Stephen Lonsdale (PNU)

Introduction

Motivation

Two stories of axion dark matter

A proposal for new experiment for axion DM

The magnetic vortex

Axion electrodynamics

Axion magnetic vortex

Conclusion

Axion as a window to BSM

- ▶ There are many candidates for dark matter.
- ▶ Axion is still one of the prime candidates for dark matter.
- ▶ It is theoretically well motivated as a solution to the strong CP problem.
- ▶ Currently several experiments to detect axions are going on and new ones are being proposed.

Axion as a window to BSM

- ▶ Axion is still one of the prime candidates for dark matter.
- ▶ It is theoretically well motivated as a solution to the strong CP problem.
- ▶ Currently several experiments to detect axions are going on and new ones are being proposed.

Axion as a window to BSM

- ▶ There are many candidates for dark matter.
- ▶ Axion is still one of the prime candidates for dark matter.
- ▶ It is theoretically well motivated as a solution to the strong CP problem.
- ▶ Currently several experiments to detect axions are going on and new ones are being proposed.

Axion as a window to BSM

- ▶ There are many candidates for dark matter.
- ▶ Axion is still one of the prime candidates for dark matter.
- ▶ It is theoretically well motivated as a solution to the strong CP problem.
- ▶ Currently several experiments to detect axions are going on and new ones are being proposed.

Axion as Dark matter

- ▶ The axion solves the strong CP problem dynamically.

- ▶ For $T \ll f$ and $H \ll m_a$, the axions are homogeneous and behave collectively as CDM (Preskill+Wiseman+Wilczek, Abbott+Sikivie, Dine+Fischler 1983):

$$a(t) = \frac{\sqrt{2\rho_a}}{m_a} \sin(m_a t)$$

Axion as Dark matter

- ▶ The axion solves the strong CP problem dynamically.

- ▶ For $T \ll f$ and $H \ll m_a$, the axions are homogeneous and behave collectively as CDM (Preskill+Wiseman+Wilczek, Abbott+Sikivie, Dine+Fischler 1983):

$$a(t) = \frac{\sqrt{2\rho_a}}{m_a} \sin(m_a t)$$

Axion as Dark matter

- ▶ For a large decay constant, axions are weakly coupled to SM particles and may constitute DM, $\rho_a \approx \rho_{\text{DM}}$. (Turner 1986)

$$\Omega_a h^2 \approx 0.23 \times 10^{\pm 0.6} \left(\frac{f}{10^{12} \text{ GeV}} \right)^{1.175} \theta_i^2 F(\theta_i),$$

Two stories of axion DM (LACME and Axion Vortex)

- ▶ A proposal to detect axions (See talk by S.H. Im on Wed.) :

- ▶ Axion vortex ($m = g_{a\gamma}\dot{a}$) (See talk by S. Lonsdale on Thurs.)

Existing experiments and proposals

- ▶ From its coupling to photons: (Sikivie '83, ... CAPP)

$$\mathcal{L}_{\text{int}} \ni g_{a\gamma\gamma} \frac{a}{2f} \epsilon^{\mu\nu\rho\sigma} F_{\mu\nu} F_{\rho\sigma} .$$

Existing experiments and proposals

- ▶ Axions couple to photons, modifying Maxwell equations:
ABRACADABRA '16, DMRadio, ...

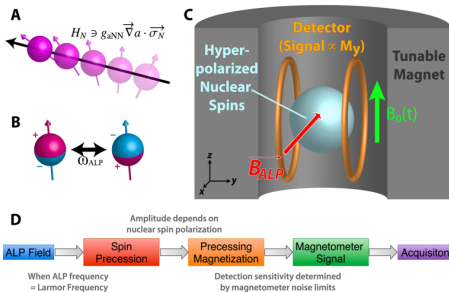

$$\nabla \times \vec{B} = g_{a\gamma\gamma} \dot{a} \vec{B}.$$

Existing experiments and proposals

- ▶ Axions couple to gluons and hadrons: CASPER, spin torsion, ...

