<sup>3</sup>National Institute of Advanced Industrial Science and Technology (AIST)

PSAS'2024–International Conference on Precision Physics of Simple Atomic Systems

# Groups

Yoshioka group, UTokyo  
–AMO and laser

**Yoshioka group's photo**

Asai group and ICEPP, UTokyo  
–particle physics and positronium  
science

SPF, IMSS, KEK  
–positron diffraction and  
accelerator-based slow positron beam

AIST  
–positron microbeam,  $e^+$  /Ps chemistry,  
and multiple slow positron beams

# Simplest atom in QED: positronium

## Constitution of positronium (Ps)

- Only light leptons
- Weak and QCD effects are small

Precise prediction by  $m_e$  (w/ CPT),  $\alpha$ , and QED  
Textbook system for testing QED and beyond the Standard Model

# Why cold Ps?

Setup of  $1^3S_1 - 2^3S_1$  spectroscopy

Transit-time broadening  $\longleftrightarrow$  40 MHz  $(T / 600 \text{ K})^{0.5}$

2nd-order Doppler  $\longleftrightarrow$  30 MHz  $(T / 600 \text{ K})$

$\Gamma_{\text{nat.}} \approx 1.3 \text{ MHz}$  limited  
Almost by 142 ns lifetime

Much broader than  $\Gamma_{\text{nat.}}$   
by high temperature

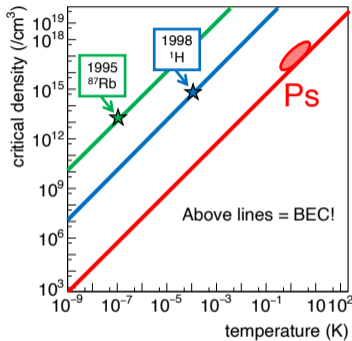

Observed resonance vs some widths

Precision and accuracy in spectroscopy

# Why cold Ps?

**Nobel Prize in 2001**

**BEC phase diagram**

## The production of molecular positronium

D. B. Cassidy<sup>1</sup> & A. P. Mills Jr<sup>1</sup>

### Dense Ps created

PHYSICAL REVIEW A 92, 023820 (2015)

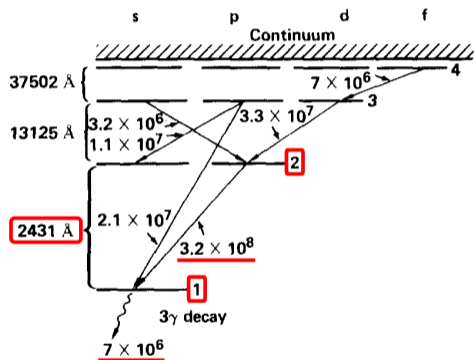

### Gamma-ray laser

First BEC with antimatters and gamma-ray laser

# Proposal of Ps laser cooling

E. P. Liang and C. D. Dermer, Opt. Commun. **65**, 419 (1988)

**ortho-Ps level diagram**

## Cooling efficiency estimation

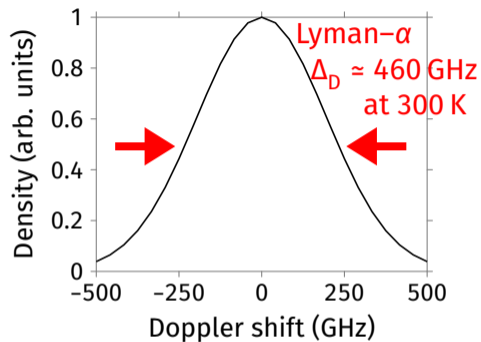

oPs Transitions	$\lambda(\text{\AA})$	$A(\text{s}^{-1})$	$T_{\min}(\text{mK})$	$\Delta t_1(\text{s})$
1s-2p	2431	$3.17 \times 10^8$	21.2	$1.73 \times 10^{-7}$

Laser cooling on Ps should work

# Difficulty in Ps laser cooling

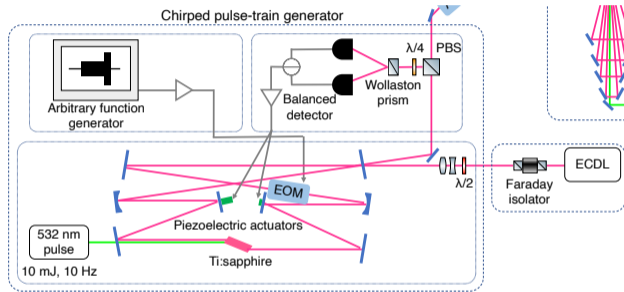

$\approx 100$  ns cooling  $\rightarrow$  long duration laser

$\times 10^{-3}$  smaller mass than H atom  
 $\rightarrow$  broadband laser

# Novel laser for Ps cooling

- K. Yamada *et al.*, Phys. Rev. Appl. **16**, 014009 (2021).
- K. Shu *et al.*, Phys. Rev. A **109**, 043520 (2024).

