

# Classifying the CP properties of the ggH coupling in $H+2j$ production

---

WG2 / WG3 joint meeting

26.09.2023

Henning Bahl, Elina Fuchs, Marc Hannig and Marco Menen

[2309.03146]

# Overview & Motivation

---

## The need for CP violation:

- CP violation is necessary to explain the baryon asymmetry of the universe
- SM does not contain enough CP violation for this
- Current experimental limits leave room for CP violation in the Higgs sector

CMS '21, ATLAS '21, ATLAS '22, CMS '22

## Why use ggF + 2j as a CP test?

- Gluon fusion is the main Higgs production mode at the LHC  $\Rightarrow$  lots of events
- 2 jets in the final state are needed to construct CP-odd observables
- More direct probe of the top-Yukawa coupling than simple rate information

Klamke & Zeppenfeld '07, Demartin et al. '14

# Signal & Background processes

$gg$

72%

$gq$

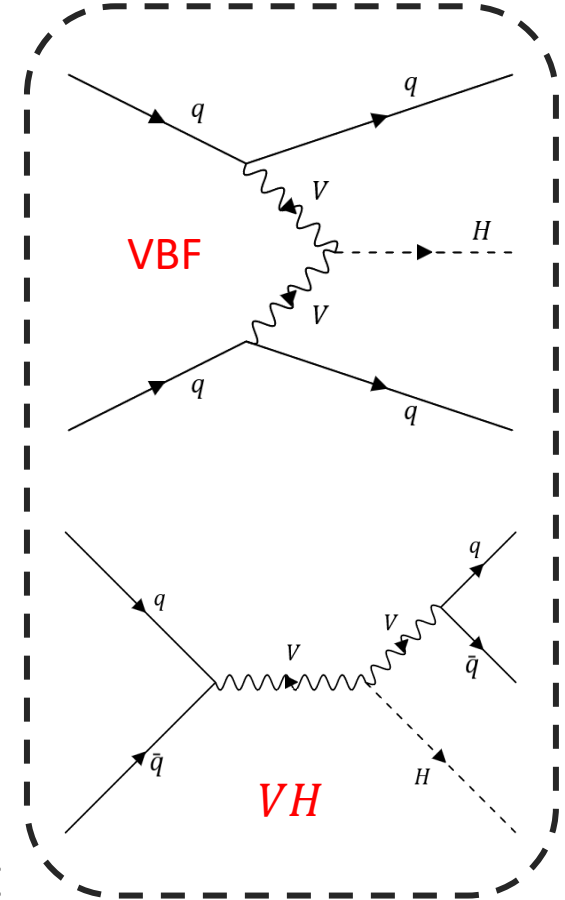

26.5%

$q\bar{q}$

1.5% @13TeV

$$\frac{\sigma_{\text{init}}}{\sigma_{\text{ggF2j}}} =$$

- **ggF2j** shows different topologies based on the initial state
- High CP sensitivity in  $q\bar{q}$  initial states? [Hagiwara et al. '09](#)
- Considered background (BG) processes: VBF and  $VH$
- $H \rightarrow \gamma\gamma$  decay: non-Higgs BG smoothly falling, easy to subtract

- Many analyses consider only signal region with VBF-like kinematics [CMS '22](#)

# BSM framework

---

## Free parameters:

- Higgs characterisation model: Higgs  $H$  assumed to be mixed CP state
- Effective Higgs-gluon coupling:

Artoisenet et al. '13

$$\mathcal{L}_{ggH} = -\frac{1}{4v} \left( -\frac{\alpha_s}{3\pi} c_g G_{\mu\nu}^a G^{\mu\nu,\alpha} + \frac{\alpha_s}{2\pi} \tilde{c}_g G_{\mu\nu}^a \tilde{G}^{\mu\nu,a} \right) H$$