$$\mathcal{L}_{\text{int}} \ni \frac{c_N}{f} \partial_\mu a \bar{N} \gamma^\mu \gamma_5 N + i \frac{g_d}{2} a(t) \bar{N} \sigma_{\mu\nu} \gamma_5 N F^{\mu\nu}$$

Low temperature Axion Chiral Magnetic Effect

- ▶ Electrons couple to axion DM: LACME (our proposal)

$$\mathcal{L}_{\text{int}} = C_e \frac{\partial_\mu a}{f} \bar{\psi} \gamma^\mu \gamma_5 \psi \approx \frac{C_e}{f} \sqrt{2\rho_{\text{DM}}} \cos(m_a t) \psi^\dagger \gamma_5 \psi.$$

- ▶ Axion DM acts as an axial chemical potential for electrons.

$$\mu_5 = C_e \frac{\sqrt{2\rho_{\text{DM}}}}{f} \cos(m_a t)$$

- ▶ The axial chemical potential induces a helicity imbalance if $B \neq 0$. \Rightarrow Chiral Magnetic Effects (Fukushima+Kharzeev+Warringa 2008).

Low temperature Axion Chiral Magnetic Effect

- ▶ Electrons couple to axion DM: LACME (our proposal)

$$\mathcal{L}_{\text{int}} = C_e \frac{\partial_\mu a}{f} \bar{\psi} \gamma^\mu \gamma_5 \psi \approx \frac{C_e}{f} \sqrt{2\rho_{\text{DM}}} \cos(m_a t) \psi^\dagger \gamma_5 \psi.$$

- ▶ Axion DM acts as an axial chemical potential for electrons.

$$\mu_5 = C_e \frac{\sqrt{2\rho_{\text{DM}}}}{f} \cos(m_a t)$$

- ▶ The axial chemical potential induces a helicity imbalance if $B \neq 0$. \Rightarrow Chiral Magnetic Effects (Fukushima+Kharzeev+Warringa 2008).

Low temperature Axion Chiral Magnetic Effect

- ▶ Electrons couple to axion DM: LACME (our proposal)

$$\mathcal{L}_{\text{int}} = C_e \frac{\partial \mu a}{f} \bar{\psi} \gamma^\mu \gamma_5 \psi \approx \frac{C_e}{f} \sqrt{2\rho_{\text{DM}}} \cos(m_a t) \psi^\dagger \gamma_5 \psi.$$

- ▶ Axion DM acts as an axial chemical potential for electrons.

$$\mu_5 = C_e \frac{\sqrt{2\rho_{\text{DM}}}}{f} \cos(m_a t)$$

- ▶ The axial chemical potential induces a helicity imbalance if $B \neq 0$. \Rightarrow Chiral Magnetic Effects (Fukushima+Kharzeev+Warringa 2008).

Axionic Chiral Magnetic Effects

- ▶ The axial chemical potential adds a kick to electrons along their spin direction:

$$\mathcal{L} = \bar{\Psi} (i\not{\partial} - m + \mu\gamma^0 + \mu_5\gamma^0\gamma_5) \Psi$$

- ▶ We take a non-relativistic limit by subtracting out the rest mass and integrating out the negative states, χ :

$$\Psi \equiv \begin{pmatrix} \psi \\ \chi \end{pmatrix} e^{-imt} \quad (\mu_{\text{NR}} \equiv \mu - m)$$

$$\Rightarrow \mathcal{L}_{\text{NR}} = \psi^\dagger \left[i\partial_0 - \frac{(i\vec{\sigma} \cdot \vec{\nabla} + \mu_5)^2}{2m} \right] \psi + \mu_{\text{NR}} \psi^\dagger \psi + \dots$$

Axionic Chiral Magnetic Effects

- ▶ The axial chemical potential adds a kick to electrons along their spin direction:

$$\mathcal{L} = \bar{\Psi} (i\not{\partial} - m + \mu\gamma^0 + \mu_5\gamma^0\gamma_5) \Psi$$