# How the laser works

Pulse round trip time  $\sim 12$  ns  
Transmittance  $\sim 2\%$

- Long round-trip time
- Small transmittance of the coupler  
→ Long duration

Frequency shifted by each round trip  
→ Broadband

# Measured emission from the cooling laser

**Measured time evolution of power**

Pulse train continues for 300 ns

**Measured time-resolved spectrum**

Sweeps 150 GHz with 0.5 GHz/ns  
Optimal rate aligned with Ps  
deceleration rate: Chirp cooling

# Optimul spectral width of each pulse

Conceptual output

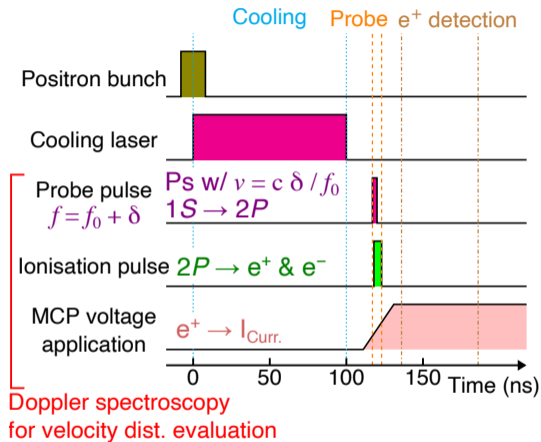

Fine splitting, recoil shift, and spectral width

Cooling and repump from dark for efficient cooling

# 1D chirp cooling experiment

**Experimental setup**

**Timing chart**

arXiv:2310.08761 under review

# Setup photo

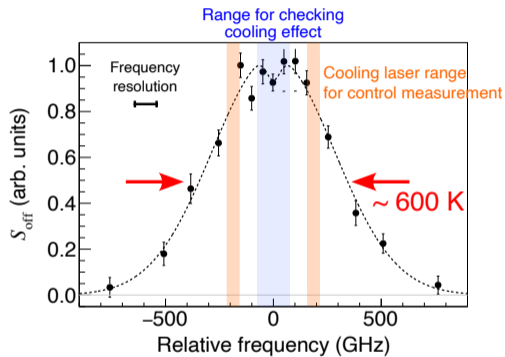

**Beamline and chamber**

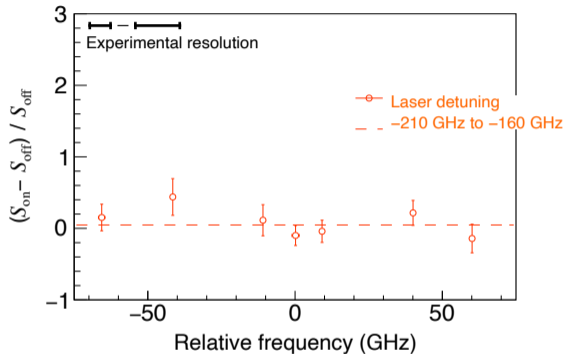

**Top view in the chamber**

# Initial distribution and control measurement

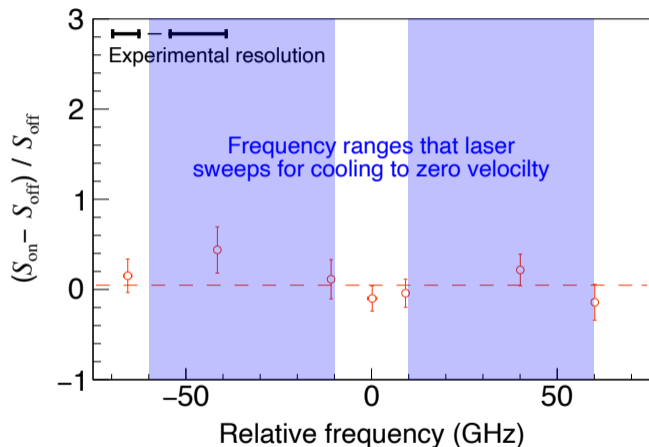

**Doppler profile without cooling laser**

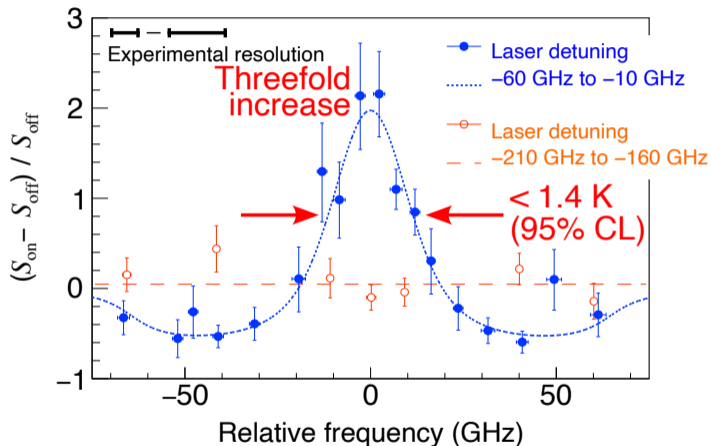

**Normalized difference of Doppler spectrum with cooling laser**

# Observed effect of laser cooling

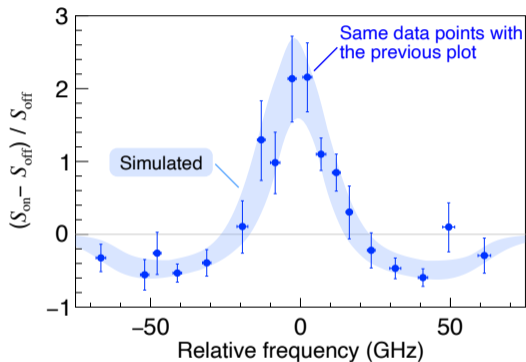

# Observed clear evidence of chirp cooling

# Comparison with optical Bloch equation simulation

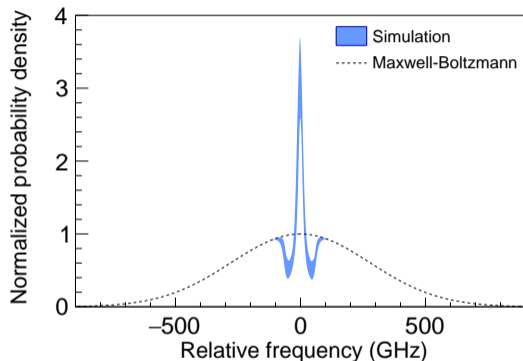

**Comparison to a simulated spectrum with experimental conditions considered**

**Raw simulated Doppler profile**

Narrow peaks may originate from coherent population trapping

