The bigger picture

A simple calculation (?)

$\gamma^\mu = \begin{bmatrix} 0 & \sigma^\mu \\ \bar{\sigma}^\mu & 0 \end{bmatrix}$
 $\sigma^0 = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$
 $\sigma^1 = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$
 $\sigma^2 = \begin{bmatrix} i & 0 \\ 0 & -i \end{bmatrix}$
 $\sigma^3 = \begin{bmatrix} 1 & 0 \\ 0 & -1 \end{bmatrix}$

$\bar{\sigma}^0 = \sigma^0$, $\bar{\sigma}^{1,2,3} = -\sigma^{1,2,3}$

$u^h(p_2) = \begin{pmatrix} \sqrt{p_2 \cdot \sigma} \xi^h \\ \sqrt{p_2 \cdot \bar{\sigma}} \xi^h \end{pmatrix}$

$\bar{v}^h(p_1) = v^{h\dagger}(p_1) \gamma^0$

$\bar{u}^h(p_3) = u^{h\dagger}(p_3) \gamma^0$

$v^h(p_4) = \begin{pmatrix} \sqrt{p_4 \cdot \sigma} \xi^h \\ \sqrt{p_4 \cdot \bar{\sigma}} \xi^h \end{pmatrix}$

$\sum_{\mu\nu} \bar{v}^h(p_1) i \not{q} \gamma^\mu u^h(p_2) \frac{(-i) g_{\mu\nu}}{(p_1 + p_2)^2} \bar{u}^h(p_3) i \not{q} \gamma^\nu v^h(p_4)$

$\sum_{\mu} \left(\begin{matrix} \text{---} \end{matrix} \right)^\mu \left| \begin{matrix} \text{---} \end{matrix} \right|$

4×4

In QCD we translate color to flows

- For the strong force (QCD) we have color as well: For each quark-gluon vertex a factor t_{ij}^a , a generator of SU(3), i.e., a matrix giving an infinitesimal rotation of a complex three-component vector
- Fierz identity (here $T_R = 1$)

$$\underbrace{\begin{array}{ccc} i \longrightarrow & & \longrightarrow j \\ & \text{g} & \\ k \longleftarrow & & \longleftarrow l \end{array}}_{t_{ij}^g t_{lk}^g} = \underbrace{\begin{array}{ccc} i \longrightarrow & & \longrightarrow j \\ & | & \\ k \longleftarrow & & \longleftarrow l \end{array}}_{\delta_{ik} \delta_{lj}} - \frac{1}{N} \underbrace{\begin{array}{ccc} i \longrightarrow & & \longrightarrow j \\ & & \\ k \longleftarrow & & \longleftarrow l \end{array}}_{\delta_{ij} \delta_{lk}}$$

SU($N = 3$) remove gluon indices

- The Dirac spinor structure transforms under the direct sum representation $\underbrace{\left(\frac{1}{2}, 0\right)}_{\text{left}} \oplus \underbrace{\left(0, \frac{1}{2}\right)}_{\text{right}}$ in the chiral/Weyl basis

$$\begin{pmatrix} u_L \\ u_R \end{pmatrix} \rightarrow \begin{pmatrix} e^{-i\bar{\theta} \cdot \frac{\bar{\sigma}}{2} + \bar{\eta} \cdot \frac{\bar{\sigma}}{2}} & 0 \\ 0 & e^{-i\bar{\theta} \cdot \frac{\bar{\sigma}}{2} - \bar{\eta} \cdot \frac{\bar{\sigma}}{2}} \end{pmatrix} \begin{pmatrix} u_L \\ u_R \end{pmatrix}$$

- i.e. actually two copies of $\mathbf{SL}(2, \mathbb{C})$, infinitesimally two $su(2)$
- Consider the matrix

$$p^{\dot{\alpha}\beta} = (p_\mu \sigma^\mu)^{\dot{\alpha}\beta} = \begin{pmatrix} p_0 + p_3 & p_1 - ip_2 \\ p_1 + ip_2 & p_0 - p_3 \end{pmatrix}^{\dot{\alpha}\beta}$$

If we transform this as indicated by the indices $\Lambda^{\dot{\alpha}}_{\dot{\beta}} \Lambda^{\alpha}_{\beta} p^{\dot{\beta}\beta}$, we recover the transformation of a four-vector!

