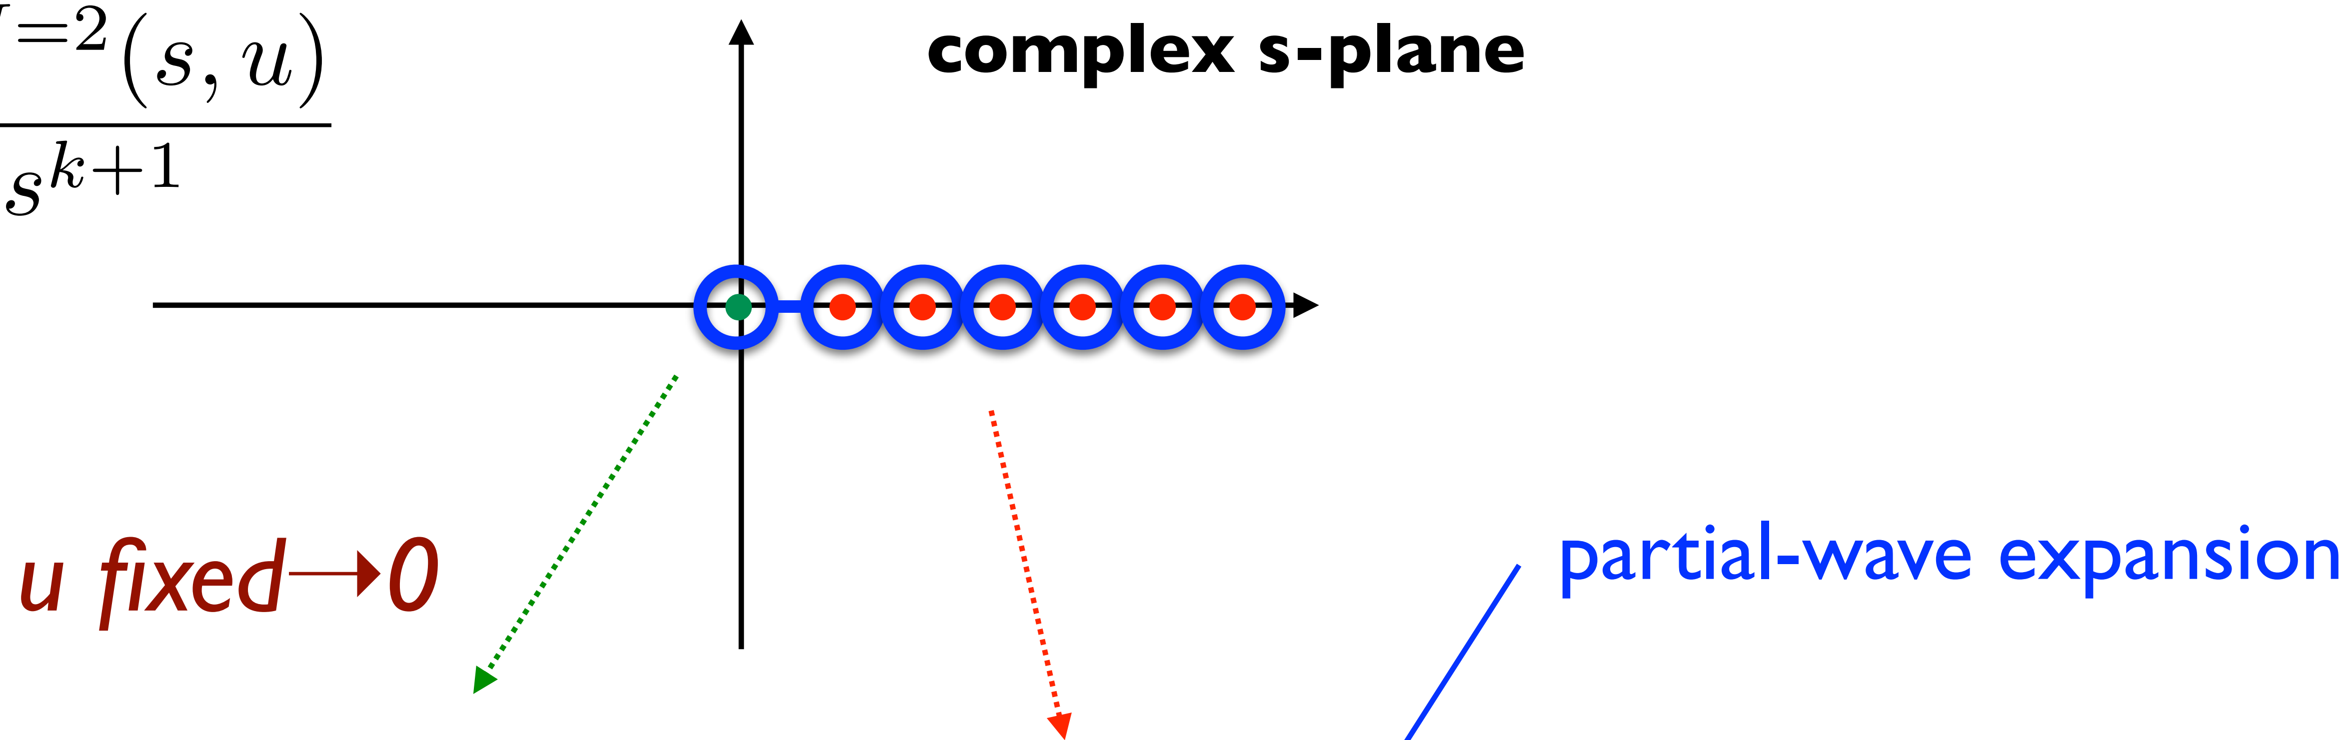
u fixed→0

Working with $\mathcal{M}_t^{I=2}(s,u)$

(that cannot have poles in the t-channel)

