

Charm physics at Belle & Belle II

*Cristina Martellini,
on behalf of the Belle & Belle II collaborations*

Cristina Martellini, 23.10.2024

35th Rencontres de Blois, Particle Physics and Cosmology, Blois 20-24 October 2024

Experiments

✓ Belle (1999-2010) & Belle II(2018-current) operate at asymmetric e^+e^- colliders

- ▶ Collisions at or near $\Upsilon(4S)$: $\sqrt{s} = 10.58$ GeV
- ▶ Belle @ KEKB (1999-2010) : $\mathcal{L}_{peak} = 2 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$, $\mathcal{L}_{int} = 1 \text{ ab}^{-1}$
- ▶ Belle II @ SuperKEKB (2019-current) : $\mathcal{L}_{peak} = 4 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$, $\mathcal{L}_{int} = 0.42 \text{ ab}^{-1}$

✓ Belle & Belle II are now **synergic** experiments

- ▶ Belle data can be analysed with the **Belle II analysis software**
 - Analysis can be performed with a combination of Belle and Belle II data
 - Important for charm analysis, where large statistics is crucial to improve the precision

- Well-known **initial state** condition & **clean environment**
- Efficient reconstruction of **neutrals**
- Boosted center of mass that allows for time-dependent measurements
- Hermetic detectors with excellent PID and tracking performance

BELLE @ KEKB

Belle II @ SuperKEKB

Charm physics at a B factory

- Primarily a B factory, but **not only!**

Per ab^{-1} (events $\times 10^9$): 1.1 $B\bar{B}$, 1.3 $c\bar{c}$, 2.1 $q\bar{q}$, 0.9 $\tau^+\tau^-$

- Two possible production mechanisms

- One or more charmed hadrons produced in B mesons decays : $e^+e^- \rightarrow \Upsilon(4S) \rightarrow B\bar{B} \rightarrow X_c$
- Two charmed hadrons produced from continuum, along with fragmentation particles : $e^+e^- \rightarrow c\bar{c} \rightarrow X_c$

$$e^+e^- \rightarrow c\bar{c} \rightarrow D_{\text{tag}}X_{\text{frag}}D_{\text{sig}}$$

- Typically only reconstruct the signal channel
- Also provides access to **charmed baryons**
- No entanglement between two charmed hadrons, inaccessible strong phase

Highlights

Measurement of time-integrated CP asymmetry in $D^0 \rightarrow K_S^0 K_S^0$ decays

Search for CPV in $D_{(S)}^+ \rightarrow K_S^0 K^- \pi^+ \pi^+$ decays

Model-Independent measurement of $D^0 - \bar{D}^0$ mixing parameter in $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays

Measurements of the branching fractions of $\Xi_c^0 \rightarrow \Xi^0 \pi^0$, $\Xi_c^0 \rightarrow \Xi^0 \eta$, $\Xi_c^0 \rightarrow \Xi^0 \eta'$ and asymmetry parameter of $\Xi_c^0 \rightarrow \Xi^0 \pi^0$

CPV in T-odd observables

Two approaches

$$A_{raw} = \frac{\Gamma(D \rightarrow f) - \Gamma(\bar{D} \rightarrow \bar{f})}{\Gamma(D \rightarrow f) + \Gamma(\bar{D} \rightarrow \bar{f})}$$

$$A_{raw} = A_{CP} + A_{FB} + A_{\epsilon}$$

- Obtain asymmetry from difference in partial widths
- A_{raw} includes asymmetries in production and reconstruction
 - A_{FB} : arising from $\gamma - Z^0$ interference
 - A_{ϵ} : reconstruction of final-state particles
 - need a control channel
- in charm: singly-Cabibbo suppressed two-body decays

$$a_{CP} \propto \sin(\phi)\sin(\delta)$$

$$A_T = \frac{\Gamma(C_{TP} > 0) - \Gamma(C_{TP} < 0)}{\Gamma(C_{TP} > 0) + \Gamma(C_{TP} < 0)} \quad \bar{A}_T = \frac{\Gamma(-\bar{C}_{TP} > 0) - \Gamma(-\bar{C}_{TP} < 0)}{\Gamma(-\bar{C}_{TP} > 0) + \Gamma(-\bar{C}_{TP} < 0)}$$

$$a_{CP} = \frac{1}{2}(A_T - \bar{A}_T)$$

- Measure asymmetry in kinematic observable (e.g triple-product C_{TP})
- $A_T \neq 0$ can also arise from final-state interaction
 - isolate CP violation with a_{CP}
 - a_{CP} is unaffected by production and reconstruction asymmetries
- in charm: four-body decay channels

$$a_{CP} \propto \sin(\phi)\cos(\delta)$$

- Using combined datasets from Belle and Belle II

→ $D^0 \rightarrow K_S^0 K_S^0$ is a singly Cabibbo suppressed (SCS) decay, which involves the interference of $c \rightarrow us\bar{s}$ and $c \rightarrow udd\bar{d}$ amplitudes

- We introduce a background rejection variable

$$S_{min}(K_S^0) = \log[\min(L_1/\sigma_{L_1}, L_2/\sigma_{L_2})]$$

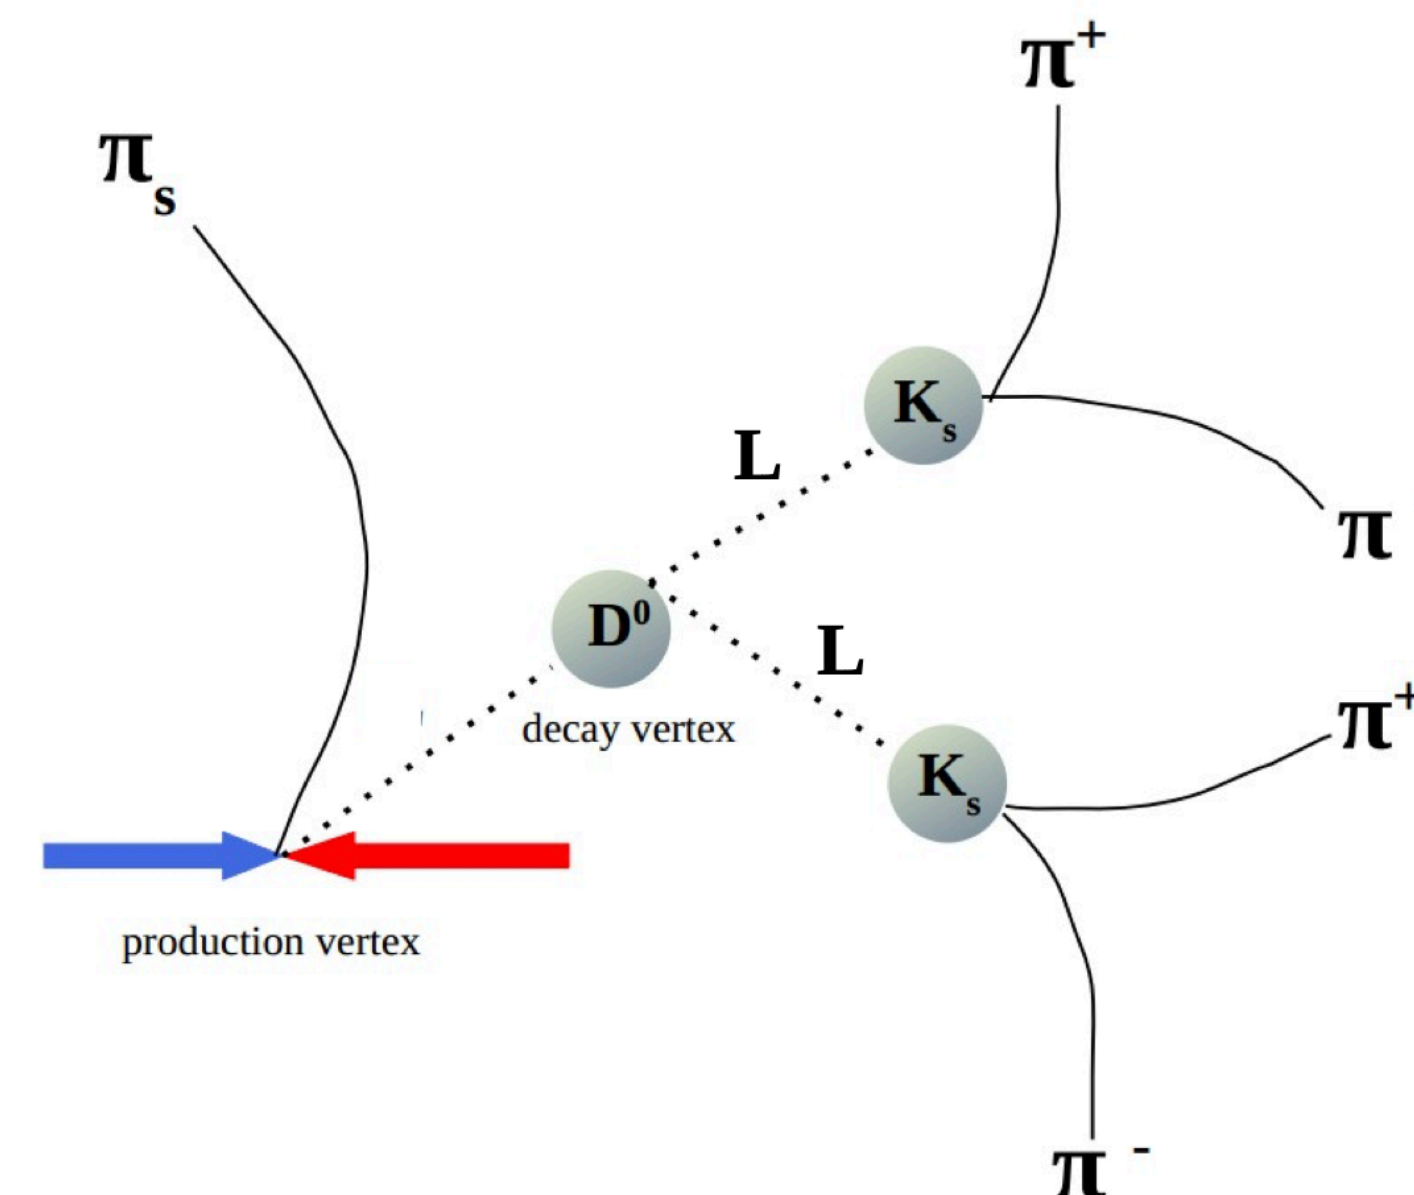

- CP asymmetry, A_{CP} , may be enhanced to be an observable level within the standard model

- The **world average** determination of $A_{CP}(D^0 \rightarrow K_S^0 K_S^0)$: $(-1.9 \pm 1.0) \%$

is limited by statistical

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = \frac{\Gamma(D^0 \rightarrow K_S^0 K_S^0) - \Gamma(\bar{D}^0 \rightarrow K_S^0 K_S^0)}{\Gamma(D^0 \rightarrow K_S^0 K_S^0) + \Gamma(\bar{D}^0 \rightarrow K_S^0 K_S^0)}$$