- Lorentz group \sim two copies of $su(2)$, $so(3, 1) \cong su(2) \oplus su(2)$
- Can we do something similar for the Lorentz structure?

- Consider massless particles: chirality \sim helicity
- Spinors (in notation from the spinor-helicity formalism)

$$u^+(p) = v^-(p) = \begin{pmatrix} 0 \\ |p\rangle \end{pmatrix} \quad u^-(p) = v^+(p) = \begin{pmatrix} |p] \\ 0 \end{pmatrix}$$

$$\bar{u}^+(p) = \bar{v}^-(p) = \left([p|, 0 \right) \quad \bar{u}^-(p) = \bar{v}^+(p) = \left(0, \langle p| \right)$$

Note that incoming particles and antiparticles have bracket type corresponding to their helicity, but outgoing have the opposite

- Amplitudes have to be Lorentz invariant
- Lorentz inner products formed using **the only $SL(2, \mathbb{C})$ invariant object** $\epsilon^{\alpha\beta}$, $\epsilon^{12} = -\epsilon^{21} = \epsilon_{21} = -\epsilon_{12}$

$$\underbrace{\epsilon^{\alpha\beta} |i\rangle_\beta |j\rangle_\alpha}_{\equiv \langle i|^\alpha} = \langle i|^\alpha |j\rangle_\alpha = \langle ij \rangle, \quad \underbrace{\epsilon_{\dot{\alpha}\dot{\beta}} |i\rangle^{\dot{\beta}} |j\rangle^{\dot{\alpha}}}_{\equiv [i|_{\dot{\alpha}}} = [i|_{\dot{\alpha}} |j\rangle^{\dot{\alpha}} = [ij],$$

where $|j\rangle^{\dot{\alpha}} = |p_j\rangle^{\dot{\alpha}}$ etc.

- \implies Amplitudes are built up of contractions of form $\langle ij \rangle, [ij] \sim \sqrt{s_{ij}}$
- If we manage to create a flow picture, the “flow” must contract **dotted** and **undotted** indices separately

- First step: Notation for spinor inner products (only possible Lorentz invariants)

$$\langle i |^\alpha | j \rangle_\alpha \equiv \langle ij \rangle = -\langle ji \rangle = i \xrightarrow{\hspace{1cm}} j$$

$$[i |_\beta | j]^\beta \equiv [ij] = -[ji] = i \xrightarrow{\hspace{1cm}} j$$

- Spinors and Kronecker deltas

$$\langle i |^\alpha = \bullet \xleftarrow{\hspace{1cm}} i$$

$$| j \rangle_\alpha = \bullet \xrightarrow{\hspace{1cm}} j$$

$$[i |_\beta = \bullet \xleftarrow{\hspace{1cm}} i$$

$$| j]^\beta = \bullet \xrightarrow{\hspace{1cm}} j$$

$$\delta_\alpha^\beta \equiv \mathbb{1}_\alpha^\beta = \alpha \xrightarrow{\hspace{1cm}} \beta$$

$$\delta_{\dot{\alpha}}^{\dot{\beta}} \equiv \mathbb{1}_{\dot{\alpha}}^{\dot{\beta}} = \dot{\beta} \xrightarrow{\hspace{1cm}} \dot{\alpha}$$

Non-matching arrows?

Arrows opposed? Flip them (when contracted between external spinors) First use charge conjugation

$$\underbrace{i \xrightarrow{\text{red}} \text{wavy} \xrightarrow{\text{blue}} j}_{\langle i | \alpha \bar{\tau}^\mu_{\alpha\dot{\beta}} | j \rangle^{\dot{\beta}}} = \underbrace{i \xleftarrow{\text{red}} \text{wavy} \xleftarrow{\text{blue}} j}_{[j | \dot{\alpha} \tau^\mu, \dot{\alpha}\beta | i \rangle_\beta}$$