crossing s↔u invariant

$$\frac{\mathcal{M}_t^{I=2}(s,u)}{s^{k+1}}$$



$$\text{Res}\,\frac{\mathcal{M}_t^{I=2}(s,u)}{s^{k+1}} = \sum_i \frac{|g_{\pi\pi\,i}|^2}{m_i^{2k}} P_{J_i}\left(1+\frac{2u}{m_i^2}\right)$$

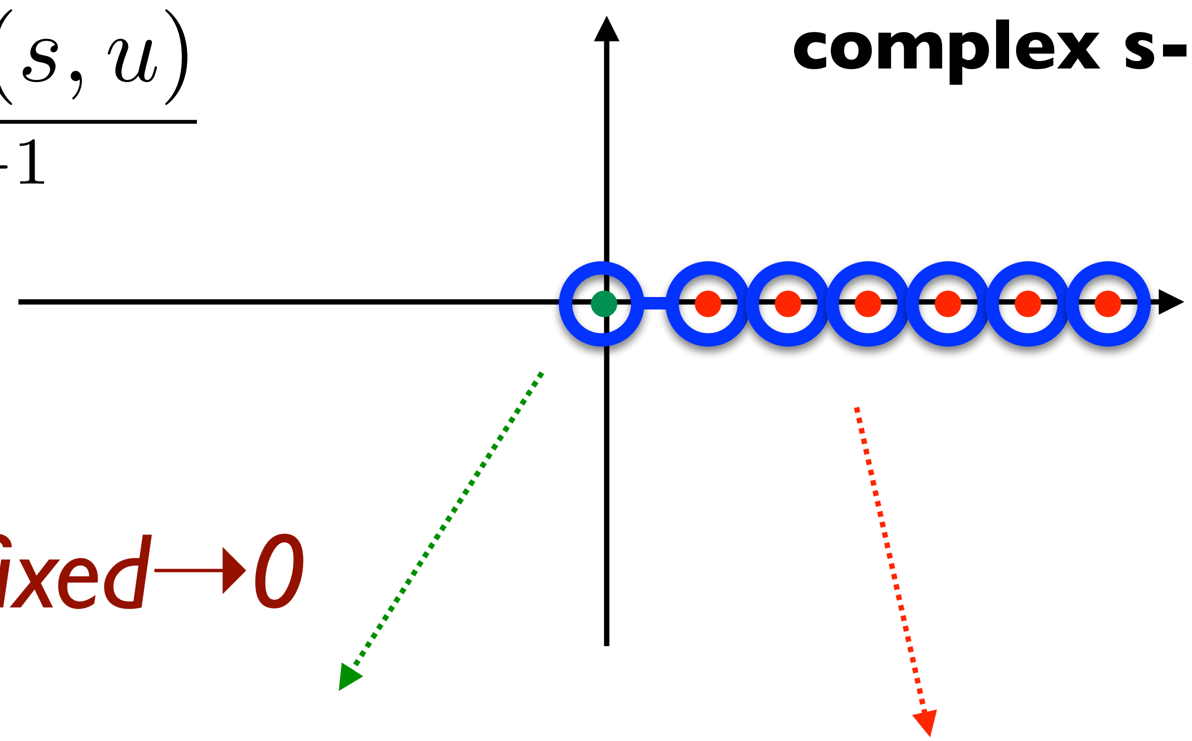
Working with $\mathcal{M}_t^{I=2}(s,u)$

(that cannot have poles in the t-channel)

crossing s↔u invariant

$$\frac{\mathcal{M}_t^{I=2}(s,u)}{s^{k+1}}$$

complex s-plane



u fixed→0

partial-wave expansion

$$\mathrm{Res}\,\frac{\mathcal{M}_t^{I=2}(s,u)}{s^{k+1}} = \sum_i \frac{|g_{\pi\pi\,i}|^2}{m_i^{2k}} P_{J_i}\left(1+\frac{2u}{m_i^2}\right)$$

Wilson coefficients

$$\mathcal{M}_t^{I=2}(s,u) \xrightarrow{s,u\to 0} g_{1,0}(s+u) + g_{2,0}(s^2+u^2) + g_{2,1}su + \cdots$$

Legendre pol. and derivatives (all positive!)