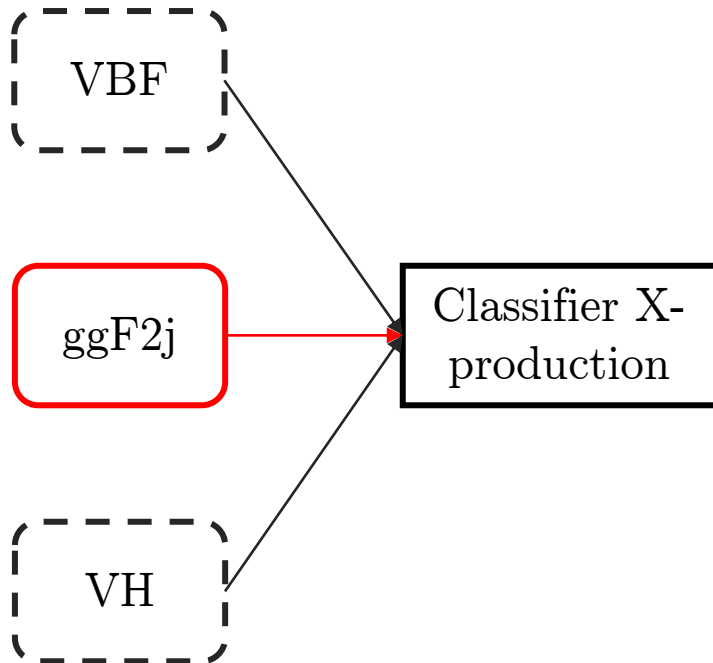

- Effective CP-even ( $c_g$ ) and CP-odd ( $\tilde{c}_g$ ) coupling modifiers
- SM obtained for  $c_g = 1, \tilde{c}_g = 0$
- Higgs-gluon coupling corresponds to top-Yukawa in the heavy top limit and if there are no low-mass BSM particles in the ggF loop  $\Rightarrow c_g = c_t, \tilde{c}_g = \tilde{c}_t$
- We impose a cut  $p_T^H < 200\text{GeV}$  to remain in the heavy top limit

# Analysis strategy

---

$$|\mathcal{M}_{\text{ggF2j}}|^2 = c_g^2 |\mathcal{M}_{\text{even}}|^2 + \underbrace{2c_g \tilde{c}_g \text{Re}[\mathcal{M}_{\text{even}} \mathcal{M}_{\text{odd}}^*]}_{\text{Interference}} + \tilde{c}_g^2 |\mathcal{M}_{\text{odd}}|^2$$

X = ggF2j, VBF

# Analysis strategy

$$|\mathcal{M}_{\text{ggF2j}}|^2 = c_g^2 |\mathcal{M}_{\text{even}}|^2 + \underbrace{2c_g \tilde{c}_g \text{Re}[\mathcal{M}_{\text{even}} \mathcal{M}_{\text{odd}}^*]}_{\text{Interference}} + \tilde{c}_g^2 |\mathcal{M}_{\text{odd}}|^2$$

- Train a CP-even and a CP-odd classifier in a ggF2j-SR and a VBF-SR

# Signal regions

- Use  $P(\text{signal}) > 0.5$  as a cut to define signal regions
- $\text{ggF2j}$  with  $q\bar{q}$  initial state are identified as VBF-like more often
- $\text{ggF2j}$  interference events are also identified as VBF-like more often

# ggF2j signal region

- $P(c_g^2)$  differentiates between  $c_g^2 |\mathcal{M}_{\text{even}}|^2$  and  $\tilde{c}_g^2 |\mathcal{M}_{\text{odd}}|^2$
- Kinematically very similar, but some separation in outer bins
- Interference term cancels out

# ggF2j signal region

Inspired by [Bhardwaj et al. '21](#)

- $P(c_g^2)$  differentiates between  $c_g^2 |\mathcal{M}_{\text{even}}|^2$  and  $\tilde{c}_g^2 |\mathcal{M}_{\text{odd}}|^2$
- Kinematically very similar, but some separation in outer bins
- Interference term cancels out

- $P_+ - P_-$  differentiates between **positive and negative interference**
- Interference barely visible due to low cross section & looks more VBF-like
- CP-even terms are symmetric