Then use Fierz identity $\bar{\tau}^\mu_{\alpha\dot{\beta}} \tau_\mu^{\dot{\gamma}\eta} = \delta_\alpha^\eta \delta_{\dot{\beta}}^{\dot{\gamma}}$ to remove vector index

$$\underbrace{1 \xrightarrow{\text{red}} \text{wavy} \xrightarrow{\text{blue}} 2}_{\langle 1 | \alpha \bar{\tau}^\mu_{\alpha\dot{\beta}} | 2 \rangle^{\dot{\beta}}} \underbrace{4 \xleftarrow{\text{blue}} \text{wavy} \xleftarrow{\text{red}} 3}_{\langle 3 | \gamma \bar{\tau}_{\mu, \gamma\dot{\eta}} | 4 \rangle^{\dot{\eta}}} = \underbrace{1 \xrightarrow{\text{red}} \text{wavy} \xrightarrow{\text{blue}} 2}_{\langle 1 | \alpha \bar{\tau}^\mu_{\alpha\dot{\beta}} | 2 \rangle^{\dot{\beta}}} \underbrace{4 \xrightarrow{\text{blue}} \text{wavy} \xrightarrow{\text{red}} 3}_{\langle 4 | \dot{\eta} \tau_\mu^{\dot{\eta}\gamma} | 3 \rangle_\gamma} = \underbrace{1 \xrightarrow{\text{red}} \text{cross} \xrightarrow{\text{blue}} 2}_{\langle 13 \rangle} \underbrace{4 \xrightarrow{\text{blue}} \text{cross} \xrightarrow{\text{red}} 3}_{[42]}$$

flipped

Fermion propagators

- We split $\not{p}_{4d} \equiv p_\mu \gamma^\mu = p_\mu \sqrt{2} \begin{pmatrix} 0 & \tau^\mu \\ \bar{\tau}^\mu & 0 \end{pmatrix}$ into two terms

$$\not{p} \equiv \sqrt{2} p^\mu \tau_\mu^{\dot{\alpha}\beta} = \begin{array}{c} p \\ \text{---} \bullet \text{---} \end{array} \quad \bar{\not{p}} \equiv \sqrt{2} p_\mu \bar{\tau}^\mu_{\alpha\dot{\beta}} = \begin{array}{c} p \\ \text{---} \bullet \text{---} \end{array}$$

- For massless momenta we have

$$\sqrt{2} p^\mu \tau_\mu \equiv \not{p} = |p\rangle\langle p|, \quad \sqrt{2} p^\mu \bar{\tau}_\mu \equiv \bar{\not{p}} = |p\rangle[p|$$

- In a propagator, we have $p^\mu = \sum p_i^\mu$, $p_i^2 = 0$

$$\not{p} = \begin{array}{c} \sum_i p_i \\ \text{---} \bullet \text{---} \end{array} = \sum_i |i\rangle\langle i| \quad \text{for } p_i^2 = 0$$

$$\bar{\not{p}} = \begin{array}{c} \sum_i p_i \\ \text{---} \bullet \text{---} \end{array} = \sum_i |i\rangle_\alpha [i|_\beta \quad \text{for } p_i^2 = 0$$

External gauge bosons

- In the spinor-helicity formalism

$$\epsilon_L^\mu(p, r) \rightarrow \frac{|r\rangle[p|}{\langle rp\rangle} \text{ or } \frac{[p]\langle r|}{\langle rp\rangle}, \quad \epsilon_R^\mu(p, r) \rightarrow \frac{|r]\langle p|}{[pr]} \text{ or } \frac{[p]\rangle[r|}{[pr]}$$

- \implies easy to translate to chirality flow

$$\begin{aligned} \epsilon_L^\mu(p, r) &\rightarrow \frac{1}{\langle rp\rangle} \text{ (diagram: dot, red arrow } p \leftarrow r \text{, blue dashed arrow } p \leftarrow r \text{)} , & \text{ or } & \epsilon_L^\mu(p, r) \rightarrow \frac{1}{\langle rp\rangle} \text{ (diagram: dot, red arrow } r \leftarrow p \text{, blue dashed arrow } r \leftarrow p \text{)} \\ \epsilon_R^\mu(p, r) &\rightarrow \frac{1}{[pr]} \text{ (diagram: dot, red arrow } r \leftarrow p \text{, blue dashed arrow } p \leftarrow r \text{)} , & \text{ or } & \epsilon_R^\mu(p, r) \rightarrow \frac{1}{[pr]} \text{ (diagram: dot, red arrow } p \leftarrow r \text{, blue dashed arrow } r \leftarrow p \text{)} \end{aligned}$$

- In a Feynman diagram choose arrow directions which give aligned arrows through momentum dots, and opposing arrows for the two spinors of a gauge boson. (After careful consideration one can prove that this flow picture always works.)