- ▶ We take a non-relativistic limit by subtracting out the rest mass and integrating out the negative states, χ :

$$\Psi \equiv \begin{pmatrix} \psi \\ \chi \end{pmatrix} e^{-imt} \quad (\mu_{\text{NR}} \equiv \mu - m)$$

$$\Rightarrow \mathcal{L}_{\text{NR}} = \psi^\dagger \left[i\partial_0 - \frac{(i\vec{\sigma} \cdot \vec{\nabla} + \mu_5)^2}{2m} \right] \psi + \mu_{\text{NR}} \psi^\dagger \psi + \dots$$

Normal medium

- ▶ Consider a cold medium of (free) electrons :

$$\mathcal{L} = \bar{\psi} (i\cancel{\partial} - m + \mu\gamma^0) \psi$$

⇓

$$E = -\mu \pm \sqrt{m^2 + \vec{p}^2},$$

Figure: normal medium

chiral magnetic effects in chiral medium

- ▶ CME is a **current flow** due to the helicity imbalance in (**polarized**) medium by the axial chemical potential μ_5 and B :

$$\langle \vec{j} \rangle = v_F \frac{e^2}{2\pi^2} \mu_5 \vec{B}$$

Figure: chiral medium

- ▶ We need **polarized electrons** to see this effect.
- ▶ Under an external magnetic field, electrons move parallel or antiparallel to \vec{B} but the spins are always antiparallel for LLL.

chiral magnetic effects in chiral medium

- ▶ CME is a **current flow** due to the helicity imbalance in (**polarized**) medium by the axial chemical potential μ_5 and B :

$$\langle \vec{j} \rangle = v_F \frac{e^2}{2\pi^2} \mu_5 \vec{B}$$

Axionic Chiral Magnetic Effects

- ▶ We propose a new experiment (LACME) to detect this non-dissipative currents in a conductor:

$$j^3 = 6.8 \times 10^{-15} \text{Am}^{-2} \left(\frac{v_F}{0.01c} \right) \left(\frac{\rho_{\text{DM}}}{0.4 \text{ GeVcm}^{-3}} \right)^{1/2} \left(\frac{10^{12} \text{ GeV}}{f/C_e} \right) \left(\frac{B}{10 \text{ Tesla}} \right)$$

Axionic Chiral Magnetic Effects

- ▶ Projection of LACME from existing axion haloscopes, assuming $v_F = 0.01$ ($g_{ae} = 2C_e m_e / f$):

Axion-electron coupling

- ▶ The axion-electron coupling depends on the UV model.
- ▶ The strength of the axion-electron coupling varies as (See e.g. 2106.05816 by Choi+Im+Seong)

$$C_e \simeq \begin{cases} \mathcal{O}(1) & \text{DFSZ-like models} \\ \mathcal{O}(10^{-4} \sim 10^{-3}) & \text{KSVZ-like models} \\ \mathcal{O}(10^{-3} \sim 10^{-2}) & \text{String-theoretic axions.} \end{cases}$$

- ▶ The precise measurement of the axion-electron coupling can uncover its microscopic origin.

Axion-electron coupling

- ▶ The axion-electron coupling depends on the UV model.
- ▶ The strength of the axion-electron coupling varies as (See e.g. 2106.05816 by Choi+Im+Seong)

$$C_e \simeq \begin{cases} \mathcal{O}(1) & \text{DFSZ-like models} \\ \mathcal{O}(10^{-4} \sim 10^{-3}) & \text{KSVZ-like models} \\ \mathcal{O}(10^{-3} \sim 10^{-2}) & \text{String-theoretic axions.} \end{cases}$$

- ▶ The precise measurement of the axion-electron coupling can uncover its microscopic origin.