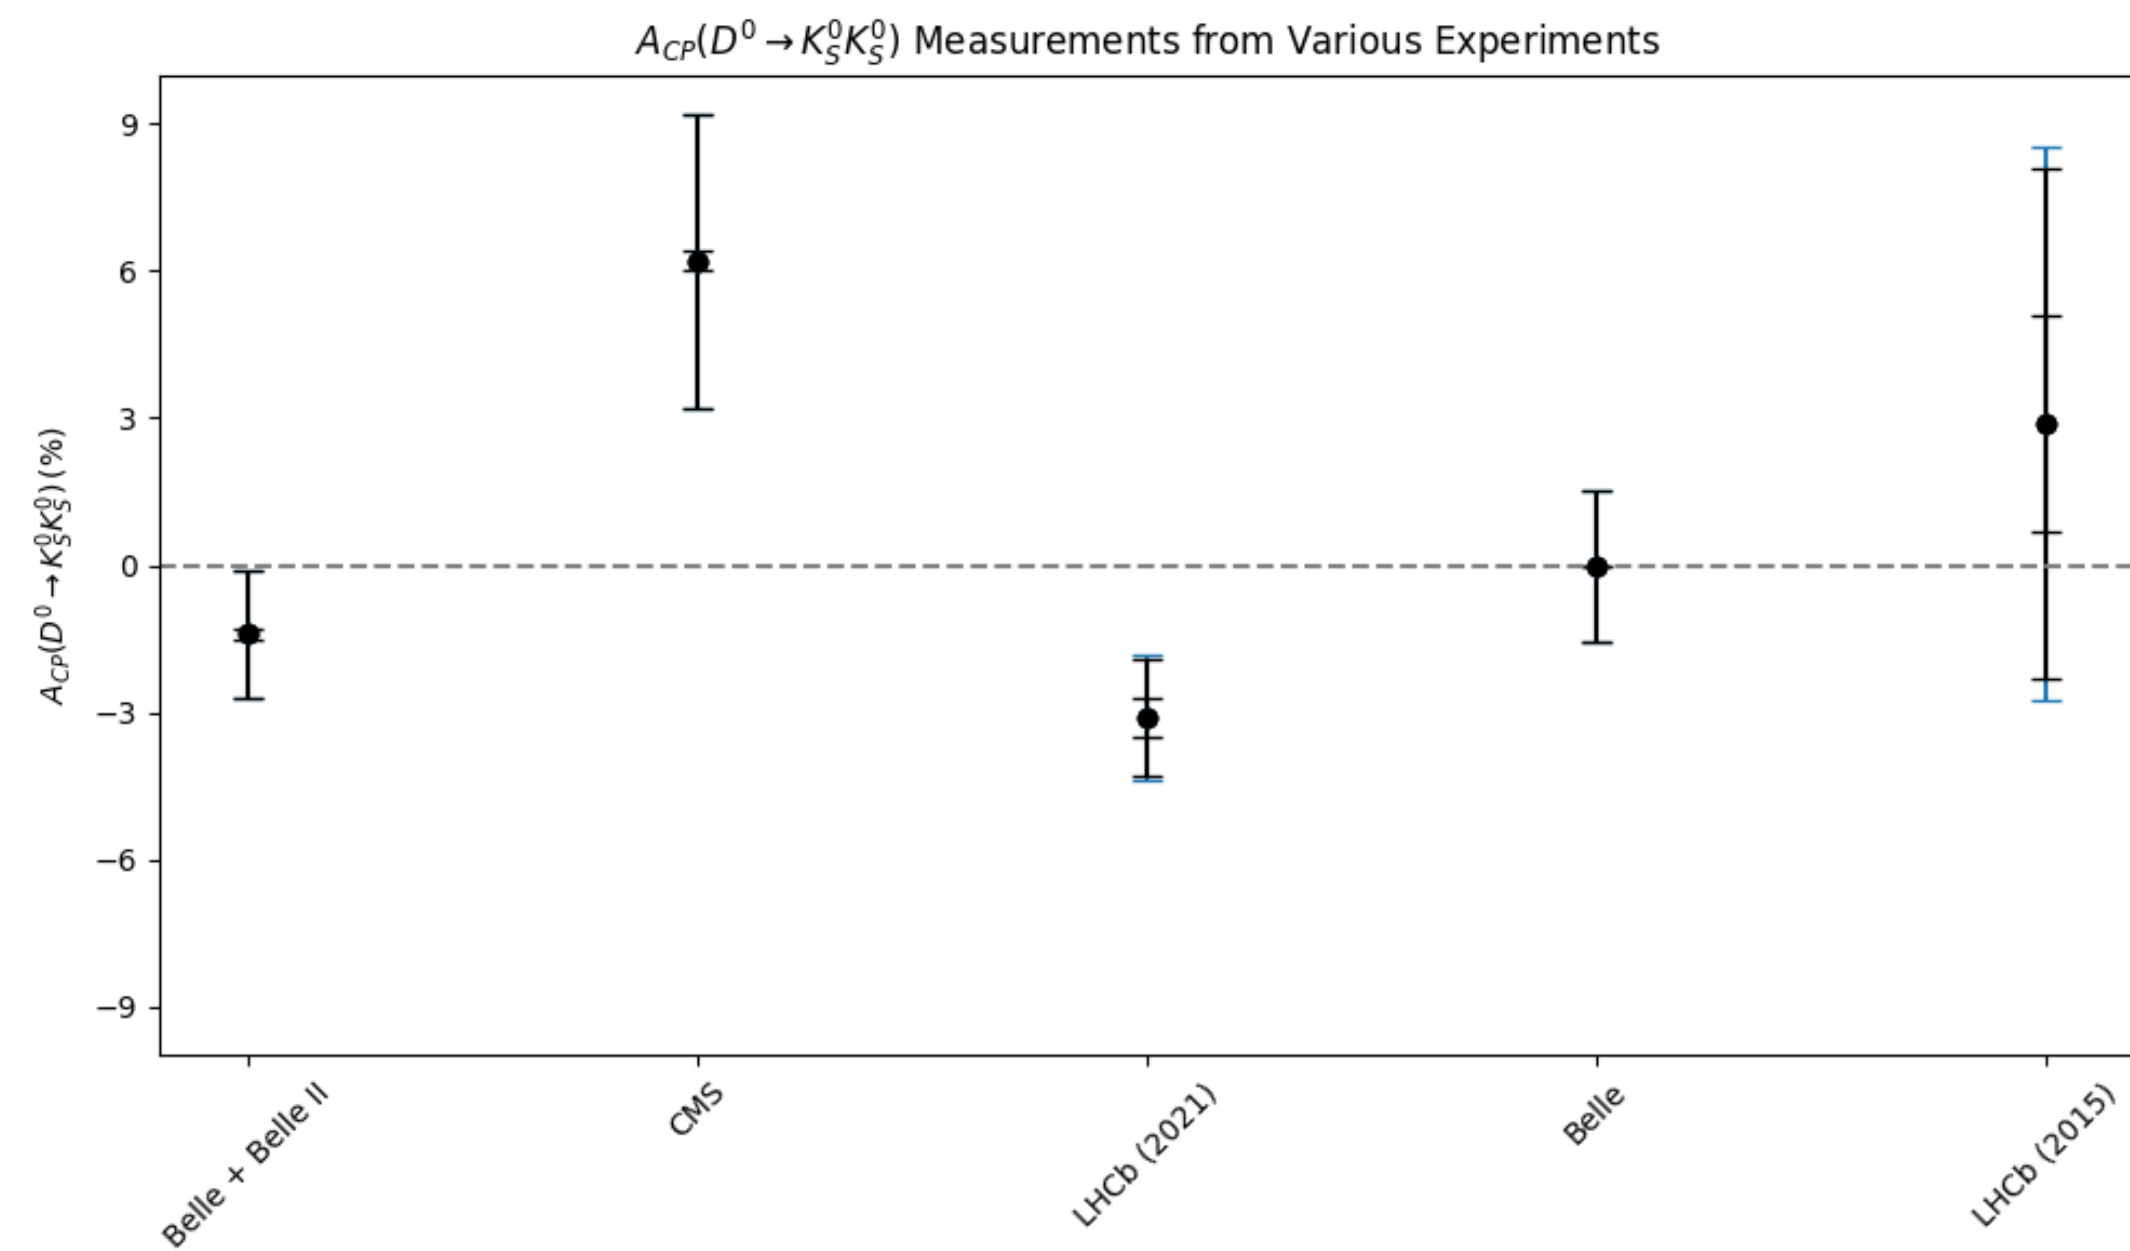

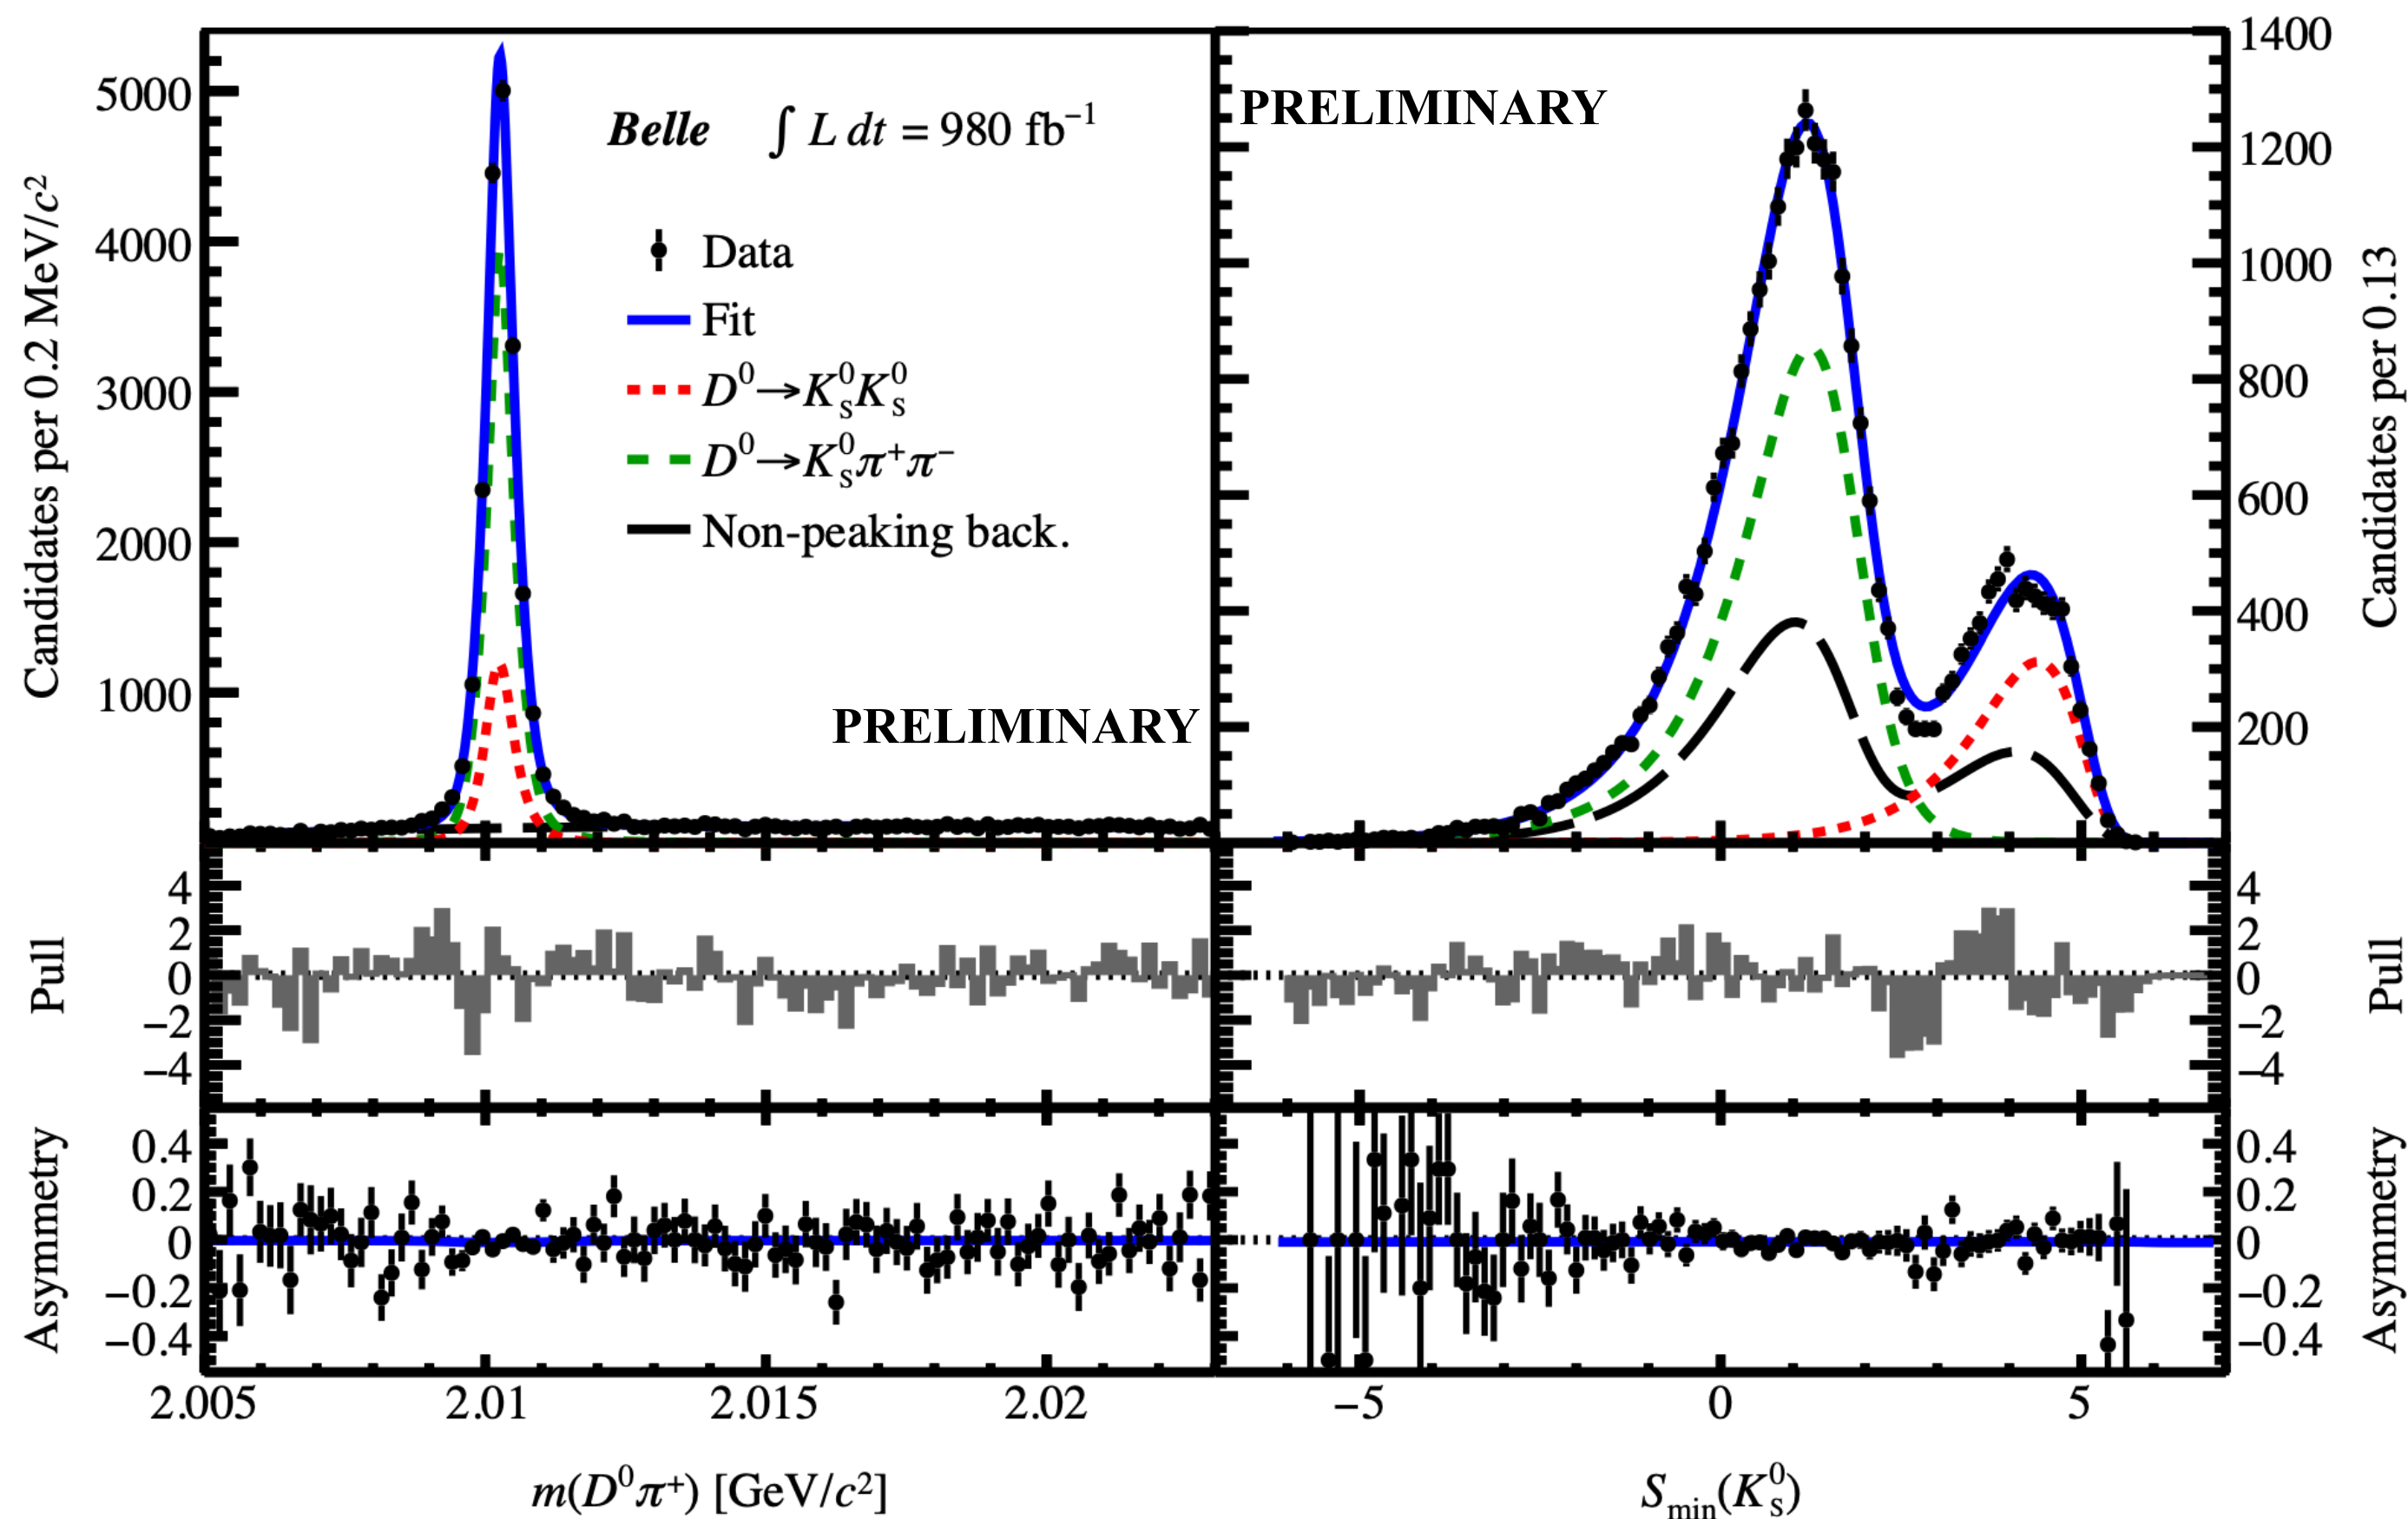

- The flight distance of the K_S^0 (with respect to the D^0 vertex) is exploited to provide separation of the peaking background ($D^0 \rightarrow K_S^0 \pi^+ \pi^-$) from the signal

Time-integrated CP asymmetry in $D^0 \rightarrow K_S^0 K_S^0$

Preliminary,
paper in preparation

- Using combined datasets from Belle and Belle II
- Fit to $m(D^0 \pi^+)$ and $S(K_S^0)$ to extract signal yield and raw asymmetry
- $D^0 \rightarrow K^+ K^-$ used as a **control sample**

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (-1.1 \pm 1.6 \pm 0.1) \% \quad \text{Belle}$$

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (-2.2 \pm 2.3 \pm 0.1) \% \quad \text{Belle II}$$

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (-1.4 \pm 1.3 \pm 0.1) \% \quad \text{Belle + Belle II}$$

Belle

Belle II

Belle + Belle II

CPV in $D_{(s)}^+ \rightarrow K_S^0 K^- \pi^+ \pi^+$

Most precise measurements

$$C_{TP} = (\vec{p}_{K^-} \times \vec{p}_{\pi_h^+}) \cdot \vec{p}_{K_S^0}$$

- better mass resolution and background suppression at Belle II

▸ Thanks to improved detector design/performance and additional pixel detector

→ Procedure to extract the asymmetry

- Suppress background using D decay length significance, vertex fit quality
- Divide candidates in 4 categories and parametrise signal yields as a function of $N(D^\pm)$, A_T , a_{CP}^{T-odd}
- Systematic effects related to efficiency variation of C_{TP}
- Results are among world's most precise measurements, no evidence of CPV

$$N(D_{(s)}^+, C_{TP} > 0) = \frac{N_+}{2}(1 + A_T)$$

$$N(D_{(s)}^+, C_{TP} < 0) = \frac{N_+}{2}(1 - A_T)$$

$$N(D_{(s)}^-, \bar{C}_{TP} > 0) = \frac{N_-}{2}(1 + A_T - 2a_{CP})$$