The QED flow rules: massless particles

Species	Feynman	Flow
$\bar{u}^R(p_i)$		
$v^R(p_j)$		
$v^L(p_j)$		
$\bar{u}^L(p_i)$		
$\epsilon_R^\mu(p_i, r)$		$\frac{1}{[ir]}$ or $\frac{1}{[ir]}$
$\epsilon_L^\mu(p_i, r)$		$\frac{1}{\langle ri \rangle}$ or $\frac{1}{\langle ri \rangle}$

Use **left** and **right** chiral spinors $\underbrace{su(2)}_{\text{dotted}}$, $\underbrace{su(2)}_{\text{undotted}}$ and R/L for outgoing $-/+$

helicity (A. Lifson, C. Reuschle and MS, 2003.05877 (EPJC))

The QED flow rules: vertices and propagators

Stitch together such that arrow directions match

Simplest QED example

- Ordinary Feynman diagrams

$$= \frac{ie^2}{s_{e^+e^-}} \bar{v}^+(p_2) \gamma^\mu u^-(p_1) \bar{u}^+(p_4) \gamma_\mu v^-(p_3) = \dots$$

- Regular spinor-helicity, easy

$$= \frac{2ie^2}{s_{e^+e^-}} ([2|\dot{\alpha} \tau_\mu^{\dot{\alpha}\beta} |1\rangle_\beta) (\langle 4|^\alpha \bar{\tau}_{\alpha\dot{\beta}}^\mu |3]^\dot{\beta})$$

$$= \frac{2ie^2}{s_{e^+e^-}} [2|\dot{\alpha} |3]^\dot{\alpha} \langle 4|^\beta |1\rangle_\beta \equiv \frac{2ie^2}{s_{e^+e^-}} [23] \langle 41 \rangle$$

Simplest QED example

- Chirality flow, super easy and intuitive

- TODO: A slightly more complicated example on the board

A complicated QED example

- Pick any consistent arrow direction
- Compare to standard QFT: 12 γ^μ matrices
- Here all particles crossed to outgoing

$$= \underbrace{(\sqrt{2}ei)^8}_{\text{vertices}} \underbrace{(-i)^3}_{s_8^R r_8} \underbrace{(i)^4}_{s_9^R r_9} \underbrace{\frac{1}{[8r_8][9r_9]}}_{\text{polarization vectors}} [15]\langle 64\rangle[10 r_9]$$

