

12th Beam Telescopes and Test Beams Workshop

Contribution ID: 46

Type: **Talk**

Development of a flexible SCADA system for test beam environments

Monday 15 April 2024 14:50 (20 minutes)

The qualification of new detectors in test beam environments presents a dynamic setting that demands the stable operation of diverse devices equipped with different Data Acquisition (DAQ) systems. This complexity necessitates a system capable of controlling the data taking, monitoring the experimental setup, facilitating seamless configuration, and easy integration of new devices.

These requirements closely parallel the demands of a Supervisory Control And Data Acquisition (SCADA) system. Collaborative efforts between DESY, DvE, Lund University, and the University of Hamburg have led to the exploration of SCADA system concepts tailored for laboratory and test beam environments, resulting in the development of a new framework named Constellation.

In this contribution, a first implementation of a satellite (an element of a constellation) will be showcased. The concepts of Constellation, its current status, and an overview of the project will be presented.

Primary authors: SPANNAGEL, Simon (Deutsches Elektronen-Synchrotron (DE)); LACHNIT, Stephan (Deutsches Elektronen-Synchrotron (DE))

Co-authors: VAUTH, Annika (Universität Hamburg); PERREY, Hanno (Lund University); WENNLÖF, Håkan (Deutsches Elektronen-Synchrotron (DE)); BRYNGEMARK, Lene Kristian (Lund University (SE))

Presenter: LACHNIT, Stephan (Deutsches Elektronen-Synchrotron (DE))

Session Classification: DAQ systems
