About the NIAID International Program

- **Dual mission:** Conduct research into human diseases, and respond to outbreaks when they occur
- **Partners** with local scientists in disease-endemic countries to expand research capabilities/training of greatest relevance to the local population
- **Develops** laboratory, clinical field site, and information technology infrastructure through long-term collaborations
- **Collaborative research programs** underway at multiple national and international sites
- **Operate Research Infrastructure for the International Centers for Excellence in Research**

AFRICAN
ACCORD

X NIAID - BETHESDA

X NIAID - MALI

X NIAID - UGANDA

NIAID - Chennai, India

X NIAID - Phnom Penh, Cambodia

International Centers of Excellence in Research - ICERs

- Collaborative centers with a host institution
- NIH Grants have no indirect funding
- Cyberinfrastructure can't be built or maintained with direct grant funding
- ~2000 researchers and supporting staff

ACE-Uganda Compute Core

One Rack of Stampede Servers from the TACC

Retired to Sunny Uganda from Austin, Texas

- 40 8-core Xeon E5-2680 servers per rack
- ~12 kilowatts of power
- ~40,000 BTUs per hour

ACE Mali Cluster

- Combination of Proxmox for virtual machines and HPC for analysis
- 20 Server Nodes
- HPC - 696 total cores - 2028 GB RAM total
- Synology Storage Array - 150 TB
- Vmware platform: elwazi Gen3 platform funded by the NIH Data Science in Africa grants

Collaboration

Are you sharing data with a dog or a scientist?

All ICERs -

- Built authentication infrastructure
- Established identity assurance
- Multi-factor authentication
- Providing those to the federations
- Encouraged building of Federation in Uganda
- Encouraged building eduroam at the centers
- Encouraged use of the R&S Profile in India

Objective of the NDCP (NIAID VRO)

- **Researchers need access** to research protocol documentation, clinical information systems, outbreak monitoring tools, and more.
- External user accounts were extremely difficult to support, particularly in an international operational context (e.g., identity proofing, password resets).
- **Key insights:** Transition to campus identities, where local IT resources are already in place to handle credentialing and authenticator support. Decorate campus IDs with authorization data for use by multiple scientific applications.

Recent Accomplishments

- Dynamic MFA
- Implemented RAF 1.0 identity proofing at NIAID ICERs in Uganda, Mali
- Assisted RAF 2.0 development—international ID proofing framework <https://refeds.org/assurance>
- Expanded collaborative research services—
 - Study data visualization (Tableau)
 - Specimen management (FreezerPro, Freezerworks)
 - Environmental monitoring (DicksonOne)
 - ORCID iD integration

Challenges

- **Provision scientists quickly** as part of pandemic response.
- **Handle variations** in campus IAM standards and practices.
- **Enroll users in MFA** when not supported by campus IT.
- **Integrate systems** from a wide variety of vendors.
- **Building Trust** at the top of the organization
 - Mapping international standards to the local regulations and bureaucracy

Next Steps

- Rebranding after pilot
- Begin accepting subject ID/pairwise ID and RAF 2.0 IAP High
- Migrate select SPs from SAML to OIDC
- Develop automated validation for the NDCP and integrated research applications
- Install and operate open-on demand for HPC at the centers in Mali and Uganda

Building the community requires constant investment

- RAF Working Group
- Baseline Expectations 1 & 2
- CTAB
- TAC
- FIM4R