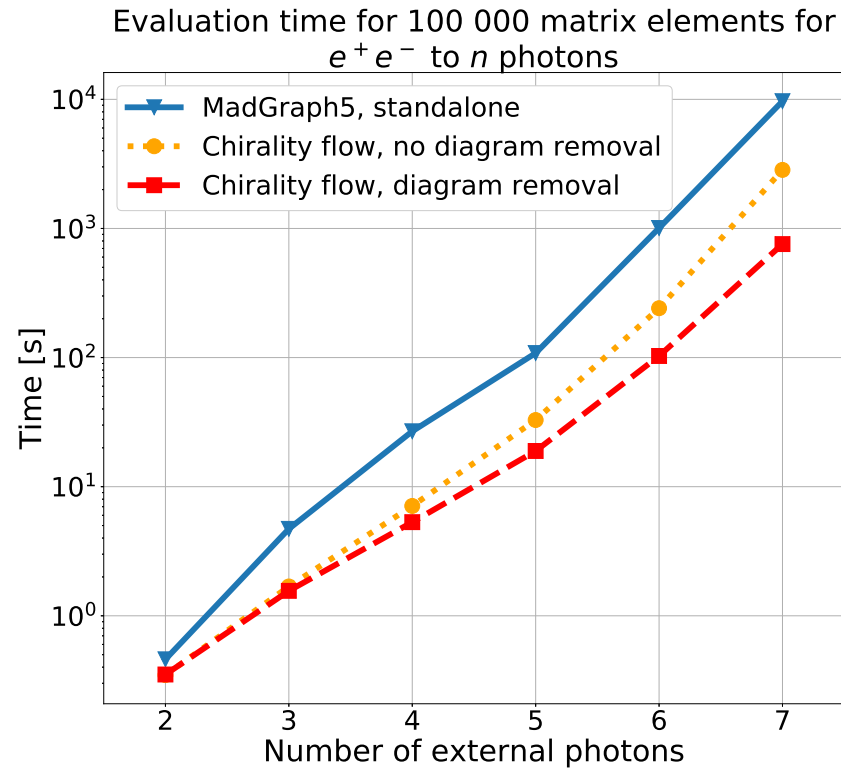

photon propagators
fermion propagators
polarization vectors

$$\times \left(\underbrace{\langle 99\rangle[9r_8] + \langle 910\rangle[10r_8]}_0 \right) \left(\underbrace{[33]\langle 37\rangle + [34]\langle 47\rangle + [36]\langle 67\rangle}_0 \right)$$

$$\times \left(-\langle 89\rangle[91]\langle 12\rangle - \langle 89\rangle[95]\langle 52\rangle - \langle 810\rangle[101]\langle 12\rangle - \langle 810\rangle[105]\langle 52\rangle \right)$$

Implementation

Evaluation time in MadGraph5_aMC@NLO, $e^+e^- \rightarrow n$ photons
(A. Lifson, M. Sjö Dahl and Z. Wettersten 2203.13618 (EPJC))

Massive momenta and spinors

- Decompose massive momentum p as sum of massless
 $p^\mu = p^{b,\mu} + \alpha q^\mu$, $(p^b)^2 = q^2 = 0$, $\alpha = \frac{p^2}{2p \cdot q} = \frac{m^2}{2p \cdot q}$
 $\not{p} \equiv \sqrt{2} p^\mu \tau_\mu = |p^b\rangle\langle p^b| + \alpha |q\rangle\langle q|$
- Massive spinors and polarization vectors written in terms of massless Weyl spinors of momentum p^b, q ,

$$u^+(p) = \begin{pmatrix} -\frac{m}{[qp^b]} \text{ (grey circle)} \xrightarrow{\text{dashed blue arrow}} q \\ \text{ (grey circle)} \xrightarrow{\text{solid red arrow}} p^b \end{pmatrix}, \text{ etc.}$$

(All spinors in 2011.10075 eq. 3.11-3.16)

- q is arbitrary but physical, as it defines the spin direction s^μ

$$s^\mu = \frac{1}{m} (p^\mu - 2\alpha q^\mu) = \frac{1}{m} \left(p^\mu - \frac{m^2}{p \cdot q} q^\mu \right)$$

- Can also measure spin along the direction of motion

$$p^\mu = p_f^\mu + p_b^\mu$$

$$\alpha \rightarrow 1,$$

$$p^b \rightarrow p_f = \frac{p^0 + |\vec{p}|}{2} (1, \hat{p})$$

$$q \rightarrow p_b = \frac{p^0 - |\vec{p}|}{2} (1, -\hat{p})$$

Spin measured along $s^\mu = \frac{1}{m} (p_f^\mu - p_b^\mu) = \frac{1}{m} (|\vec{p}|, p^0 \hat{p})$, spatial components along the direction of motion

(Full Standard Model in J. Alnefjord, A.Lifson, C.Reuschle and M. Sjodahl 2011.10075 (EPJC))

What is spin?

- Spin operator Σ^μ and Pauli-Lubanski operator W^μ

$$\frac{1}{2}\Sigma^\mu = -\frac{1}{4m}\epsilon^{\mu\nu\lambda\omega}P_\nu\sigma_{\lambda\omega} = \frac{1}{m}W^\mu$$

- Here $W^2 = -m^2 J(J+1)$, is the 2nd quadratic Casimir operators of the Poincaré algebra, along $P^2 = m^2$, ($P_\nu = i\partial/\partial x^\nu$), and $\sigma^{\mu\nu}$ (giving the Lorentz generators for the $(1/2, 1/2)$ -representation) is defined as $\sigma^{\mu\nu} = \frac{i}{2}[\gamma^\mu, \gamma^\nu]$.
- The spin projected onto s^μ is given by the operator

$$\mathcal{O}_s = -\frac{\Sigma^\mu s_\mu}{2} = \frac{1}{4m}\epsilon^{\mu\nu\lambda\omega} s_\mu P_\nu \sigma_{\lambda\omega} ,$$

such that the spin direction, in this sense, is only defined up to a four-momentum proportional to p .