Axion-electron coupling

- ▶ The axion-electron coupling depends on the UV model.

$$C_e \simeq \begin{cases} \mathcal{O}(1) & \text{DFSZ-like models} \\ \mathcal{O}(10^{-4} \sim 10^{-3}) & \text{KSVZ-like models} \\ \mathcal{O}(10^{-3} \sim 10^{-2}) & \text{String-theoretic axions.} \end{cases}$$

- ▶ The precise measurement of the axion-electron coupling can uncover its microscopic origin.

Axion electrodynamics

- ▶ Axion electrodynamics for $\vec{\nabla}a = 0$:

$$\vec{\nabla} \cdot \vec{E} = 0, \quad \vec{\nabla} \times \vec{B} - \frac{\partial}{\partial t} \vec{E} = -g_{a\gamma} \dot{a} \vec{B},$$

- ▶ In axion electrodynamics, the magnetic field sources itself, producing a current $\vec{J} = -m\vec{B}$ with $m = g_{a\gamma}\dot{a}$ even in the absence of charged particles.
- ▶ **Magnetic fields are self-coupled.** Superposition of magnetic fields is not possible.

Axion electrodynamics

- ▶ Axion electrodynamics for $\vec{\nabla}a = 0$:

$$\vec{\nabla} \cdot \vec{E} = 0, \quad \vec{\nabla} \times \vec{B} - \frac{\partial}{\partial t} \vec{E} = -g_{a\gamma} \dot{a} \vec{B},$$

- ▶ In axion electrodynamics, the magnetic field sources itself, producing a current $\vec{J} = -m\vec{B}$ with $m = g_{a\gamma} \dot{a}$ even in the absence of charged particles.
- ▶ Magnetic fields are self-coupled. Superposition of magnetic fields is not possible.

Axion electrodynamics

- ▶ Axion electrodynamics for $\vec{\nabla}a = 0$:

$$\vec{\nabla} \cdot \vec{E} = 0, \quad \vec{\nabla} \times \vec{B} - \frac{\partial}{\partial t} \vec{E} = -g_{a\gamma} \dot{a} \vec{B},$$

- ▶ In axion electrodynamics, the magnetic field sources itself, producing a current $\vec{J} = -m\vec{B}$ with $m = g_{a\gamma} \dot{a}$ even in the absence of charged particles.
- ▶ **Magnetic fields are self-coupled.** Superposition of magnetic fields is not possible.

Axion electrodynamics

- ▶ When \dot{a} is almost constant, there should exist a topological soliton carrying a finite magnetic flux.
- ▶ We therefore ask how the magnetic fields along the vortex should be distributed to minimize its energy for a given magnetic flux, which is topologically conserved.
- ▶ Our ansatz :

$$\vec{E} = 0, \quad \vec{B} = (0, B_\varphi(\rho), B_z(\rho)) ,$$

Axion electrodynamics

- ▶ When \dot{a} is almost constant, there should exist a topological soliton carrying a finite magnetic flux.
- ▶ We therefore ask how the magnetic fields along the vortex should be distributed to minimize its energy for a given magnetic flux, which is topologically conserved.
- ▶ Our ansatz :

$$\vec{E} = 0, \quad \vec{B} = (0, B_\varphi(\rho), B_z(\rho)) ,$$

Axion electrodynamics

- ▶ When \dot{a} is almost constant, there should exist a topological soliton carrying a finite magnetic flux.
- ▶ We therefore ask how the magnetic fields along the vortex should be distributed to minimize its energy for a given magnetic flux, which is topologically conserved.
- ▶ Our ansatz :

$$\vec{E} = 0, \quad \vec{B} = (0, B_\varphi(\rho), B_z(\rho)) ,$$

Axion electrodynamics

- ▶ The energy for the static magnetic field

$$\mathcal{E} = \int d^3x \left\{ \frac{1}{2} \vec{B}^2 - \vec{A} \cdot \vec{J} \right\} = \int d^3x \left\{ \frac{1}{2} (\vec{B} + m\vec{A})^2 - \frac{1}{2} m^2 \vec{A}^2 \right\}$$