small u expansion:

$$k=1: \qquad g_{1,0}+g_{2,1}u+g_{3,1}u^2+\ldots = \sum_i |g_{\pi\pi\,i}|^2\left(\frac{P_{J_i}(1)}{m_i^2}+2\frac{P'_{J_i}(1)}{m_i^4}u+2\frac{P''_{J_i}(1)}{m_i^6}u^2+\ldots\right),$$

$$k=2: \qquad g_{2,0}+g_{3,1}u+g_{4,2}u^2+\ldots = \sum_i |g_{\pi\pi\,i}|^2\left(\frac{P_{J_i}(1)}{m_i^4}+2\frac{P'_{J_i}(1)}{m_i^6}u+2\frac{P''_{J_i}(1)}{m_i^8}u^2+\ldots\right),$$

C The su-models

Let us consider the most general theory of a degenerate spectrum that contributes to the four-pion amplitude $\mathcal{M}(s,u)$ [7, 8]. This means that all states have equal mass m, and therefore the denominator of this amplitude is fixed to be $\mathcal{M}(s,u) \propto 1/((s-m^2)(u-m^2))$. If we further demand that Eq. (6a) and Eq. (6b) are satisfied for $k_{\min}=1$, we are led to

$$\mathcal{M}(s,u) = \frac{a_1 m^4 + a_2 m^2 (s+u) + a_3 su}{(s-m^2)(u-m^2)}\,, \tag{91}$$

where a_i are constants. The Adler's zero condition fixes $a_1 = 0$. Then, aside from a global multiplicative factor, the amplitude has only one free parameter. We can write it as

$$\mathcal{M}_1^{(su)}(s,u) = \frac{m^2(s+u) + \lambda su}{(s-m^2)(u-m^2)}\,, \tag{92}$$

where the possible values of λ are determined by unitarity. Indeed, imposing the positivity of the residues of Eq. (92), we obtain

$$-2 \leq \lambda \leq \frac{2\ln 2 - 1}{1-\ln 2}\,. \tag{93}$$

In the limiting case $\lambda = -2$, the residues of all $J>0$ states are zero, and we are left with the scalar amplitude Eq. (22). In the other limit,

$$\lambda = \frac{2\ln 2 - 1}{1-\ln 2} \simeq 1.26\,, \tag{94}$$

D The Lovelace-Shapiro amplitude

The Lovelace-Shapiro (LS) amplitude for the scattering of four pions is defined as [26, 27]

$$\mathcal{M}^{(\mathrm{LS})}(s,u) = \frac{\Gamma(1-\alpha(s))\Gamma(1-\alpha(u))}{\Gamma(1-\alpha(s)-\alpha(u))} \ , \tag{105}$$

where $\alpha(s) = \alpha_0 + \alpha' s$ is referred as the Regge trajectory. We will fix the values of α_0 and α' by requiring that Eq. (106) satisfies the Adler zero condition, $\mathcal{M}^{(\mathrm{LS})}(s,u) \to 0$ for $s,u \to 0$, and that the first pole of Eq. (106) occurs for $s = m_\rho^2$. These two conditions lead to $\alpha_0 = 1/2$ and $\alpha' = 1/(2m_\rho^2)$ [66] and then we can write

$$\mathcal{M}^{(\mathrm{LS})}(s,u) = \frac{\Gamma\left(\frac{1}{2} - \frac{s}{2m_\rho^2}\right)\Gamma\left(\frac{1}{2} - \frac{u}{2m_\rho^2}\right)}{\Gamma\left(\frac{t}{2m_\rho^2}\right)} \ . \tag{106}$$

By looking at the poles of Eq. (106), one can see that the LS amplitude corresponds to a theory of higher-spin states with masses

$$m_n^2 = m_\rho^2(2n+1)\,, \quad n = 0,1,2,\ldots\,. \tag{107}$$

For a given n, there are at most $n+1$ states with spin $J = 0, 1, ..., n+1$. Furthermore, Eq. (106) satisfies the condition Eq. (6a) and Eq. (6b) with $k_{\min} = 1$.

E The Coon amplitude

The Lovelace-Shapiro amplitude presented in Appendix D can be generalized to a larger class of amplitudes depending on an additional parameter q. This is the so-called Coon amplitude, which was first proposed in [28][11]:

$$\mathcal{M}_q(s,u) = C(\sigma,\tau,q)\prod_{n=0}^{\infty}\frac{\left(1-q^{n+1}\right)\left(\sigma\tau-q^{n+1}\right)}{\left(\sigma-q^{n+1}\right)\left(\tau-q^{n+1}\right)}\ , \tag{118}$$

where $\sigma = 1+(q-1)(\alpha_0+\alpha' s)$ and $\tau = 1+(q-1)(\alpha_0+\alpha' u)$. As explained in Appendix D, we take $\alpha_0 = 1/2$ and $\alpha' = 1/(2m_\rho^2)$. The parameter q takes values between 0 and 1, and in the limit $q \to 1$ we recover the LS amplitude Eq. (106). There is some freedom in the choice of the prefactor C, as long as it satisfies $\lim_{q\to 1} C(\sigma,\tau,q) = 1$.

The Coon amplitude has an infinite number of simple poles at

$$s_n = m_\rho^2\frac{1+q-2q^{n+1}}{1-q}\ , \qquad n = 0,1,2,\dots\ . \tag{119}$$