- Adding any linear combination of p to $s = (1/m)(p - 2\alpha q)$ leaves \mathcal{O}_s invariant
- Therefore, we could equally well have used $s' = -2\alpha q/m = -mq/(p \cdot q)$ for the spin direction, when expressed as above. When rewritten as $\mathcal{O}_s = \frac{1}{2}\gamma^5 s^\mu \gamma_\mu$ the spin vector must be taken to be s .
- Thus q plays the role of defining the *other* four-vector (aside from p) which determines the operator \mathcal{O}_s , and thereby what we mean with positive and negative spin.
- In the non-relativistic limit $p = (m, 0, 0, 0)$ and $s = (0, \hat{s})$. Clearly, adding any linear combination of p to s or q will leave \mathcal{O}_s invariant.

Fermion vertices

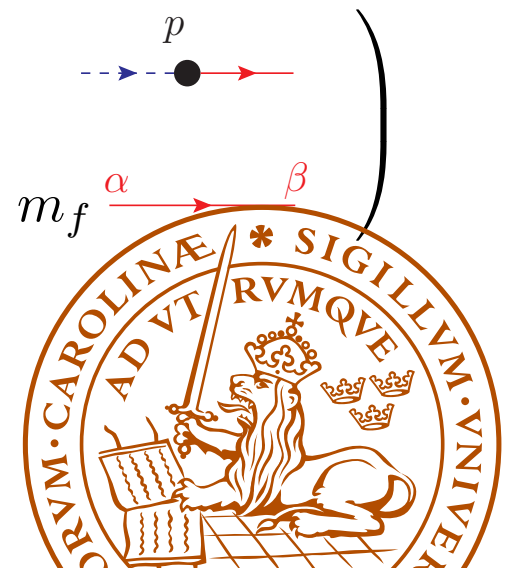

- Fermion-vector vertex

$$\begin{array}{c} \text{---} \\ \text{---} \end{array} \text{---}^{\mu} = ie(P_L C_L + P_R C_R) \gamma^{\mu} = ie\sqrt{2} \left(\begin{array}{cc} 0 & C_R \\ C_L & 0 \end{array} \right)$$

Left and right chiral couplings may differ, in particular $C_R = 0$ for $W^{\pm} \Rightarrow$ **electroweak sector nice** in chirality flow

- Fermion propagator

$$\frac{i}{p^2 - m_f^2} \begin{pmatrix} m_f \delta_{\dot{\alpha}\dot{\beta}} & \sqrt{2} p^{\dot{\alpha}\dot{\beta}} \\ \sqrt{2} \bar{p}_{\alpha\dot{\beta}} & m_f \delta_{\alpha\beta} \end{pmatrix} = \frac{i}{p^2 - m_f^2} \begin{pmatrix} m_f \begin{array}{c} \dot{\alpha} \text{---} \text{---} \dot{\beta} \\ \text{---} \end{array} & \begin{array}{c} p \\ \text{---} \end{array} \\ \begin{array}{c} \text{---} \\ p \end{array} & m_f \begin{array}{c} \alpha \text{---} \text{---} \beta \\ \text{---} \end{array} \end{pmatrix}$$

A massive example

Consider the diagram of $e_{1+}^+ e_{2-}^- \rightarrow \gamma_{3-}^{=R} \gamma_{4+}^{=L}$ and include the mass m_e

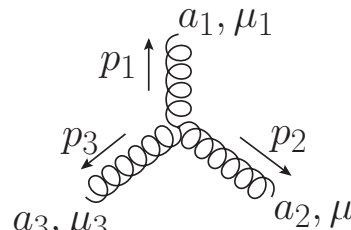

- Obtain 3 new terms
- Simplify with choices of q_1, q_2, r_3, r_4
 $q_2 = p_3, r_3 = p_2^b \dots$

