

News in ROOT I/O

Monday 26 March 2007 15:00 (30 minutes)

For the last several months the main focus of development in the ROOT I/O package has been consolidation. In addition to reducing the coupling with the core module and becoming its own library (libRIO) (See separate talk on the restructuration of the ROOT libraries), the I/O package has been enhanced in the area of XML and SQL support, thread safety, schema evolution and TTreeFormula, and many other areas. We will also review a few new utilities, including a generic mechanism for object references and a faster implementation of TTree cloning.

Presenter: CANAL, Philippe (FNAL/CD)