$$N(D_{(s)}^-, \bar{C}_{TP} < 0) = \frac{N_-}{2}(1 - A_T + 2a_{CP})$$

$$D^+ : a_{CP} = (-0.23 \pm 0.45(\text{stat}) \pm 0.15(\text{syst})) \%$$

$$D_s^+ : a_{CP} = (-0.02 \pm 0.24(\text{stat}) \pm 0.08(\text{syst})) \%$$

→ Procedure to extract the asymmetry

- Asymmetries also measured in additional kinematic observables
- Quadrupole product, helicity angle distributions
- 12 results in total for the two decay-mode

In charm: four-body decays

$$C_{QP} = (\vec{p}_{K^-} \times \vec{p}_{\pi_h^+}) \cdot \vec{p}_{K_S^0} \times \vec{p}_{\pi_l^+}$$

Charm mixing in $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays

Preliminary,
paper in preparation

Using combined datasets from Belle and Belle II

Model-independent measurement of $D^0 - \bar{D}^0$ mixing parameters (SCS)

Mixing parameters:

$$x = \frac{m_1 - m_2}{\Gamma} \quad y = \frac{\Gamma_1 - \Gamma_2}{2\Gamma}$$

Mass of the $D_{1(2)}$ state

Width of the $D_{1(2)}$ state

$$|D_{1,2}\rangle = p |D^0\rangle \pm q |\bar{D}^0\rangle$$

$$CP |D^0\rangle = + |\bar{D}^0\rangle$$

World average values : $x = (4.07 \pm 0.44) \times 10^{-3}$

$y = (6.47 \pm 0.24) \times 10^{-3}$

Using combined set from Belle (951 fb^{-1}) and Belle II (408 fb^{-1}) : $D^{*+} \rightarrow D^0(\rightarrow K_S^0 \pi^+ \pi^-) \pi^+$

Signal and background are separated using fits to the two-dimensional distribution of D^0 mass : $M(K_S^0 \pi^+ \pi^-)$ and energy released in the D^{*+} : Q

Charm mixing in $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays

Preliminary,
paper in preparation

- Using combined datasets from Belle and Belle II

Result of the (M,Q) fit to the data integrated over the Dalitz-plot bins to the Belle II and Belle data samples