# ggF2j signal region

- Ellipse from total rate
- $\Delta\phi_{jj}$  alone is not able to resolve the ellipse
- 2D-limits dominated by the  $P(c_g^2)$  classifier (low interference contribution)

➤  $|\tilde{c}_g| \leq 0.32 @ 1\sigma$

# VBF signal region

- $P(c_g^2)$  differentiates between  $c_g^2 |\mathcal{M}_{\text{even}}|^2$  and  $\tilde{c}_g^2 |\mathcal{M}_{\text{odd}}|^2$
- Less events than in ggF2j-SR, statistical fluctuations visible
- Wider peak around  $P(c_g^2) = 0.5$

# VBF signal region

Inspired by [Bhardwaj et al. '21](#)

- $P(c_g^2)$  differentiates between  $c_g^2 |\mathcal{M}_{\text{even}}|^2$  and  $\tilde{c}_g^2 |\mathcal{M}_{\text{odd}}|^2$
- Less events than in ggF2j-SR, statistical fluctuations visible
- Wider peak around  $P(c_g^2) = 0.5$

- $P_+ - P_-$  differentiates between **positive and negative interference**
- Interference much more pronounced due to overall lower events and their VBF-like kinematic

# VBF signal region

- Ellipse wider due to lower number of events
- Individual classifiers perform worse than  $\Delta\phi_{jj}$  (less information) – large importance of  $\Delta\phi_{jj}$
- 2D-limits are significantly stronger than 1D-limits
- $|\tilde{c}_g| \leq 0.58 @ 1\sigma$

# CP violation in $HVV$ – ggF2j-SR

BSM physics might introduce CP violation in multiple Higgs couplings  
⇒ inject CP violation in VBF production, evaluate effect on  $c_g, \tilde{c}_g$  limits

