## One-loop power spectrum in ultra slow-roll inflation and implications for primordial black hole dark matter

Wednesday, 15 May 2024 11:47 (5 minutes)

A possible way to generate primordial black holes as candidates for the entirety of dark matter is a large power spectrum of inflationary curvature fluctuations. Recently, questions have been raised regarding the validity of perturbation theory in this context. We compute the one-loop power spectrum in ultra-slow roll inflation, including all relevant interactions for such analysis, along with counterterms that absorb the ultraviolet divergences. We compare the one-loop and tree-level contributions to the power spectrum, finding that perturbation theory remains valid in realistic ultra-slow roll models.

## Would you be interested in presenting a poster? (this will not impact the decision on your talk)

yes

**Primary authors:** BALLESTEROS, Guillermo (IFT UAM-CSIC); GAMBIN EGEA, Jesus (Instituto de Fisica Teorica, UAM - CSIC)

Presenter: GAMBIN EGEA, Jesus (Instituto de Fisica Teorica, UAM - CSIC)

Session Classification: Early Universe
