

MD10703: Ions BB limit varying the crossing angles

G. Sterbini, R. Bruce, S. Kostoglou, M. Hostettler

MD10703: Ions BB limit varying the crossing angles →

8 h (not including the validation time)

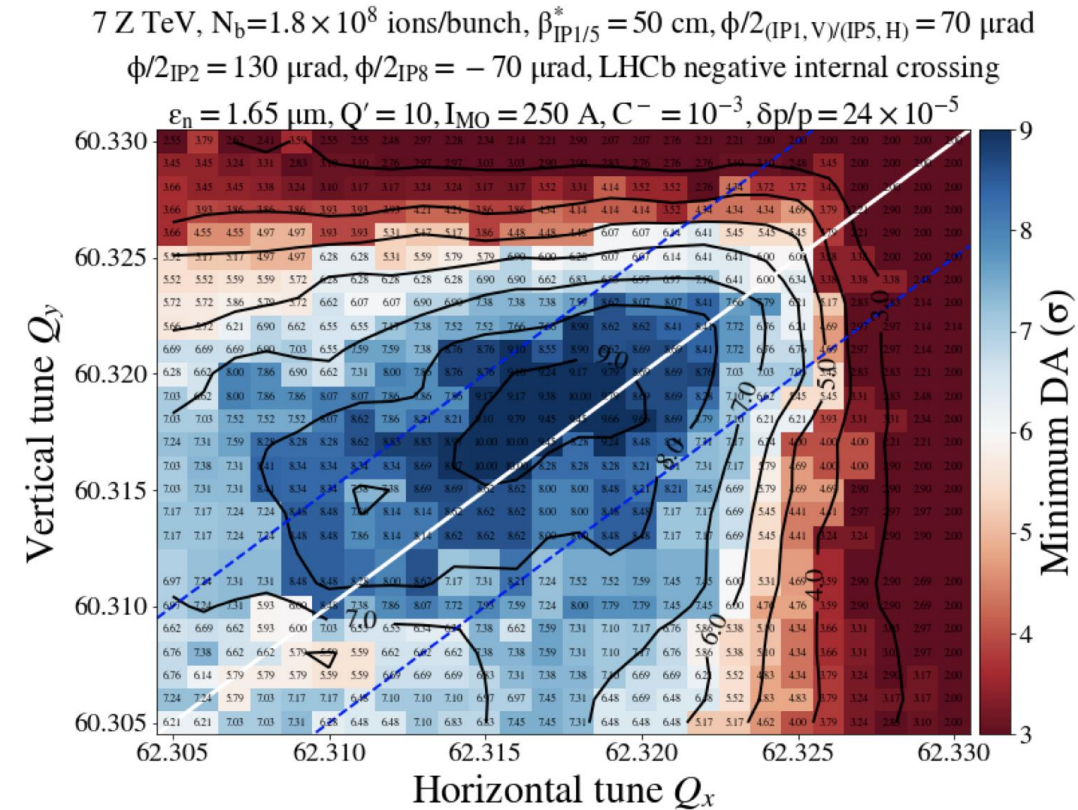

As for protons, there is an interest in reduce the crossing angle of the ions (in IP1/2/5/8). Simulations show significant margin if we adopt the proton metric (DA>6 sigma) but the DA/MD benchmarking with ions is limited. More on <https://indico.cern.ch/event/1078695>.

MD benefits:

1. Potential performance gain (θ_x and β^* reduction)
2. Simulation benchmarking for ions studies

We request a 8 h (+2 h for validation if needed) MD to make one θ_x -scan in IP1/2/5/8 with $\beta^*=50/50/50/150$ cm

Ions DA simulations with reduced θ_x

Filling scheme proposal

- 5 x 8b per batch, 4 batches per beam, 320b in total (detail [here](#)).
- Bunches with nominal parameters (emittance/intensity).

MD steps (I)

From [LMC 471](#), machine nominal IP configurations is

	IP1	IP2	IP5	IP8
β^* (m)	0.5	0.5	0.5	1.5
crossing plane	V	V	H	H
spectrometer half crossing (μrad)	0	∓ 72	0	-139
external half crossing (μrad)	170	± 170	170	-135
net half crossing (μrad)	170	± 98	170	-274
spectrometer polarity	-	pos/neg	-	pos

- STEP 1: Go to collisions with a fully nominal configuration.
- STEP 2: Once in collisions, optimized and in a stable situation, load (discrete) limits for the TCTs that are open to allow crossing angle reductions.
- STEP 3: We reduce with 5/10 urad steps the IP1/5, IP2 and IP8 crossing angles using the orchestration tools (tested during the night of 21-22 Sept, [F9177](#)). If losses occurs \rightarrow optimize the tunes
 - The target is to explore down to 50-70 urad external crossing angle

This implies to potentially reaching down to ~ 200 urad in IP8 (could potentially go significantly lower), 70 urad in IP1/5 and even towards 0 in IP2. If we observe parasitic collisions before detrimental effects from beam-beam, it is also an important input.

MD steps (II)

Step 3 will be iterated 5-7 times.

As main online observable we consider the bbb lifetime. Offline analysis will consider also effective cross-section (using bbb lumiinosity, FBCT or dBLM).

If very detrimental effects are observed on the beam, stop the scan.

- STEP 4: End the cycle with an emittance scan.
- STEP 5: Dump.

Thank you for your attention.