- ▶ The minimum energy saturated by configurations that satisfy the Maxwell equation or $\vec{B} = -m\vec{A}$ in the Coulomb gauge:

$$B_\varphi'' + \frac{1}{\rho} B_\varphi' - \left(\frac{1}{\rho^2} - m^2 \right) B_\varphi = 0; \quad B_z'' + \frac{1}{\rho} B_z' + m^2 B_z = 0.$$

Axion electrodynamics

- ▶ The energy for the static magnetic field

$$\mathcal{E} = \int d^3x \left\{ \frac{1}{2} \vec{B}^2 - \vec{A} \cdot \vec{J} \right\} = \int d^3x \left\{ \frac{1}{2} (\vec{B} + m\vec{A})^2 - \frac{1}{2} m^2 \vec{A}^2 \right\}$$

- ▶ The minimum energy saturated by configurations that satisfy the Maxwell equation or $\vec{B} = -m\vec{A}$ in the Coulomb gauge:

$$B''_{\varphi} + \frac{1}{\rho} B'_{\varphi} - \left(\frac{1}{\rho^2} - m^2 \right) B_{\varphi} = 0; \quad B''_z + \frac{1}{\rho} B'_z + m^2 B_z = 0.$$

Axion magnetic vortex

- ▶ The minimum energy configuration for a given flux Φ is with the normalization, $\mathcal{N} = 2\pi \int_0^{x_c} x J_0(x) dx$,

$$B_\varphi(\rho) = -m|m| \frac{\Phi}{\mathcal{N}} J_1(|m|\rho), \quad B_z(\rho) = m^2 \frac{\Phi}{\mathcal{N}} J_0(|m|\rho).$$

Axion magnetic vortex

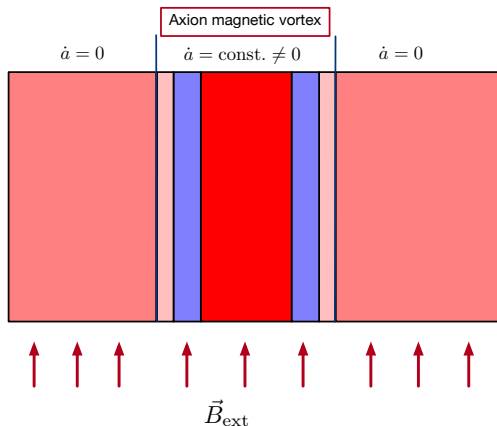

- ▶ The minimum energy configuration for a given flux Φ is with the normalization, $\mathcal{N} = 2\pi \int_0^{x_c} x J_0(x) dx$,

$$B_\varphi(\rho) = -m|m| \frac{\Phi}{\mathcal{N}} J_1(|m|\rho), \quad B_z(\rho) = m^2 \frac{\Phi}{\mathcal{N}} J_0(|m|\rho).$$

Axion magnetic vortex

- ▶ If we apply an external magnetic field, \vec{B}_{ext} , an axion magnetic vortex will form spontaneously:

Axion magnetic vortex

- ▶ For the normal modes inside axion magnetic vortex

$$\delta a = \theta(t)f(|m|\rho)$$

- ▶ The normal modes satisfy, after rescaling $|m|\rho$ to be ρ ,

$$-\nabla^2 f(\rho) - \frac{\omega^2}{m^2} H(\rho) f(\rho) = -\lambda f(\rho),$$

where $\omega^2 = -\ddot{\theta}/\theta$, $\lambda = m_a^2/m^2$, $H = 1 - g_{a\gamma}^2 m|m| \left(\frac{\Phi}{N} J_0(\rho)\right)^2$.

Axion magnetic vortex

- ▶ For the normal modes inside axion magnetic vortex

$$\delta a = \theta(t) f(|m|\rho)$$

- ▶ The normal modes satisfy, after rescaling $|m|\rho$ to be ρ ,

$$-\nabla^2 f(\rho) - \frac{\omega^2}{m^2} H(\rho) f(\rho) = -\lambda f(\rho),$$

where $\omega^2 = -\ddot{\theta}/\theta$, $\lambda = m_a^2/m^2$, $H = 1 - g_{a\gamma}^2 m|m| \left(\frac{\Phi}{\mathcal{N}} J_0(\rho)\right)^2$.