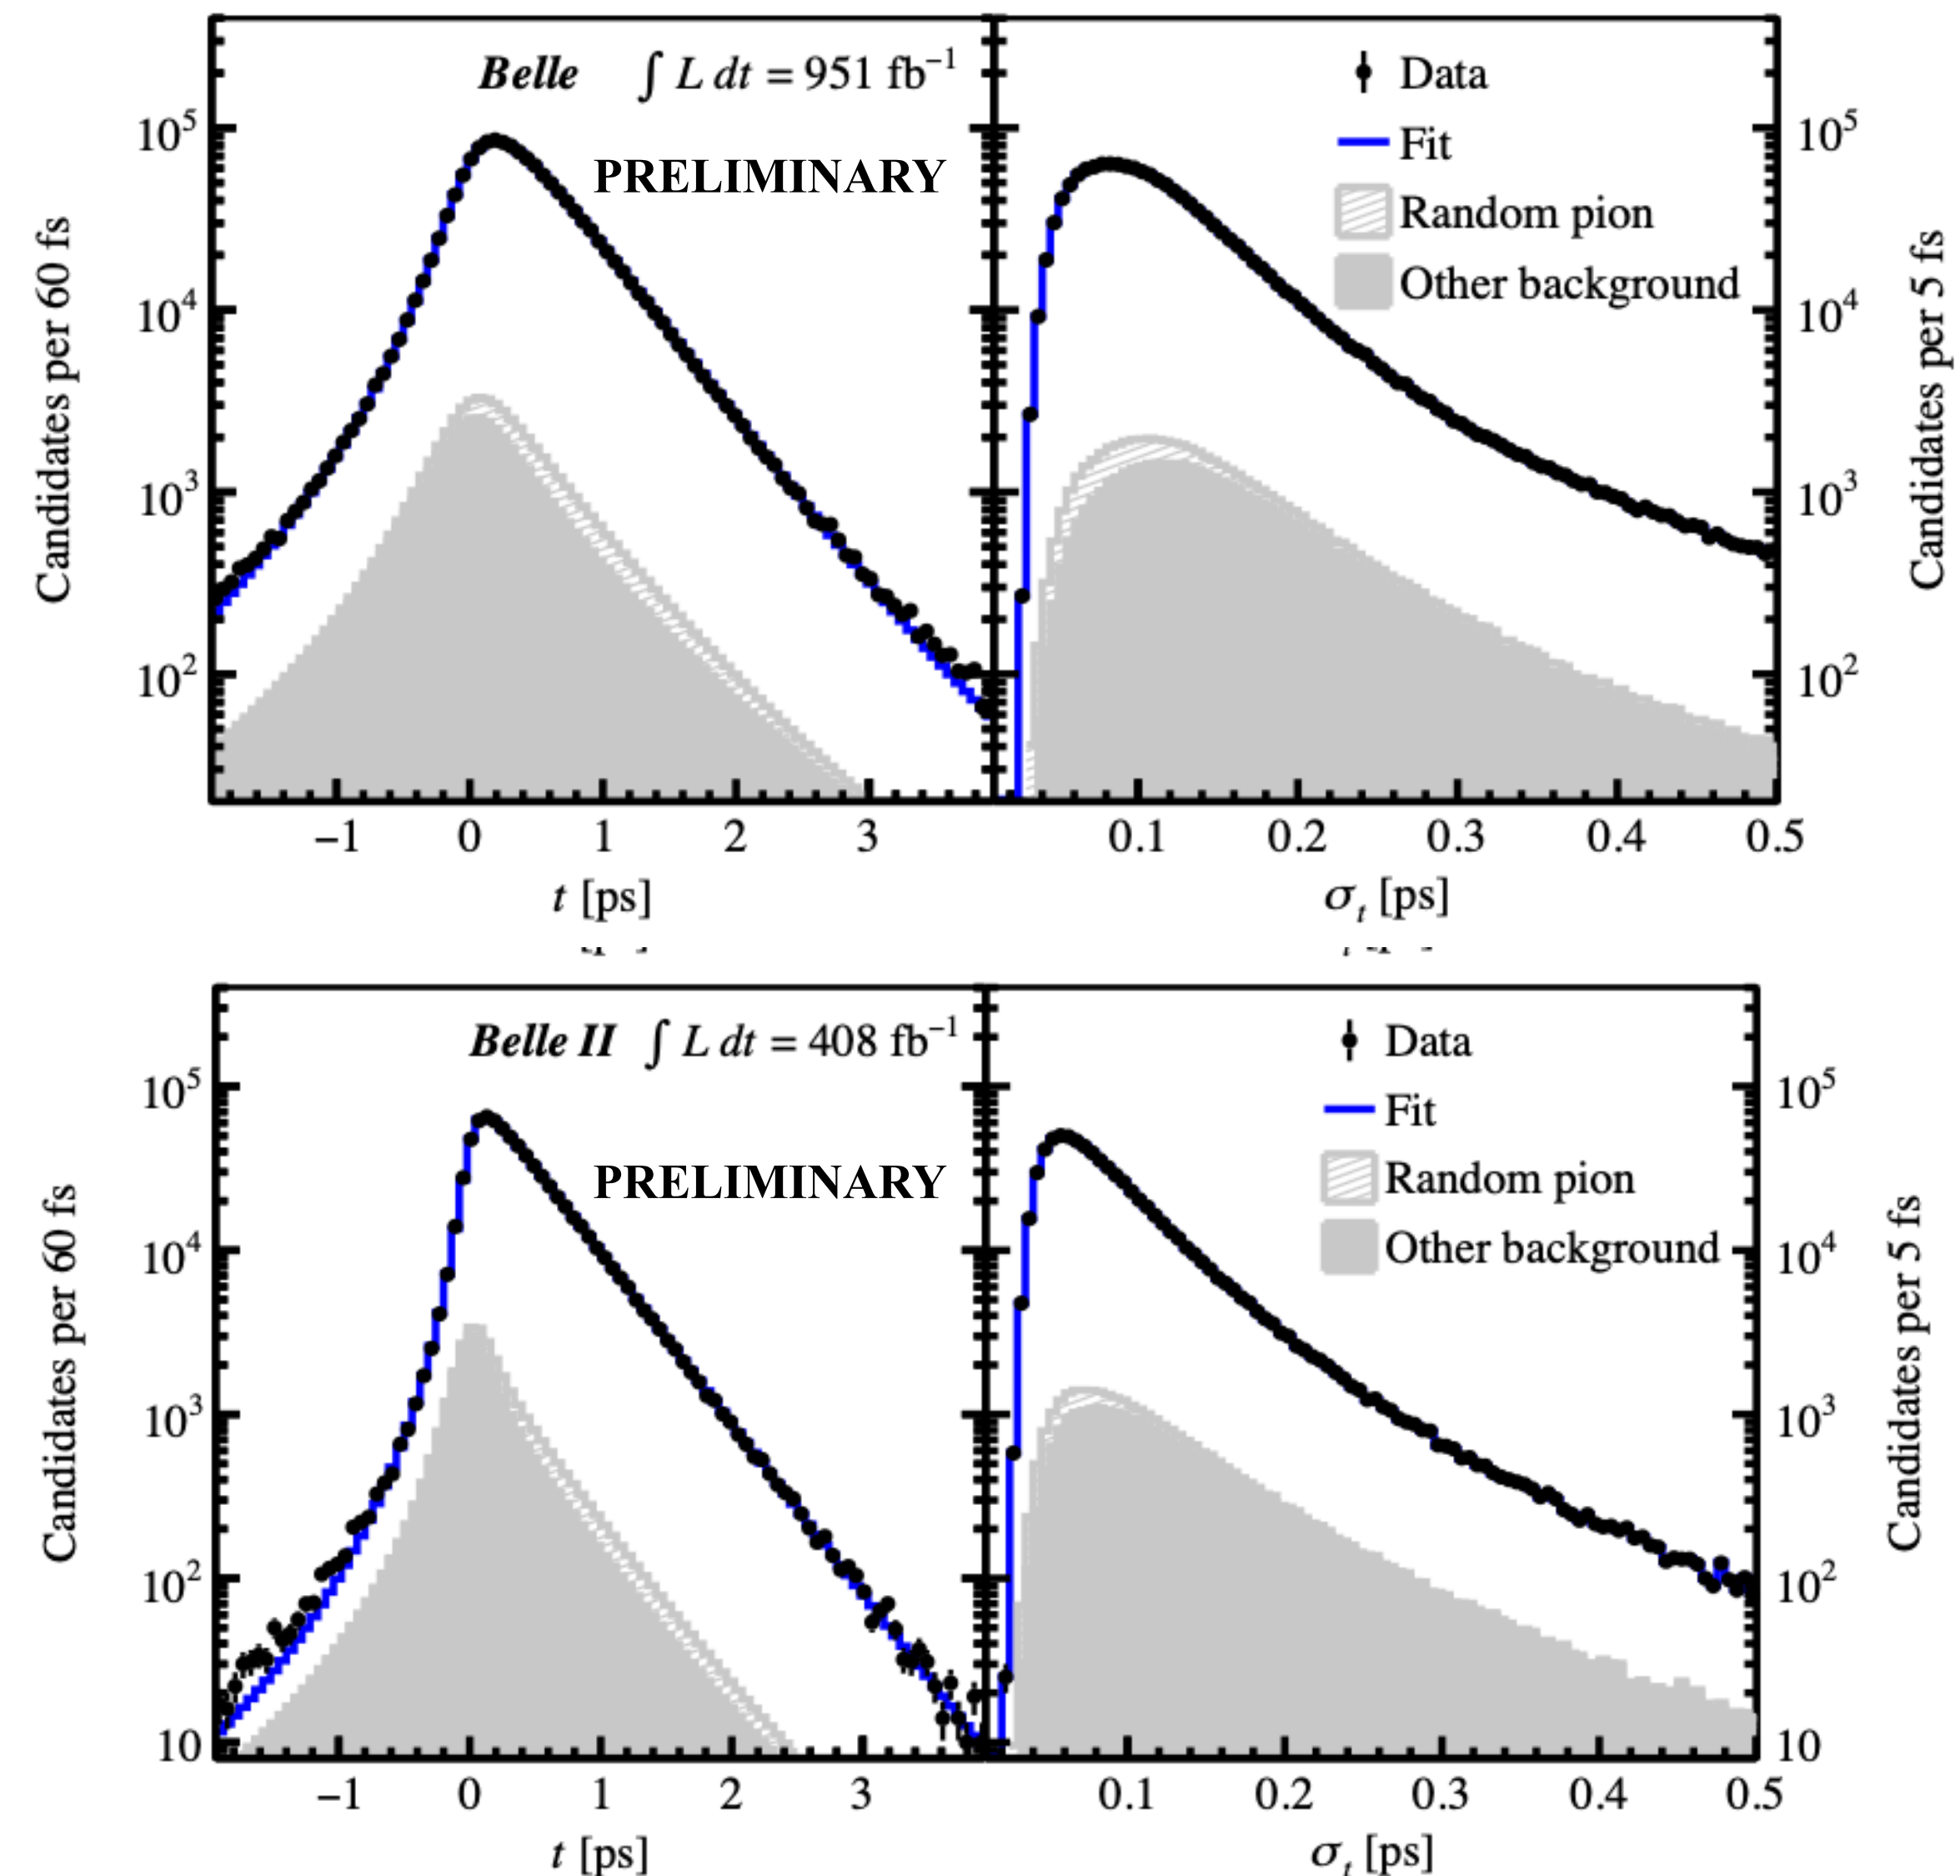

$$x = (4.0 \pm 1.7(stat) \pm 0.4(sys)) \times 10^{-3}$$
$$y = (2.9 \pm 1.4(stat) \pm 0.3(sys)) \times 10^{-3}$$

Correlation between x and y is negligible

Sample average purity 95.8%

Results 20% and 14% more precise than the currently model-dependent from only Belle dataset

Systematics smaller than Belle analysis model-dependent

- Using combined datasets from Belle and Belle II

- Several theoretical approaches developed to deal with non-factorizable amplitudes from W-exchange and internal W-emission

- Experimental measurements on BF will help clarify theoretical predictions

- First measurements of all the three BFs
- Favoring predictions in **SU(3)** flavour symmetry [JHEP 02,235 (2023)]

$$\mathcal{B}(\Xi_c^0 \rightarrow \Xi^0 \pi^0) = (6.9 \pm 0.3(stat) \pm 0.5(sys) \pm 1.5(norm)) \times 10^{-3}$$

$$\mathcal{B}(\Xi_c^0 \rightarrow \Xi^0 \eta) = (1.6 \pm 0.2(stat) \pm 0.2(sys) \pm 0.4(norm)) \times 10^{-3}$$

$$\mathcal{B}(\Xi_c^0 \rightarrow \Xi^0 \eta') = (1.2 \pm 0.3(stat) \pm 0.1(sys) \pm 0.3(norm)) \times 10^{-3}$$

- Using combined datasets from Belle and Belle II
- Also first asymmetry parameter $\alpha(\Xi_c^0 \rightarrow \Xi^0 \pi^0)$ measurement, related to P-violation (also comparable to theoretical expectations)

$$\alpha(\Xi_c^0 \rightarrow \Xi^0 \pi^0) = -0.90 \pm 0.15(stat) \pm 0.23(sys)$$

Through a simultaneous fit depending on the differential decay rate

$$\frac{dN}{d\cos\theta_{\Xi^0}} \propto 1 + \alpha(\Xi_c^0 \rightarrow \Xi^0 h^0)\alpha(\Xi^0 \rightarrow \Lambda\pi^0)\cos\theta_{\Xi^0}$$

$$\alpha(\Xi^0 \rightarrow \Lambda\pi^0) = -0.349 \pm 0.009$$

Conclusions

- Belle continues to produce important measurements more than 10 years after data taking
- First **model-independent** measurement of $D^0 - \bar{D}^0$ mixing 20% and 14% more precise than previous model-dependent measures
- First measurements of all three $\mathcal{B}(\Xi_c^0 \rightarrow \Xi^0 h^0)$ and asymmetry parameter for $\Xi_c^0 \rightarrow \Xi^0 \pi^0$
 - ▶ Asymmetry parameters for $\Xi_c^0 \rightarrow \Xi^0 \eta$ and $\Xi_c^0 \rightarrow \Xi^0 \eta'$ will become accessible with the larger data sample to be collected by Belle II in the future