# Improvements?

**Reproduced profile for the observed spectrum, obtained from simulations**

## Evaluation of the cooling performance

- Temperature of the cooled:  $\approx 1$  K
- Cooled ratio:  $\approx 10\%$  of the total

## $1^3S_1 - 2^3S_1$ spectroscopy with 1 K Ps

- Transit-time broadening: 1.6 MHz
- 2nd-order Doppler shift: 0.05 MHz

Narrow as  $\Gamma_{\text{nat.}} \approx 1.3$  MHz is expected

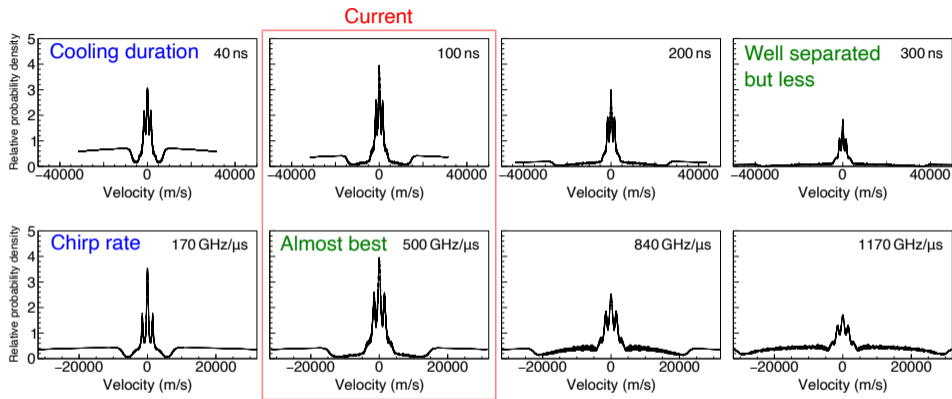

## Straightforward ratio improvement ( $\times 2$ )

Current: 40 nm pore at 300 K  $\rightarrow$  600 K Ps

Better: Cold 5 nm pore  $\rightarrow$  150 K Ps

S. Mariazzi *et al.*, PRL **104**, 243401 (2010)

# Optimization of cooling condition

## Simulated velocity distribution with different laser parameters

Longer cooling time would be better. Study for suppressing side peaks.

# Faster cooling

- Cooling rate is limited by the spontaneous emission rate.
- Use decelerating stimulated emission for de-excitation.
- *c.f.* J. P. Bartolotta *et al.*, Laser Cooling by Sawtooth-Wave Adiabatic Passage, PRA **98**, 023404 (2018).

**Cooling process. J. Malamant *et al.*, arXiv:2402.17052.**

Velocity distribution can be  $\frac{1}{2(=N_{\text{levels}})}$  in 3.2 ns!  
25000 m/s at RT vs 1500 m/s deceleration in  $\approx 3$  ns

# Summary and prospect

## Summary

- First demonstration of 1D chirp cooling of positronium
- Narrow velocity distribution corresponding 1 K was obtained

## Prospects

- Optimized configuration & 3D cooling
- Precision spectroscopy

Another and simultaneous demonstration with different scheme  
*c.f.* L. T. Glöggler *et al.* (AEGIS Collaboration), Phys. Rev. Lett. **132**, 083402 (2024)