$$= \frac{-2ie^2}{((p_4 - p_1)^2 - m_e^2) [3r_3] \langle 4r_4 \rangle} \left\{ \begin{array}{l} \begin{array}{c} p_2^b \text{---} r_3 \\ \text{---} 3 \\ \bullet \text{---} p_4 - p_1^b - q_1 \\ \text{---} 4 \\ p_1^b \text{---} r_4 \end{array} - \frac{m_e}{[q_1 p_1^b]} \frac{m_e}{\langle p_2^b q_2 \rangle} \begin{array}{c} q_2 \text{---} 3 \\ \text{---} r_3 \\ \bullet \text{---} p_4 - p_1^b - q_1 \\ \text{---} r_4 \\ q_1 \text{---} 4 \end{array} \\ \\ + m_e \left(\frac{m_e}{\langle p_2^b q_2 \rangle} \begin{array}{c} q_2 \text{---} 3 \\ \text{---} r_3 \\ \text{---} 4 \\ p_1^b \text{---} r_4 \end{array} - \frac{m_e}{[q_1 p_1^b]} \begin{array}{c} p_2^b \text{---} r_3 \\ \text{---} 3 \\ \text{---} r_4 \\ q_1 \text{---} 4 \end{array} \right) \end{array} \right.$$

The non-abelian QCD vertices

$$= i \frac{g_s}{\sqrt{2}} i f^{a_1 a_2 a_3} \left(g^{\mu_1 \mu_2} (p_1 - p_2)^{\mu_3} + g^{\mu_2 \mu_3} (p_2 - p_3)^{\mu_1} + g^{\mu_3 \mu_1} (p_3 - p_1)^{\mu_2} \right)$$

$$\rightarrow i \frac{g_s}{\sqrt{2}} i f^{a_1 a_2 a_3} \frac{1}{\sqrt{2}} \left(\begin{array}{c} 1 \\ \text{---} \\ p_1 - p_2 \\ \text{---} \\ 3 \end{array} + \begin{array}{c} 1 \\ \text{---} \\ p_2 - p_3 \\ \text{---} \\ 3 \end{array} + \begin{array}{c} 1 \\ \text{---} \\ p_3 - p_1 \\ \text{---} \\ 3 \end{array} \right),$$

Here f^{abc} is the color factor in the vertex, the SU(3) structure constants (A.Lifson, C.Reuschle and M. Sjudahl 2011.10075 (EPJC))

$$\begin{aligned}
& \begin{array}{c} \mu_1, a_1 \quad \mu_2, a_2 \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ \mu_4, a_4 \quad \mu_3, a_3 \end{array} = i \left(\frac{g_s}{\sqrt{2}} \right)^2 \sum_{Z(2,3,4)} i f^{a_1 a_2 b} i f^{b a_3 a_4} \left(g^{\mu_1 \mu_3} g^{\mu_2 \mu_4} - g^{\mu_1 \mu_4} g^{\mu_2 \mu_3} \right) \\
& \rightarrow i \left(\frac{g_s}{\sqrt{2}} \right)^2 \sum_{Z(2,3,4)} i f^{a_1 a_2 b} i f^{b a_3 a_4} \left(\begin{array}{c} 1 \quad 2 \\ \diagdown \quad \diagup \\ \diagup \quad \diagdown \\ 4 \quad 3 \end{array} - \begin{array}{c} 1 \quad 2 \\ | \quad | \\ 4 \quad 3 \end{array} \right)
\end{aligned}$$

where $Z(2, 3, 4)$ denotes the set of cyclic permutations of the integers 2, 3, and 4

TODO: A QCD example on the board...

