MICROCONTROLLERS

Maurício Féo m.feo@cern.ch CERN

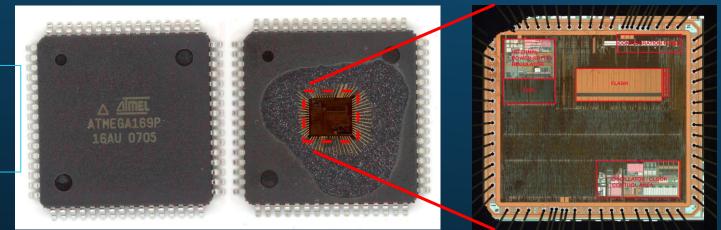

OBJECTIVES

Understand what are microcontrollers.

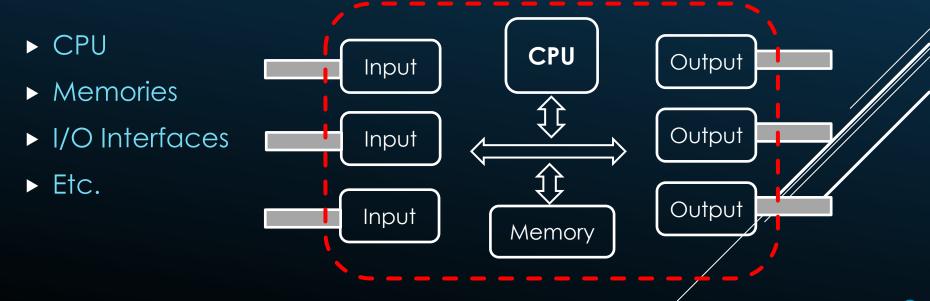

- And how can they be useful for you
- Have an overview of programmable devices.
- Example of applications.

WHAT IS A MICROCONTROLLER?

Tiny computer integrated in the same chip.

WHAT IS A MICROCONTROLLER?

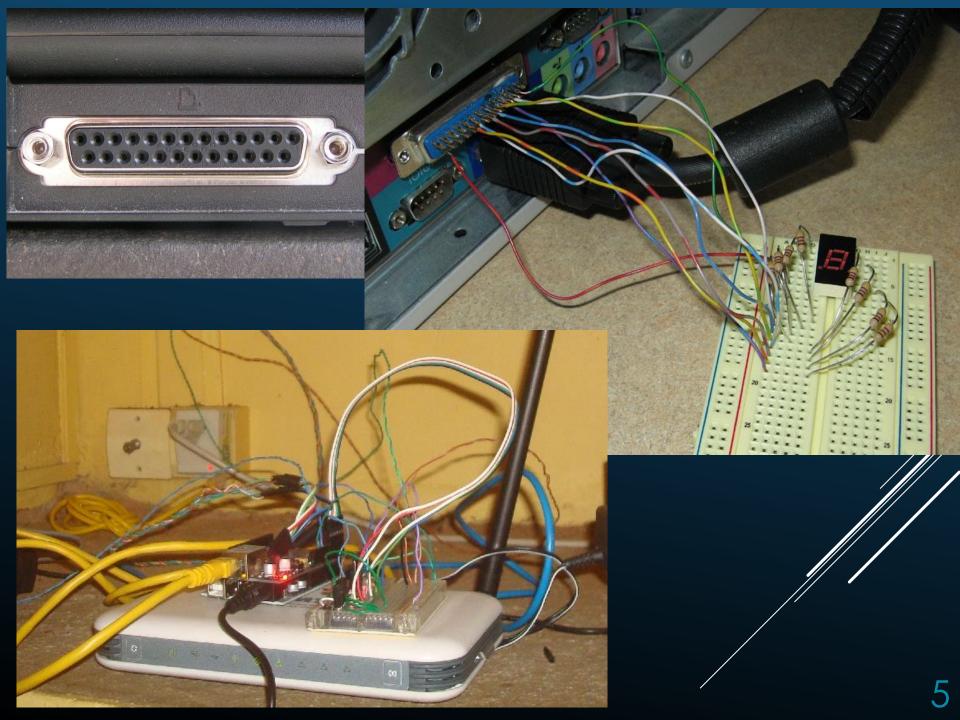

Tiny computers integrated into a single chip

CPU, Memories, and Peripherals included.