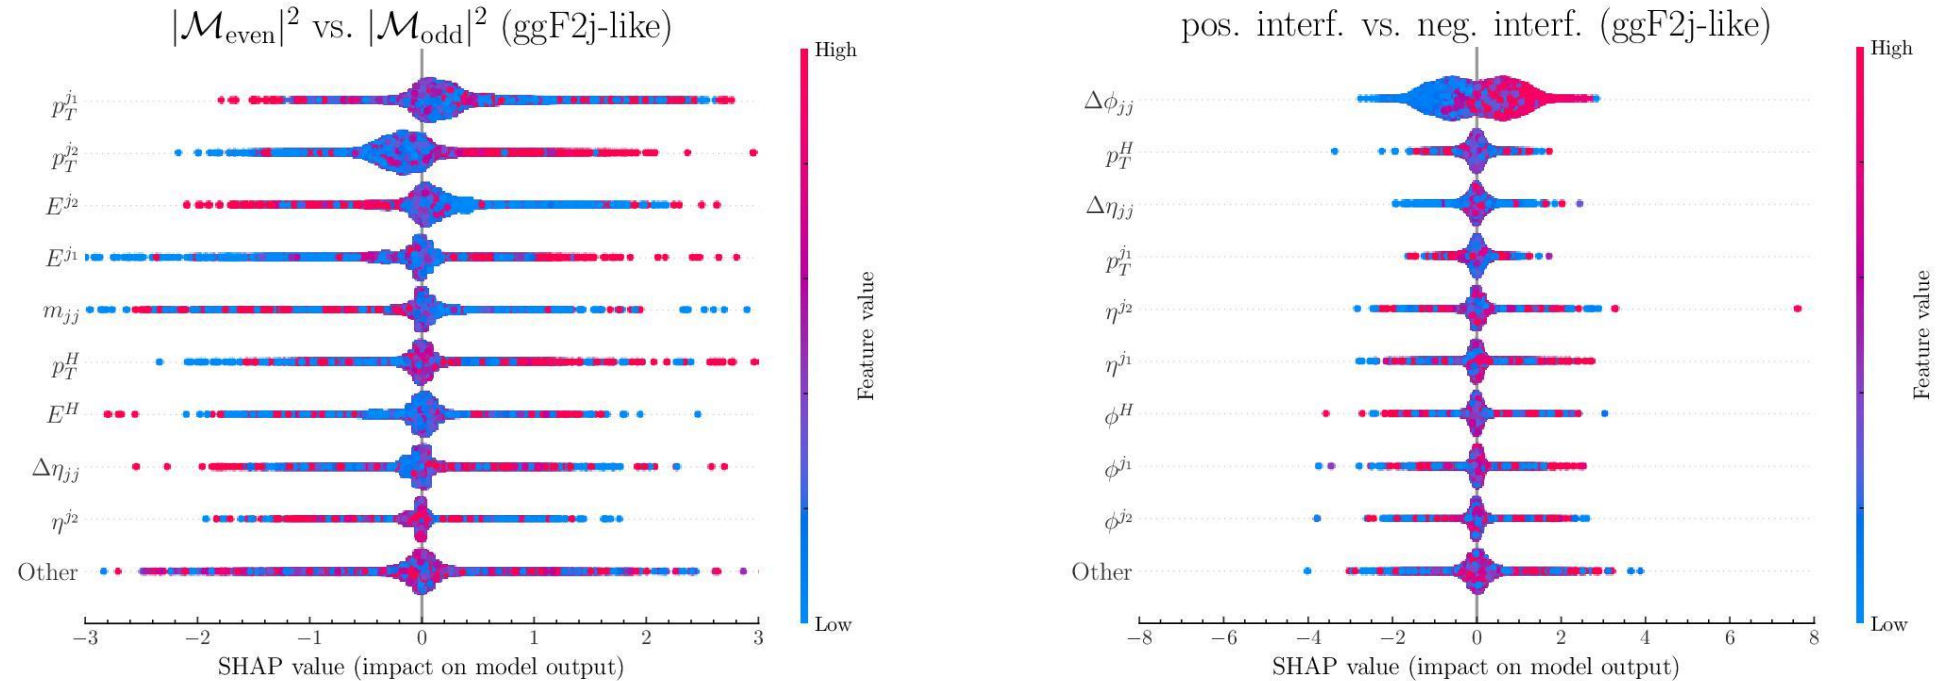

- Limits slightly weaken from  $|\tilde{c}_g| \leq 0.32 @ 1\sigma$  to  $|\tilde{c}_g| \leq 0.37 @ 1\sigma$
- ggF2j-SR provides conservative results for limited knowledge of the  $HVV$  coupling
- Opposite effect in VBF-SR ⇒ fakes much stronger limits on  $\tilde{c}_g$  (see backup)

Adding CP  
Violation in  
VBF

# Feature importance (SHAPLEY) – ggF2j-SR

- No clear „best“ variables for differentiating  $c_g^2 |\mathcal{M}_{\text{even}}|^2$  vs  $\tilde{c}_g^2 |\mathcal{M}_{\text{odd}}|^2$
- $\Delta\phi_{jj}$  is most important for interference classification (CP-odd)
- $\Delta\phi_{jj}$  much less significance than in the VBF-SR (see backup)

# Results & Conclusion

Expected limits on  $|\alpha^{Htt}| = \left| \tan^{-1} \frac{\tilde{c}_t}{c_t} \right|$ :

Process / SR	Our work		Literature		References
	68% CL	95% CL	68% CL	95% CL	
ggF2j (ggF2j-SR)	15°	25°	--	--	
ggF2j (VBF-SR)	25°	--	26°	--	<u>CMS '22</u>
<i>ttH</i>	--	--	35°	43°	<u>ATLAS '20</u>
Global fit	21°	28°	--	--	Update from <u>Bahl et al. '22</u>

- A multivariate analysis in the ggF2j-SR is expected to give strongest limits on  $\alpha^{Htt}$
- The ggF2j-SR is robust against CP violation in *HVV* mimicking CP violation in *ggH*
- **Our findings consolidate the need for a dedicated ggF2j signal region**