Looking forward to more data in the coming years

Thank you for your attention

Back up slides

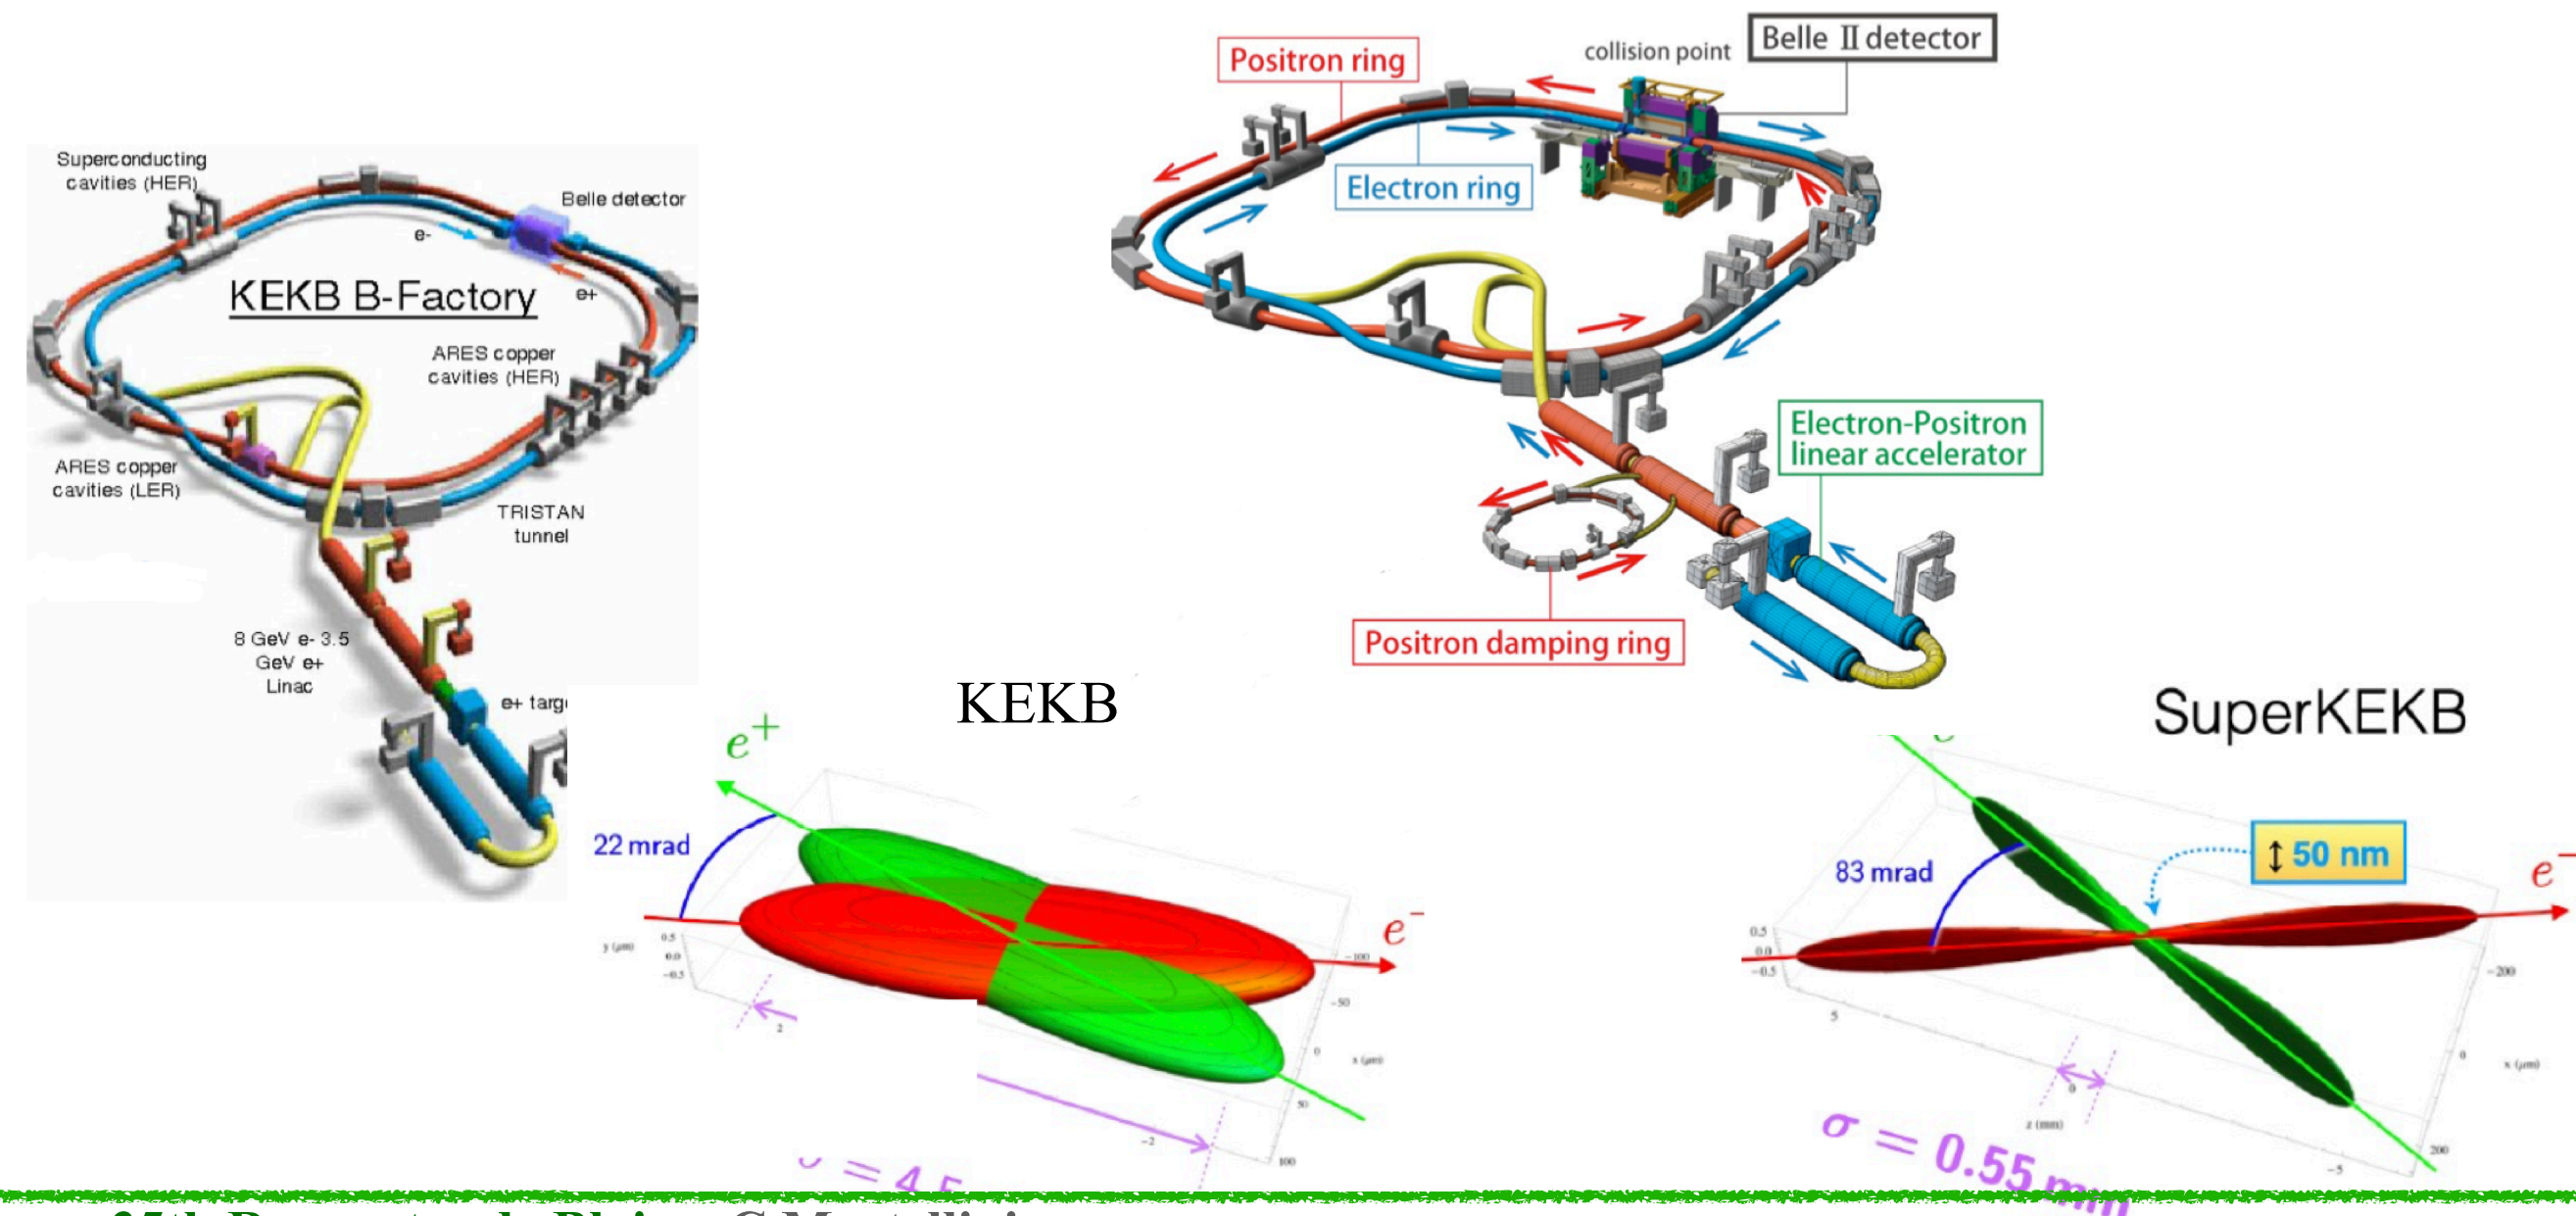

KEK-SUPERKEKB complex

- Asymmetric e^+e^- colliders
- Collisions mainly at 10.58 GeV, i.e. at $\Upsilon(4S)$ resonance

KEKB

1999-2010

- e^+ (3.5 GeV) e^- (8 GeV)
- L_{peak} : $2.1 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$ [achieved]

SuperKEKB

2019-current

- e^+ (4 GeV) e^- (7 GeV)

Target:

$$\int L dt = 50 \text{ ab}^{-1}$$

$$L_{peak} = 6 \times 10^{35} \text{ cm}^{-2}\text{s}^{-1}$$

Achieved:

$$\int L dt > 530 \text{ fb}^{-1}$$

$$L_{peak} = 4.7 \times 10^{34} \text{ cm}^{-2}\text{s}^{-1}$$

Current world record

Searching for New Physics in charm decays

Three paths for discovery

- Processes **allowed** in the Standard Model at **tree level**

- SM rates and uncertainties are known
- e.g. CKM triangle relations

- Processes **suppressed** in the Standard Model at **tree level**

- New physics may contribute at a detectable level beyond the SM prediction
- e.g. penguin decays, D-mixing

- Processes **forbidden** in the Standard Model to **all orders**

- Any evidence may indicate new physics
- Sometimes complicated by SM backgrounds

Highlights:

- BF of $\Xi_c^0 \rightarrow \Xi^0 h^0$
- CPV in $D_{(s)}^+ \rightarrow K_S^0 K^- \pi^+ \pi^-$
- CP asymmetry in $D^0 \rightarrow K_S^0 K_S^0$
- Mixing in $D^0 - \bar{D}^0$

Beyond the SM physics

Open question unexplained by SM → New Physics beyond the SM

Belle & Belle II operates at the “Intensity Frontier”

High precision measurements , probing SM indirectly

- as measurements of the SM-forbidden or suppressed process

B-factories:

e^+e^- collider @ $\Upsilon(4S) \rightarrow B\bar{B}$

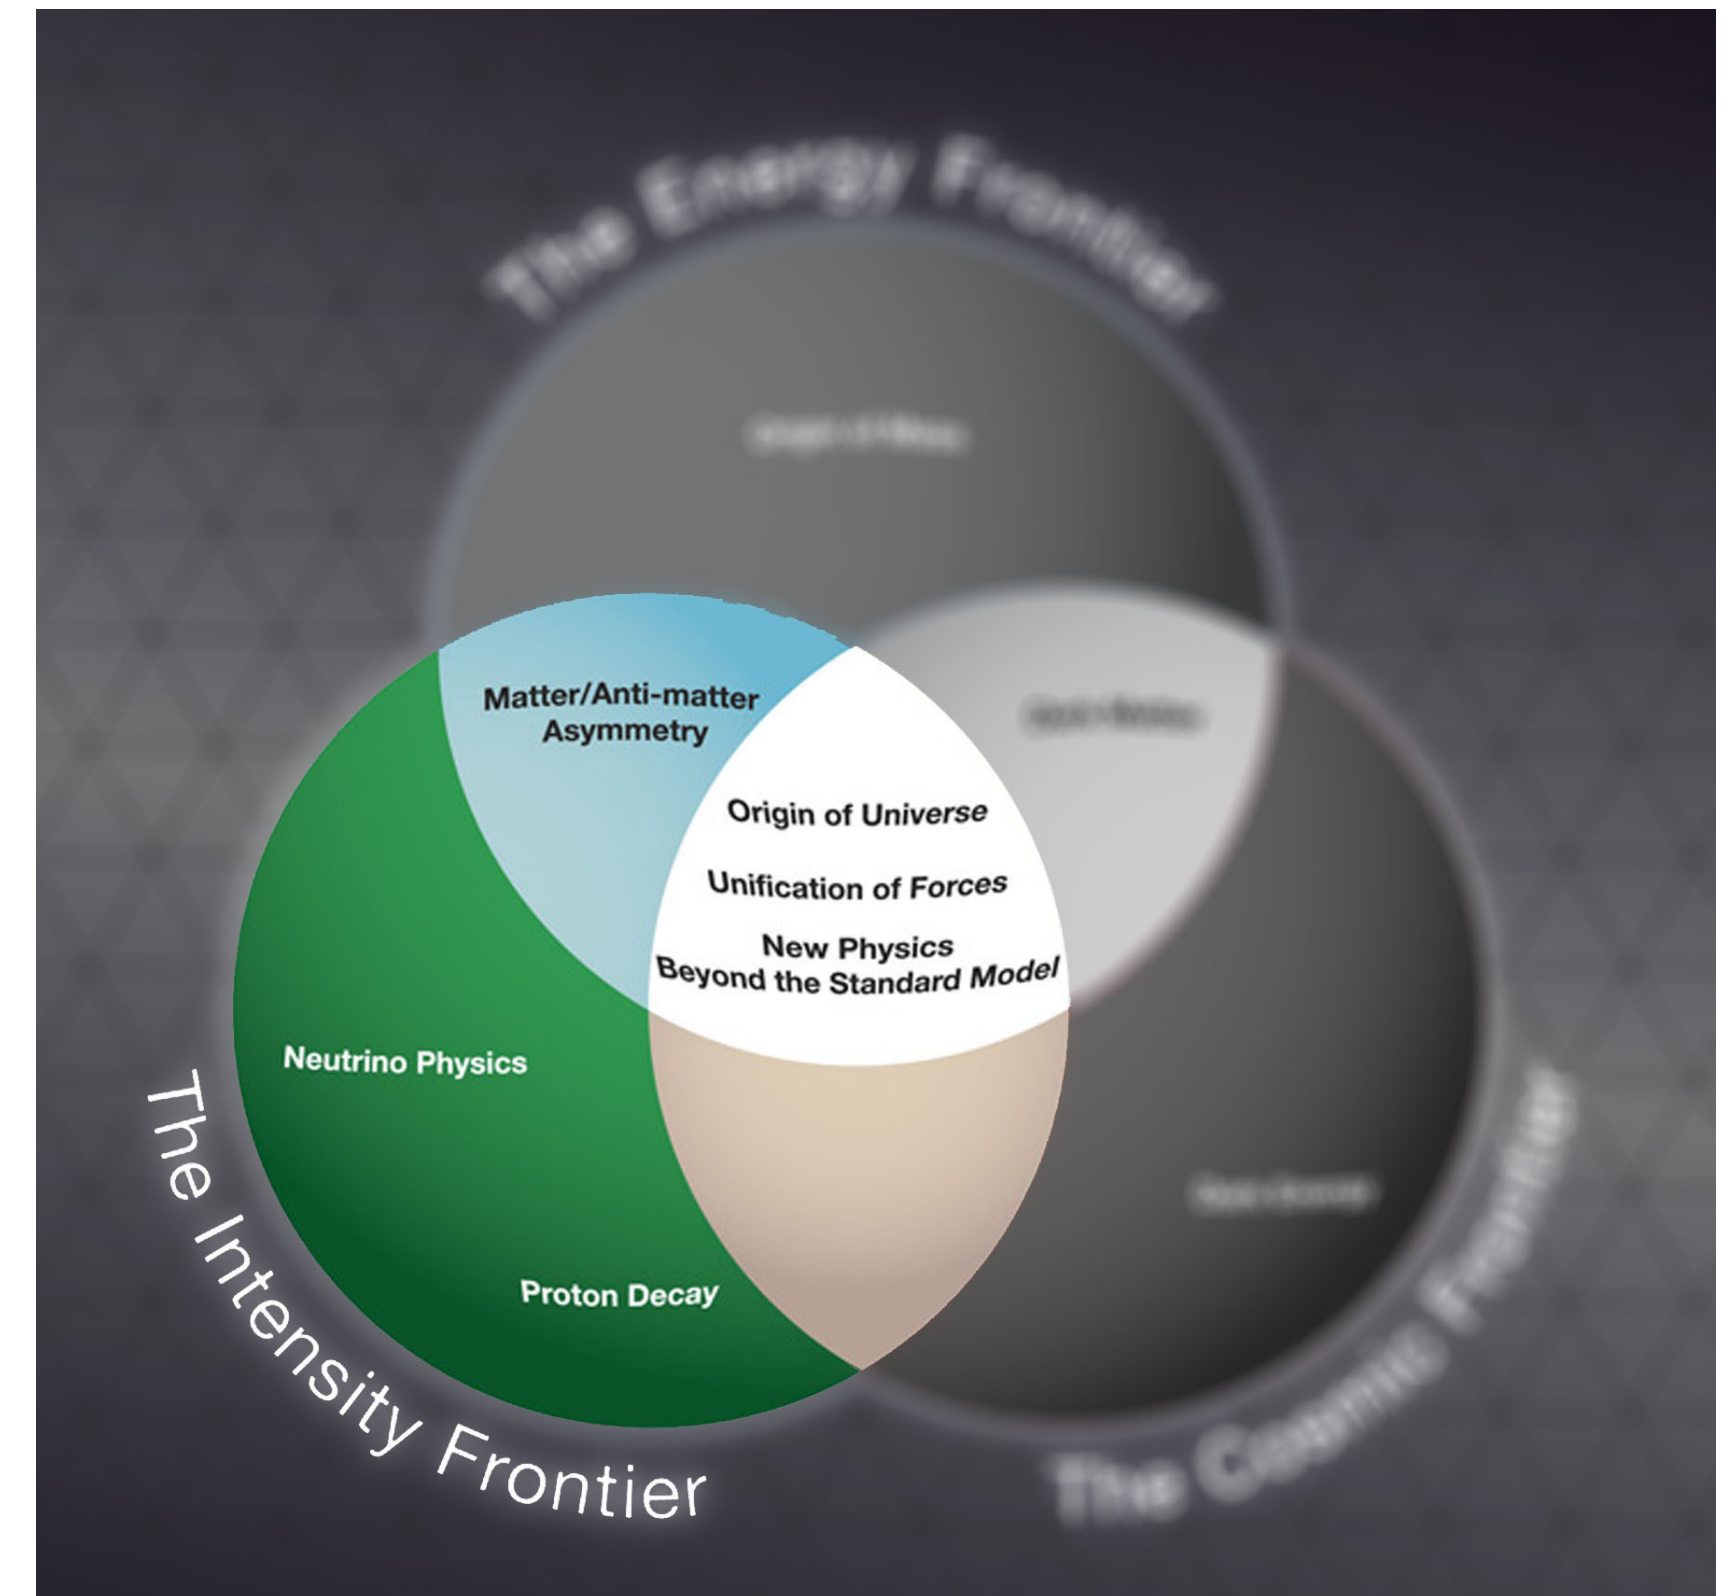

SLAC-PEP II collider : 462 fb^{-1}
@ $\Upsilon(4S)$ [1999-2008]

KEKB collider : 711 fb^{-1} @
 $\Upsilon(4S)$ [1999-2010]

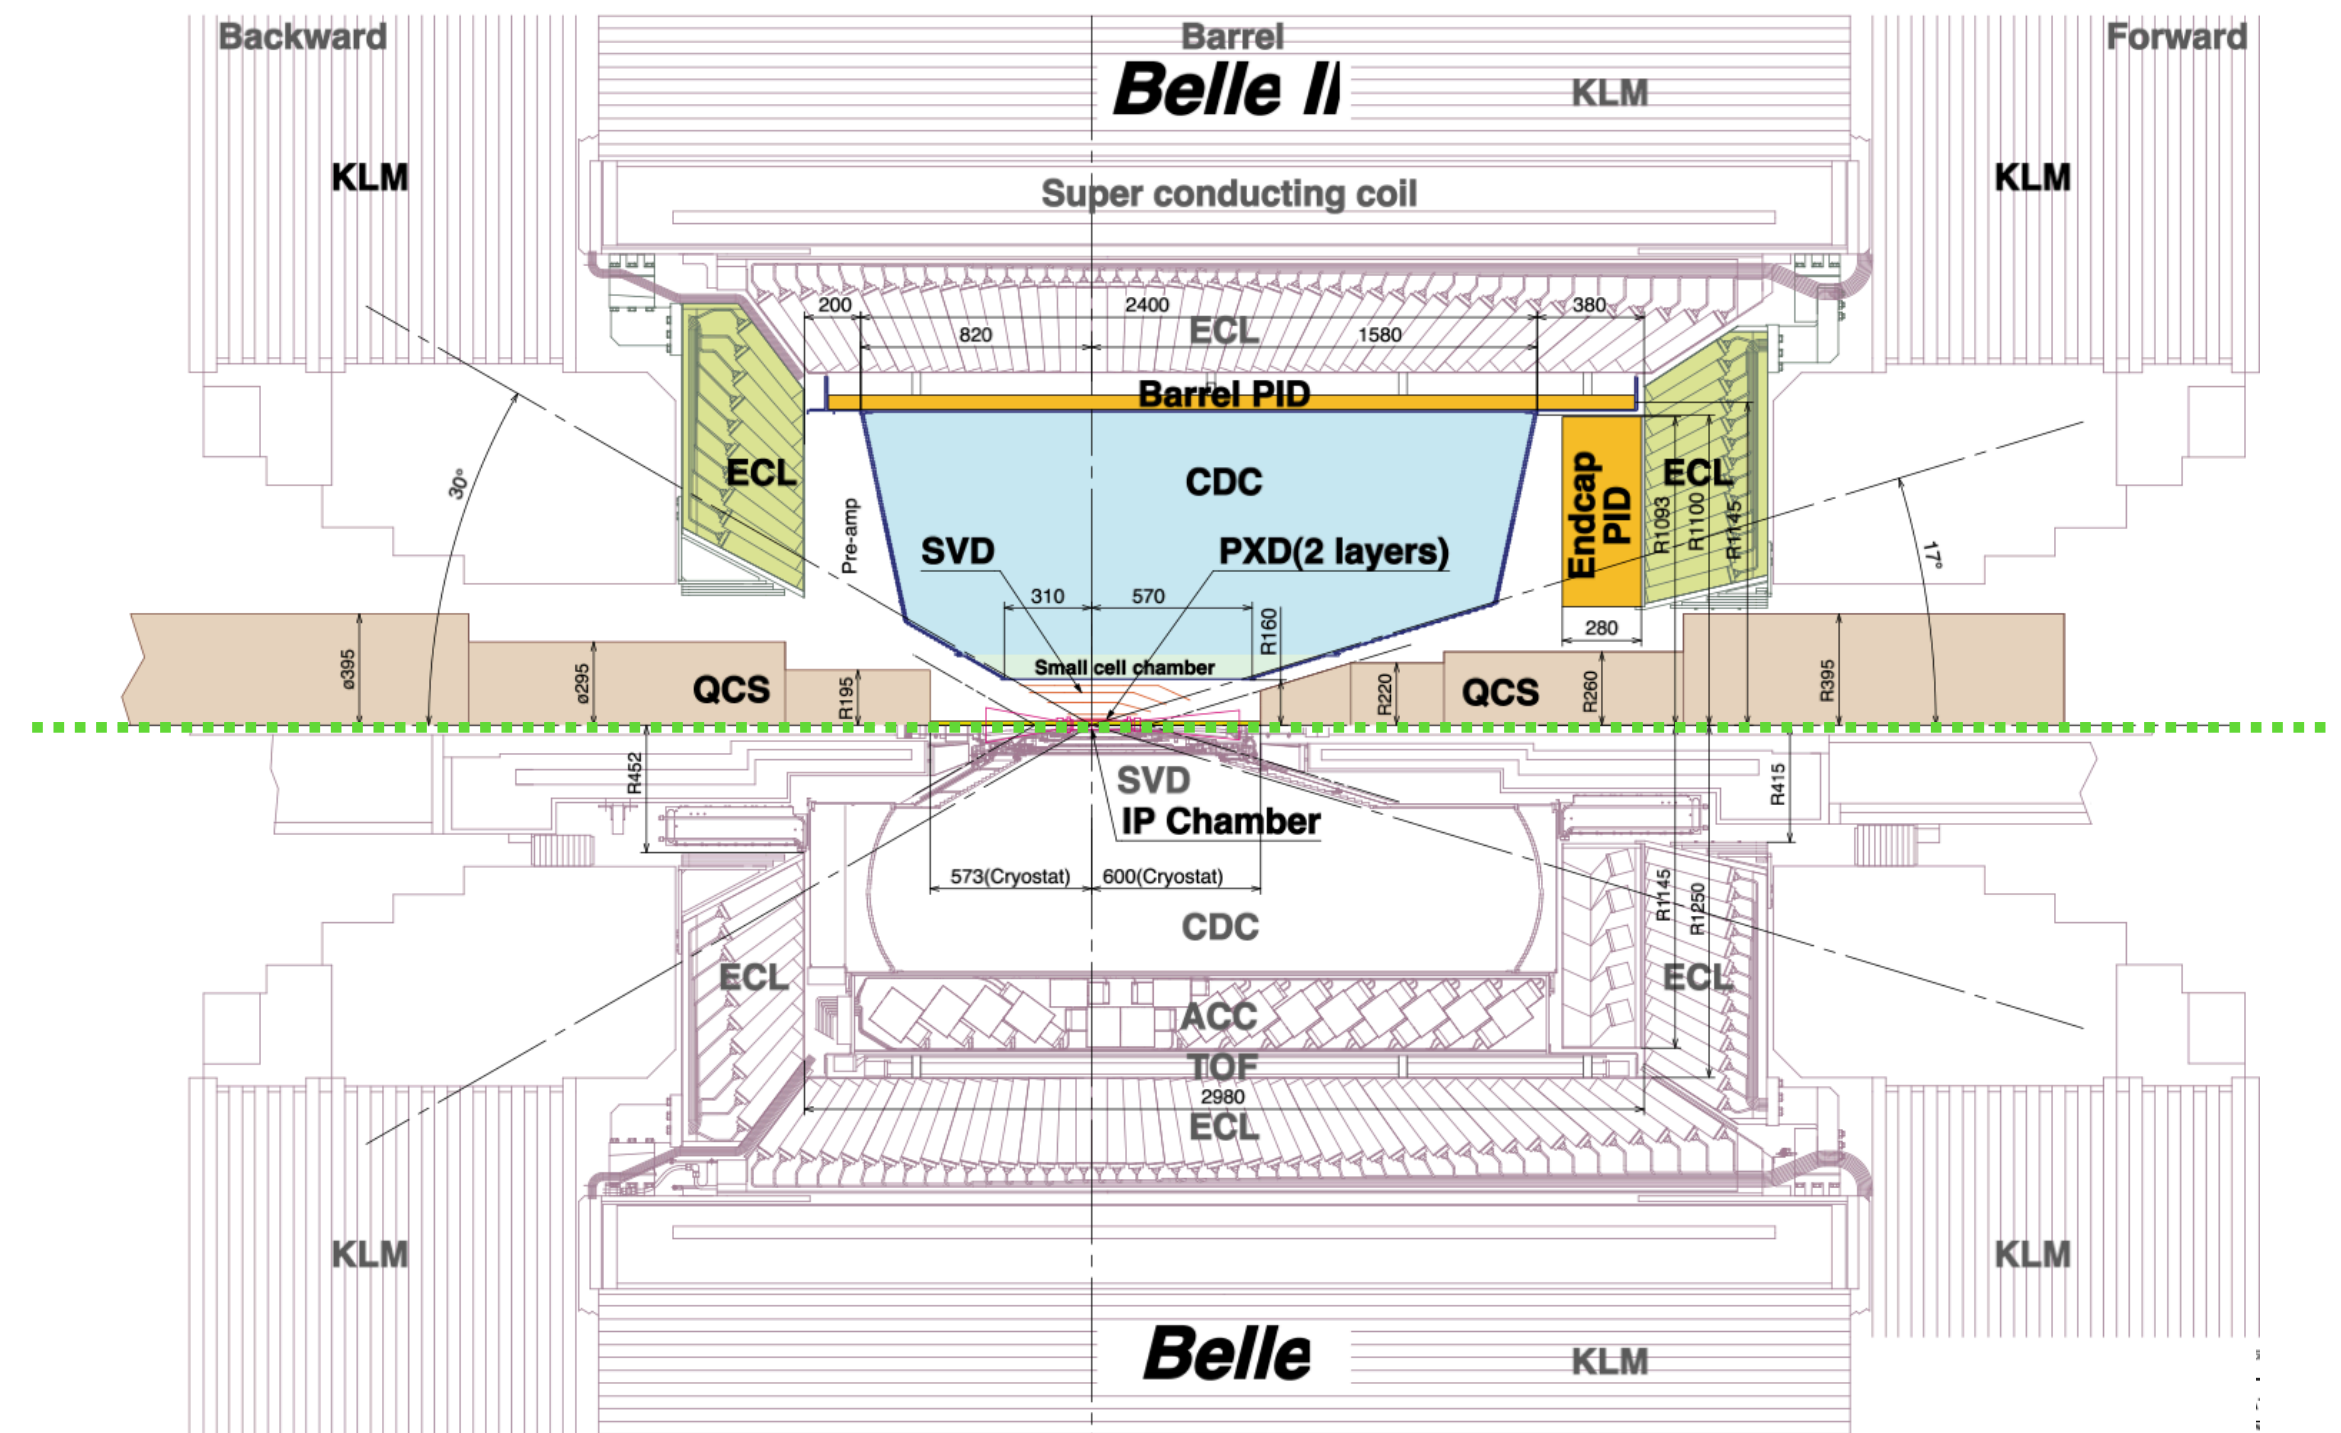

SuperKEKB collider : 530 fb^{-1} @
 $\Upsilon(4S)$ [2019-current]