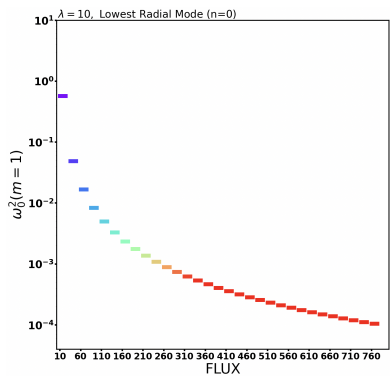

Axion magnetic vortex

- ▶ Axion spectrum inside vortex is that of Schrödinger equation:

Axion magnetic vortex

- ▶ The lowest energy eigenstate :

Axion magnetic vortex

- ▶ The soliton is stable because $\omega^2 < 0$ has no normalizable solution.
- ▶ Inside the vortex, axions are bound, having energy smaller than m_a for $m < 0$.

Axion magnetic vortex

- ▶ The soliton is stable because $\omega^2 < 0$ has no normalizable solution.
- ▶ Inside the vortex, axions are bound, having energy smaller than m_a for $m < 0$.

Conclusion

- ▶ We show that dark matter axions or axion-like particles (ALP) induce non-dissipative alternating electric currents in conductors along the external magnetic fields due to the axial anomaly, realizing the chiral magnetic effects.

$$\vec{j} = v_F \frac{e^2}{2\pi^2} \frac{C_e}{f} \dot{a}\vec{B}. \quad (\text{LACME}).$$

- ▶ We propose a new experiment to measure this current in medium to detect the dark matter axions or ALP. (LACME)
- ▶ This non-dissipative currents are the electron medium effects, directly proportional to the axion or ALP coupling to electrons, which depends on their microscopic physics.

Conclusion

- ▶ We show that dark matter axions or axion-like particles (ALP) induce non-dissipative alternating electric currents in conductors along the external magnetic fields due to the axial anomaly, realizing the chiral magnetic effects.

$$\vec{j} = v_F \frac{e^2}{2\pi^2} \frac{C_e}{f} \dot{a}\vec{B}. \quad (\text{LACME}).$$

Conclusion

- ▶ We show that dark matter axions or axion-like particles (ALP) induce non-dissipative alternating electric currents in conductors along the external magnetic fields due to the axial anomaly, realizing the chiral magnetic effects.

$$\vec{j} = v_F \frac{e^2}{2\pi^2} \frac{C_e}{f} \dot{a}\vec{B}. \quad (\text{LACME}).$$

- ▶ We propose a new experiment to measure this current in medium to detect the dark matter axions or ALP. (LACME)
- ▶ This non-dissipative currents are **the electron medium effects**, directly proportional to **the axion or ALP coupling to electrons**, which depends on their microscopic physics.

Conclusion

- ▶ If \dot{a} is constant, there should exist a vortex solution of minimum energy for a give magnetic flux.
- ▶ The axion magnetic vortex is stable for small fluctuations.
- ▶ Axions are bound to the vortex, having energy $\omega < m_a$.
- ▶ Astrophysical signatures of the axion vortex are under investigations.

Conclusion

- ▶ If \dot{a} is constant, there should exist a vortex solution of minimum energy for a give magnetic flux.
- ▶ The axion magnetic vortex is stable for small fluctuations.
- ▶ Axions are bound to the vortex, having energy $\omega < m_a$.
- ▶ Astrophysical signatures of the axion vortex are under investigations.

Conclusion

- ▶ If \dot{a} is constant, there should exist a vortex solution of minimum energy for a give magnetic flux.
- ▶ The axion magnetic vortex is stable for small fluctuations.
- ▶ Axions are bound to the vortex, having energy $\omega < m_a$.