Backup

# Backup: Other notations

---

$$\text{Our work: } \mathcal{L}_{ggH} = -\frac{1}{4v} \left( -\frac{\alpha_s}{3\pi} c_g G_{\mu\nu}^a G^{\mu\nu,\alpha} + \frac{\alpha_s}{2\pi} \tilde{c}_g G_{\mu\nu}^a \tilde{G}^{\mu\nu,a} \right) H$$

$$\text{Separate top loop: } \mathcal{L}_{ggH} = -\frac{\alpha_s \pi}{v} \left( c_{gg} G_{\mu\nu}^a G^{\mu\nu,\alpha} + \tilde{c}_{gg} G_{\mu\nu}^a \tilde{G}^{\mu\nu,a} \right) H$$

$$\Rightarrow c_g = 1 + 12\pi^2 c_{gg}, \quad \tilde{c}_g = -8\pi^2 \tilde{c}_{gg}$$

Used in CMS `22

$$\text{SMEFT: } c_g \sim 1 + \sum_i c_i / \Lambda^2 + \dots, \quad \tilde{c}_g \sim \sum_i \tilde{c}_i / \Lambda^2 + \dots$$

$c_i, \tilde{c}_i$ : Wilson coefficients

\* It is possible to relax this cut using  $FT_{\text{approx}}$  → see [Maltoni et al. '14](#)

# CP violation in $HVV$ – VBF-SR

BSM physics might introduce CP violation in multiple Higgs couplings  
⇒ inject CP violation in VBF production, evaluate effect on  $c_g, \tilde{c}_g$  limits