Belle & Belle II detectors

- ECL** (electromagnetic calorimeter): Updated electronics
- PID** (Particle Identification): Better K/π separation under higher bkg level
- CDC** (Central drift chamber): larger volume, smaller drift cells and faster electronics
- VTX:**
 - + 2 layers PXD (pixel detector)
 - + 4 layers SVD (Silicon vertex detector)

[Belle II TDR](#)

- Well-known initial state condition
- Benefits from clean environment
- Efficient reconstruction of **neutrals**
- Boosted center of mass that allows for time-dependent measurements
- Hermetic detectors → ideal for studying neutral or invisible decays

Belle II data -taking

Updated on 2024/07/01 09:43 JST

We are suffering from **sudden beam loss events**, with large doses at the interaction region.

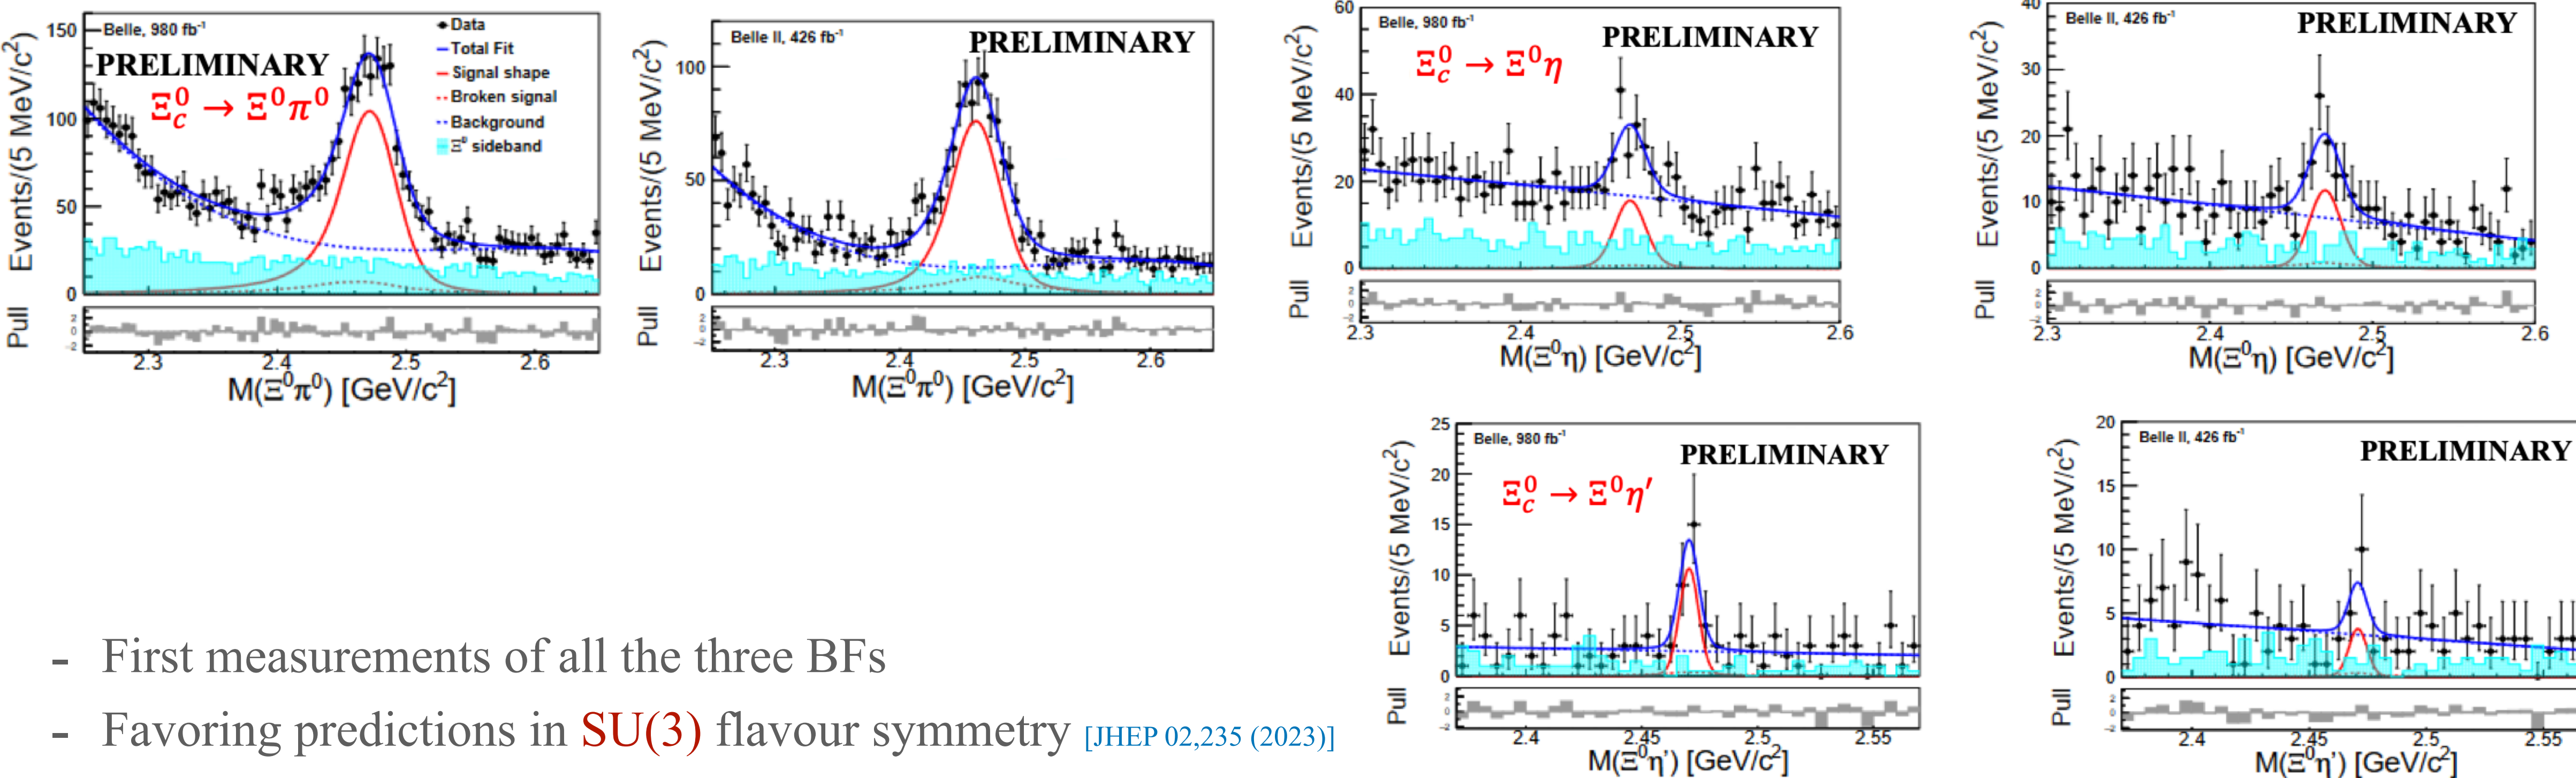

In a couple of them two channels of **PXD** were **damaged**

- as a precaution, it has been decided to **keep PXD off** while investigating the sources of the sudden beam loss and implement countermeasures to stabilize the beam operation

- Using combined datasets from Belle and Belle II

- Several theoretical approaches developed to deal with non-factorizable amplitudes from W-exchange and internal W-emission
- Experimental measurements on BF will help clarify theoretical predictions

- First measurements of all the three BFs
- Favoring predictions in **SU(3)** flavour symmetry [JHEP 02,235 (2023)]