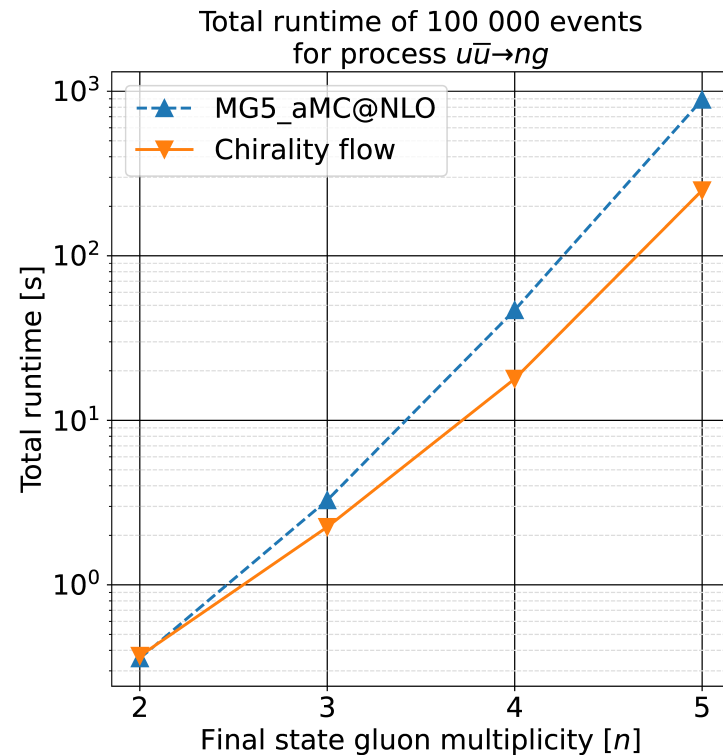

The gluon vertices can be simplified due to a nice gauge choice, for example, we can not have three left gluons

The four-gluon vertex simplifies further due to the Schouten identity

Implementation

Runtime for the Lorentz structure of $u\bar{u} \rightarrow ng$ for the standalone version of MadGraph5_aMC@NLO and for the chirality-flow branch.

(E. Boman, A. Lifson, M. Sjodahl, A. Warnerbring, Z. Wettersten, 2312.07447 (JHEP))

Implementation

Runtime for the Lorentz structure of $gg \rightarrow t\bar{t} + ng$, for the standalone version of MadGraph5_aMC@NLO and for the chirality-flow branch. (E. Boman, A. Lifson, M. Sjodahl, A. Warnerbring, Z. Wettersten, 2312.07447 (JHEP))

Electroweak physics

- This sector is chiral \rightarrow largest amount of simplification expected
- In particular the W^\pm vertex is simple
- TODO: Consider W exchange

Electroweak physics

- This sector is chiral \rightarrow largest amount of simplification expected
- In particular the W^\pm vertex is simple

Assume positive spin along $s_1^\mu = \frac{1}{m_1} (p_1^\mu - \frac{m_1^2}{p_1 \cdot q} q^\mu)$

$$u^+(p_1) = \begin{pmatrix} -\frac{m_1}{[q p_1^\mu]} & \text{O} \rightarrow \text{---} q \\ \text{O} \rightarrow \text{---} p_1^b & \text{X} \end{pmatrix}$$

then particle 4 can not have q for its left spinor

$$\Rightarrow v^+(p_4) = \begin{pmatrix} \text{O} \rightarrow \text{---} p_4^b & \text{X} \\ -\frac{m_4}{\langle p_4 q \rangle} & \text{O} \rightarrow \text{---} q \end{pmatrix} \Rightarrow \left\{ \begin{array}{l} \text{particle 4 has} \\ \text{positive spin along} \\ s_4^\mu = \frac{1}{m_4} (p_4^\mu - \frac{m_4^2}{p_4 \cdot q} q^\mu) \end{array} \right.$$

only one possible chirality flow

Conclusion and outlook

- Splitting Lorentz structure into $su(2)$, $su(2)$, we are able to recast all standard model Feynman rules to chirality-flow rules
- This gives a transparent and intuitive way of **writing down values of Feynman diagrams**, simplifying pen-and paper calculations to the extent that they are often trivial
- Vertices can be simplified by good gauge choices, and the four-gluon vertex further by the Schouten identity
- Significant speed-up for event generation

Backup: Massive polarization vectors

External gauge bosons, for helicity states $p^b \rightarrow p_f, \alpha \rightarrow 1, q \rightarrow p_b$

$$\epsilon_L^\mu(p) \rightarrow \frac{|p^b\rangle\langle q|}{\langle qp^b\rangle} \quad \text{or} \quad \frac{|q\rangle[p^b]}{\langle qp^b\rangle} \quad \epsilon_R^\mu(p) \rightarrow \frac{|q\rangle\langle p^b|}{[p^b q]} \quad \text{or} \quad \frac{|p^b\rangle[q]}{[p^b q]}$$

$$\epsilon_0^\mu(p) = s^\mu = \frac{1}{m}(p^{b,\mu} - \alpha q^\mu)$$

for incoming (outgoing) bosons, use L/R for $-/+ (-/+)$ spin along s^μ -axis. Translate to chirality flow