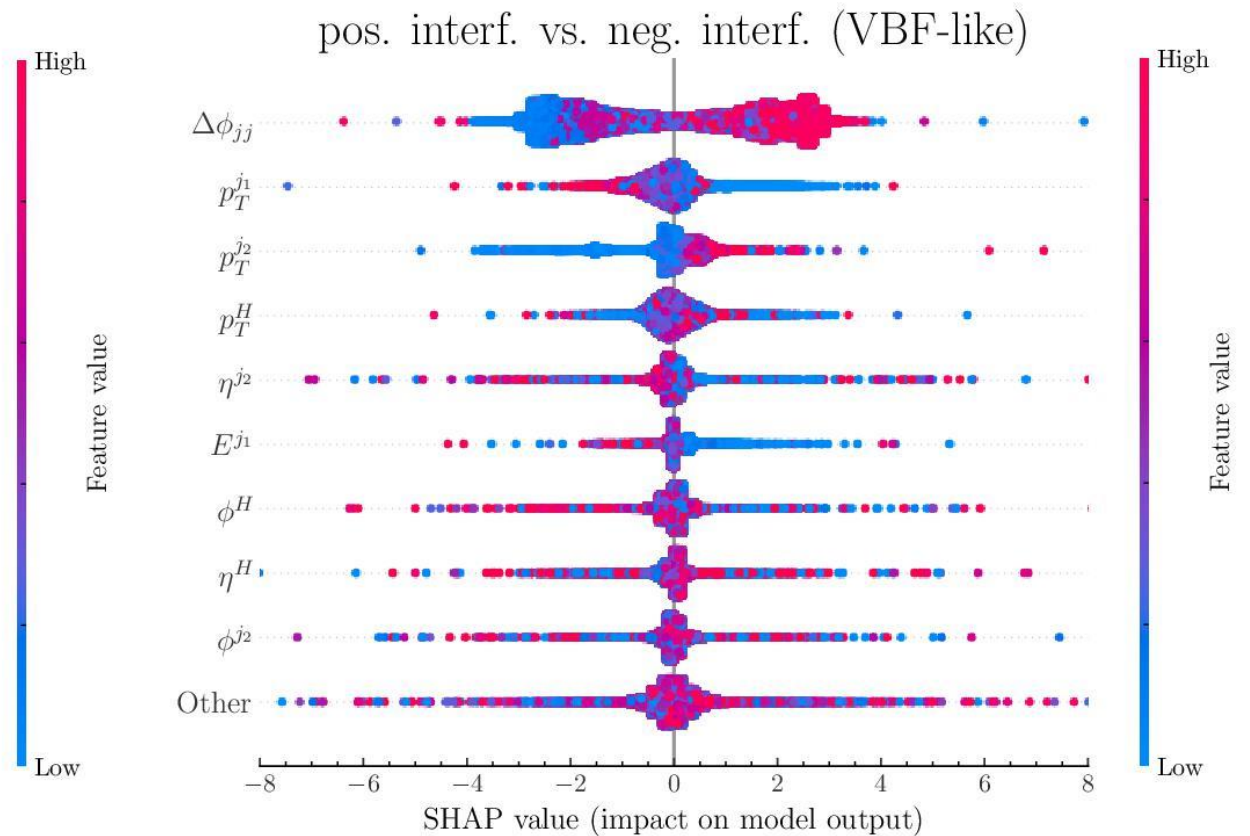

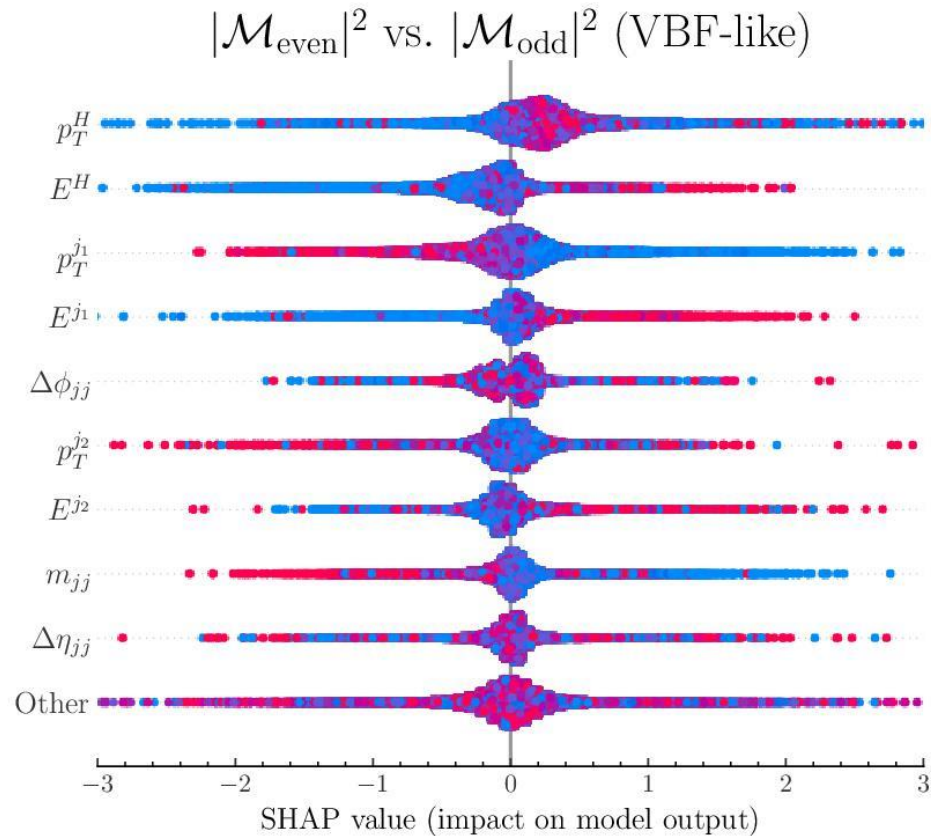

- Limits tighten from  $|\tilde{c}_g| \leq 0.58 @ 1\sigma$  to  $|\tilde{c}_g| \leq 0.48 @ 1\sigma$
- VBF-SR might “fake” stronger limits not originating from CP violation in  $ggH$

Adding CP  
Violation in  
VBF

# Backup: Feature importance – VBF-SR

# Backup: Comparison to global fit

- Interpret  $c_g, \tilde{c}_g$  as top-Yukawa coupling modifiers  $c_t, \tilde{c}_t$  (heavy top limit / strong limits on colored BSM particles)
- Global fit based on experimental results for Higgs signal rates
- Performed with HiggsTools [Bahl et al. `22](#)
- Different form of ellipsis due to recent  $ttH(bb)$  measurements [ATLAS `19](#), [ATLAS `22](#)
- Similar constraints from our analysis