Time-integrated CP asymmetry in $D^0 \rightarrow K_S^0 K_S^0$

Preliminary,
paper in preparation

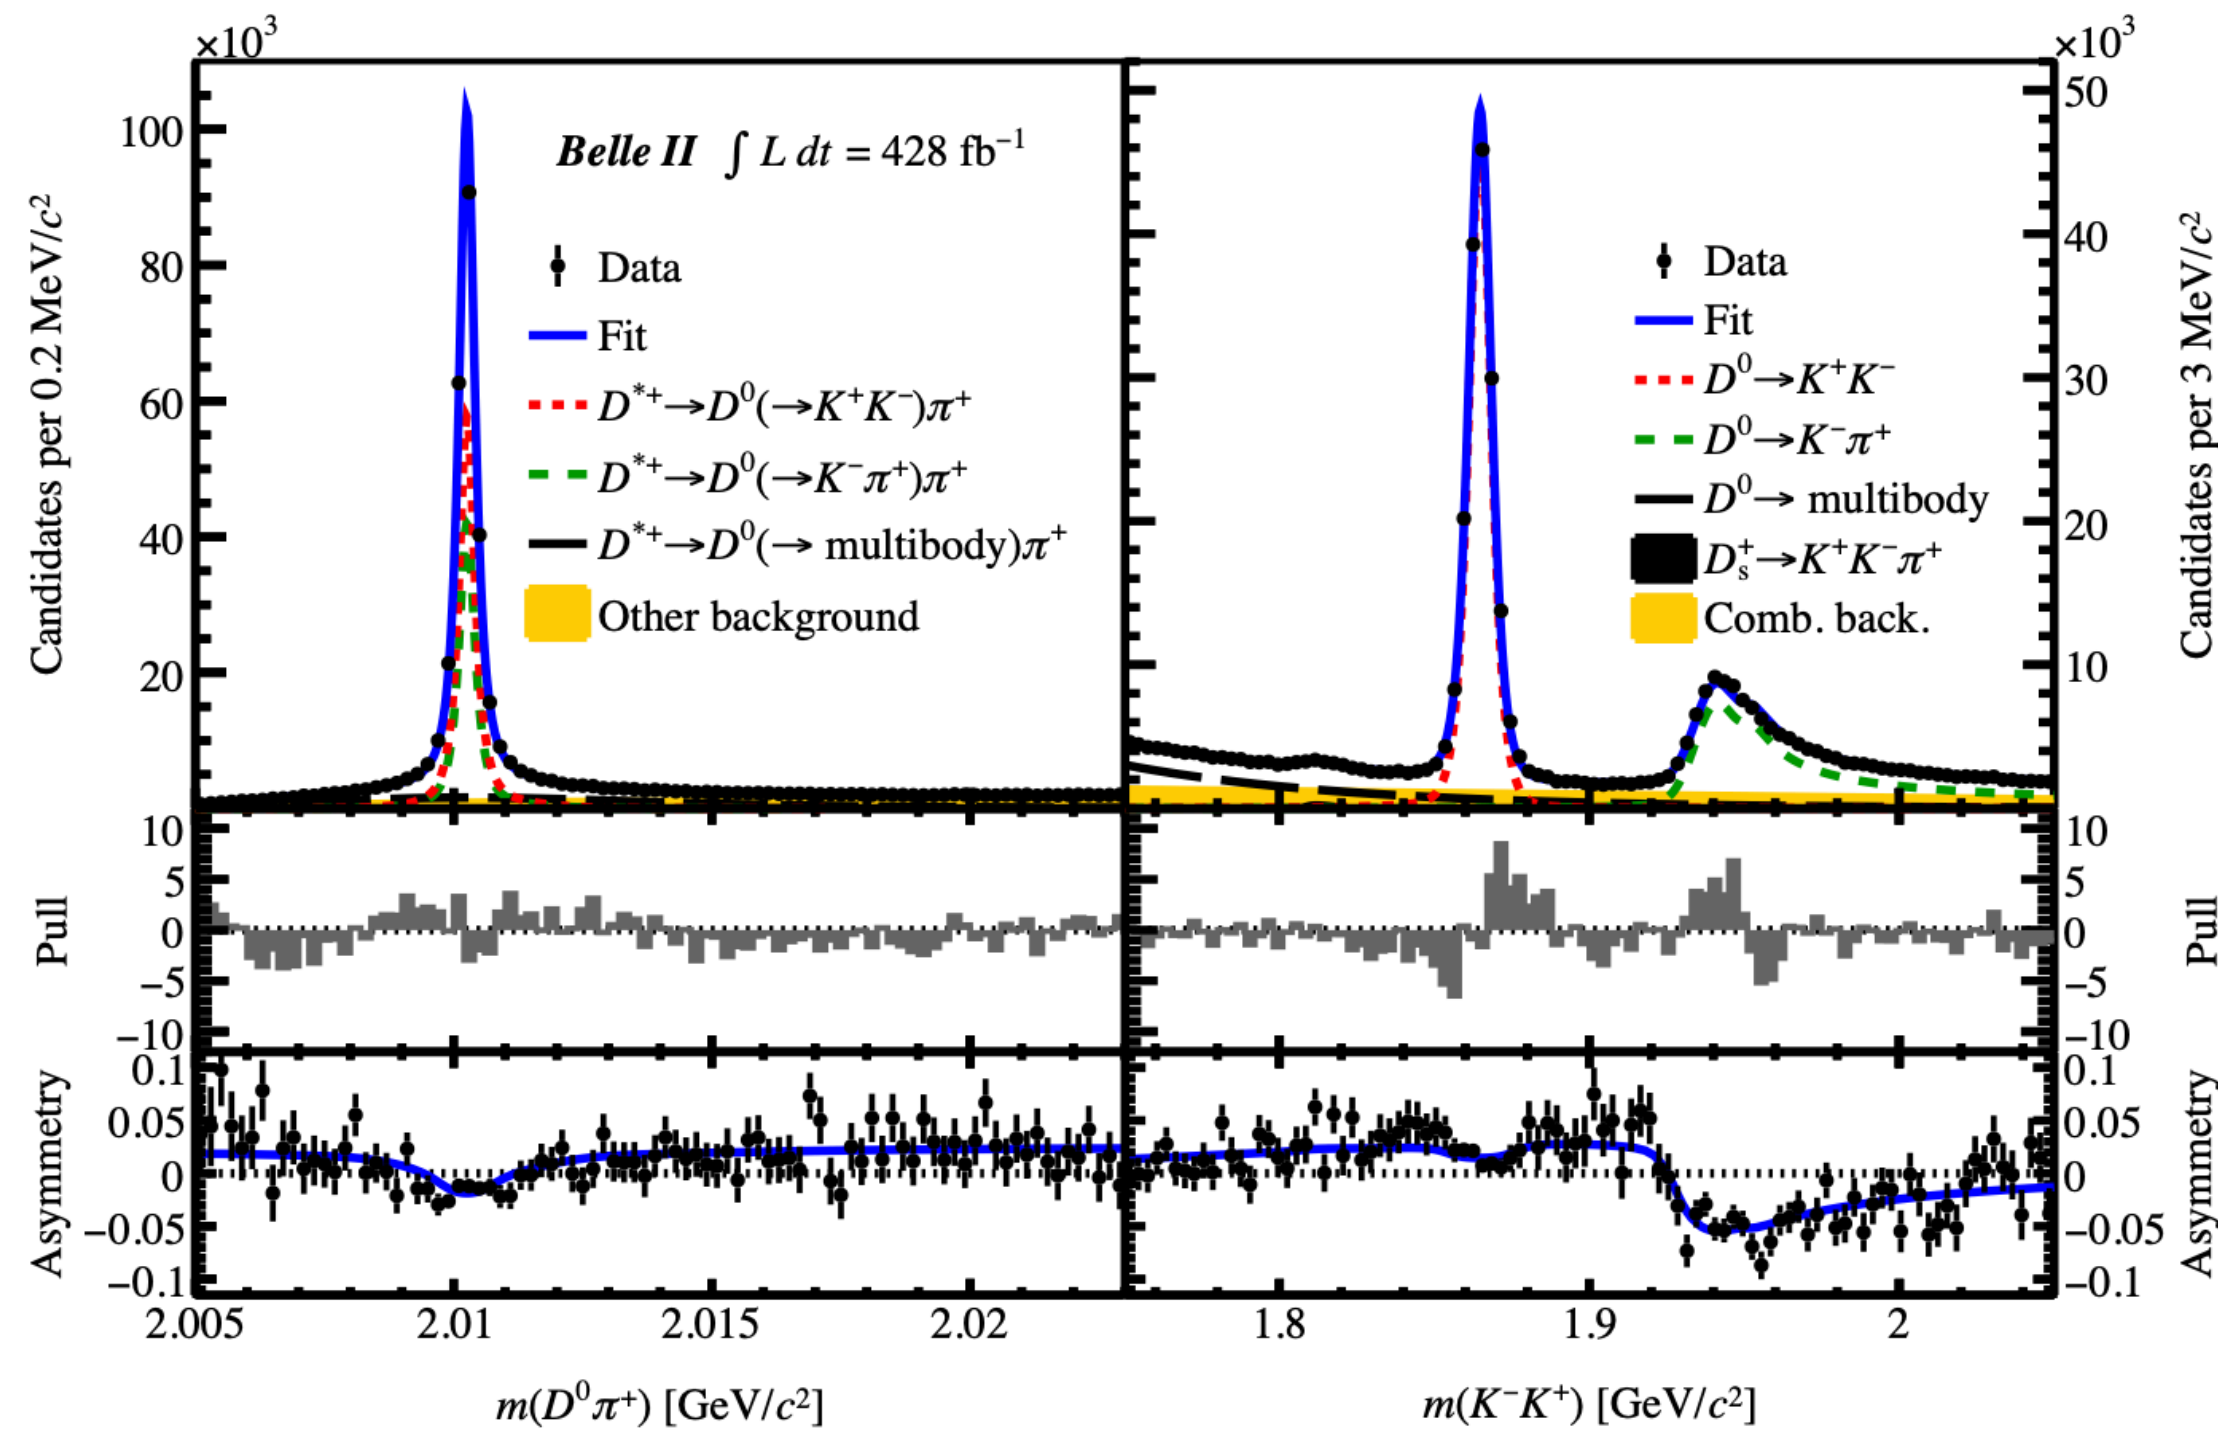

- Using combined datasets from Belle and Belle II

- We introduce a background rejection variable

$$S_{min}(K_S^0) = \log[\min(L_1/\sigma_{L_1}, L_2/\sigma_{L_2})]$$

- Fit to $m(D^0\pi^+)$ and $S(K_S^0)$ to extract signal yield and raw asymmetry

- $D^0 \rightarrow K^+K^-$

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (-1.1 \pm 1.6 \pm 0.1) \% \quad \text{Belle}$$

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (-2.2 \pm 2.3 \pm 0.1) \% \quad \text{Belle II}$$

$$A_{CP}(D^0 \rightarrow K_S^0 K_S^0) = (-1.4 \pm 1.3 \pm 0.1) \% \quad \text{Belle + Belle II}$$

Charm mixing in $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays

Preliminary,
paper in preparation

- Using combined datasets from Belle and Belle II

Item	Belle	Belle II
K_S^0 selection	All K_S^0 in K_S0:mdst $0.488 < M(\pi^+\pi^-) < 0.508 \text{ GeV}/c^2$ $L/\sigma_L > 20$ (after the first TreeFit below)	Merge V0 candidates and two charged pions combinations apply TreeFitter $0.488 < M(\pi^+\pi^-) < 0.508 \text{ GeV}/c^2$ $L/\sigma_L > 20$ (after the first TreeFit below)
Tracks directly from D^0 and the slow pion		$ \Delta r < 1.0 \text{ cm}$ $ \Delta z < 5.0 \text{ cm}$
remove B mesons decay		$p^*(D^*) > 2.5 \text{ GeV}/c$ for $\Upsilon(4S)$ $p^*(D^*) > 3.1 \text{ GeV}/c$ for $\Upsilon(5S)$
Vertex Fitting		First fit : TreeFit with K_S^0 mass constraint, IP constraint, daughter momentum update $\chi^2 < 200$ Second fit : TreeFit with D^0 and K_S^0 mass constraints, IP constraint, daughter momentum update
		Cloned tracks removal
signal region		$ M(K_S^0 \pi^+ \pi^-) - m_{D^0} < 15 \text{ MeV}/c^2$ $4.85 < Q < 6.85 \text{ MeV}/c^2$
sideband		$1.97 < M(K_S^0 \pi^+ \pi^-) < 2.00 \text{ GeV}/c^2$ $Q < 20 \text{ MeV}$

Charm mixing in $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays

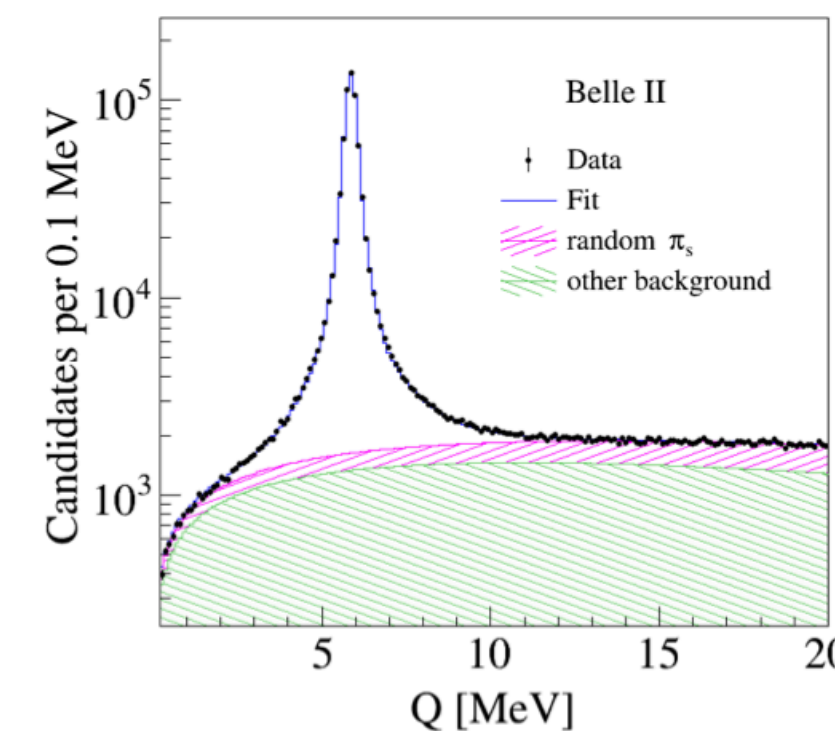

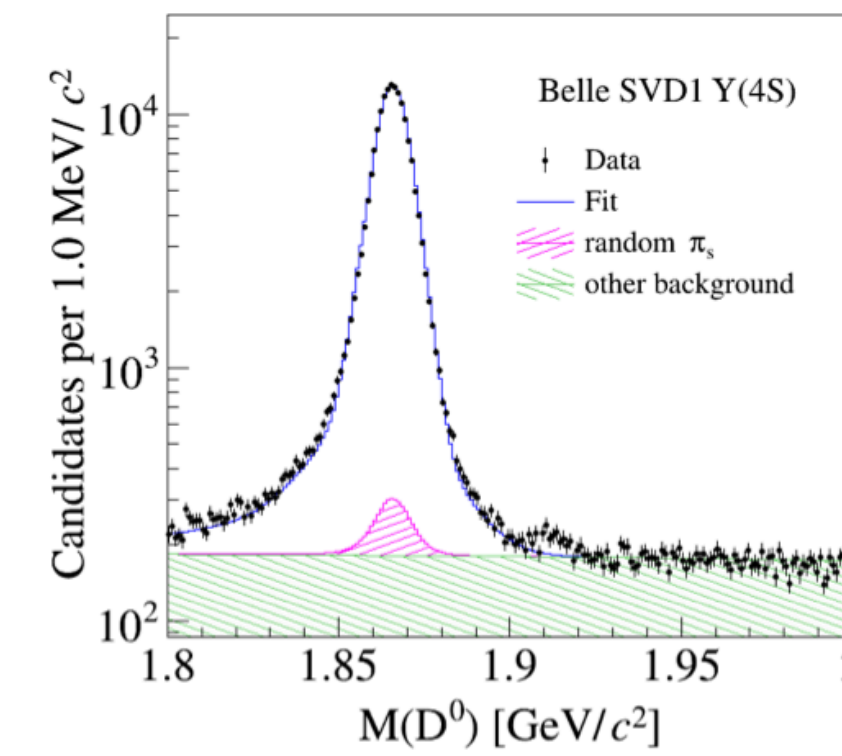

Preliminary,
paper in preparation

- Using combined datasets from Belle and Belle II

Result of the (M,Q) fit to the data integrated over the Dalitz-plot bins to the Belle II and Belle data samples

Sample	Signal yield [10^6]	Average purity [%]
Belle II	0.697	95.6
Belle SVD1 $\Upsilon(4S)$	0.163	95.9
Belle SVD2 $\Upsilon(4S)$	1.014	95.7
Belle SVD2 $\Upsilon(5S)$	0.176	97.5
Total	2.049	95.8

$$x = (4.0 \pm 1.7(stat) \pm 0.4(sys)) \times 10^{-3}$$

$$y = (2.9 \pm 1.4(stat) \pm 0.3(sys)) \times 10^{-3}$$

Correlation between x and y is negligible

Results 20% and 14% more precise than the currently model-dependent from only Belle dataset

Systematics smaller than Belle analysis

Sample average purity 95.8%

Charm mixing in $D^0 \rightarrow K_S^0 \pi^+ \pi^-$ decays

Preliminary,
paper in preparation