Main differences w.r.t. a computer:

- Suitable for embedded applications.
- ► Low cost (ATtiny9: ~\$0.27)
- Low power consumption (PIC16LF: 50µA/MHz or 20nA sleep)
- Reduced clock frequency (~ dozens of MHz)
- Stand-alone devices (Some require only power to work)
- Low-level control of your application.

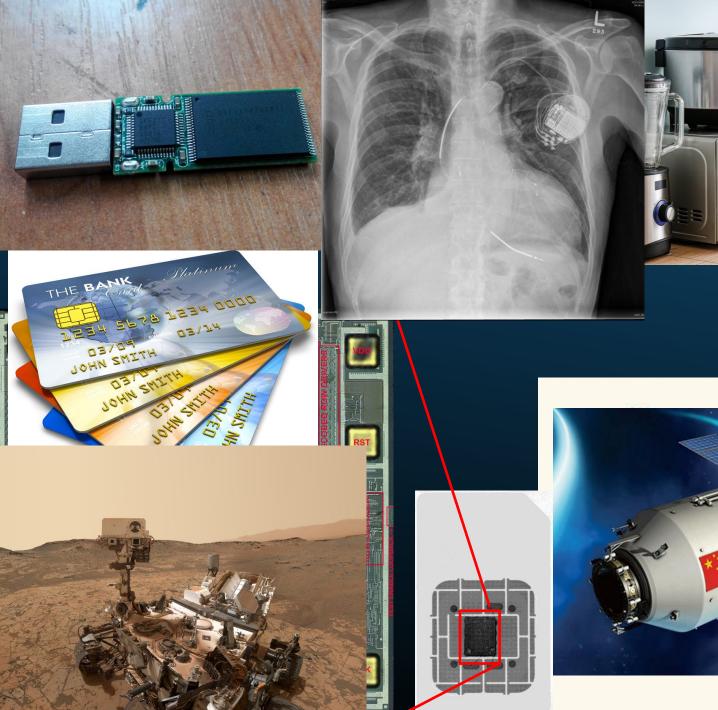

WHAT ARE THEY USED FOR?

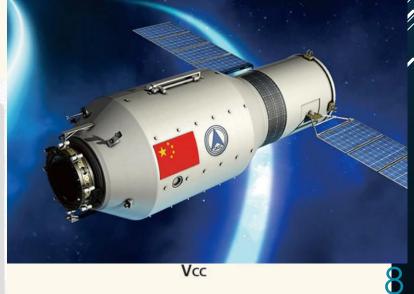

- Monitoring
- (Slow) Data Acquisition
- Control
- Applications where:
 - High performance is not required.
 - Other devices are inadequate (overkill) due to:
 - ► High power consumption;
 - Need of external memories and peripherals;
 - ► Cost;
 - ► Etc.

WHERE ARE THEY USED?

- Everywhere!
- Consumer electronics, home appliances, toys, vehicles, computers, hobbyist projects, etc.
- According to Wikipedia trusted sources, a typical mid-range automobile has as many as 30 or more microcontrollers.
- According to me an even more trusted source, you have many in your pockets right now.

1

▶ 8 bits architecture

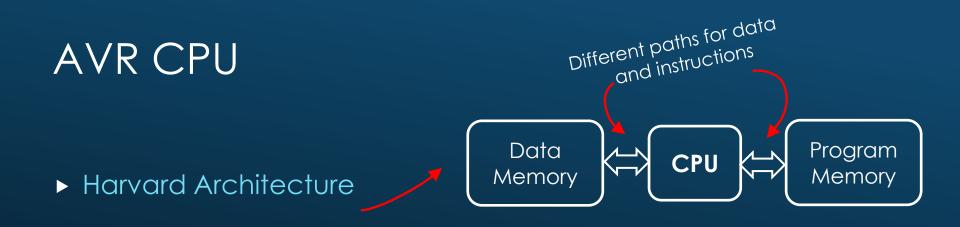

- 32kB Flash program memory
- ► 2kB RAM
- ► 2kb EEPROM
- Max 20MHz
- ► 6 x PWM
- 6 x ADC channels (10bits)
- ▶ 23 I/O pins
- 3 timers (2x8 bits 1x16 bits)
- 1x USART
- ► 1x SPI
- ▶ 1x TWI (I²C)
- 0.6mA/MHz

Ϊ.

T

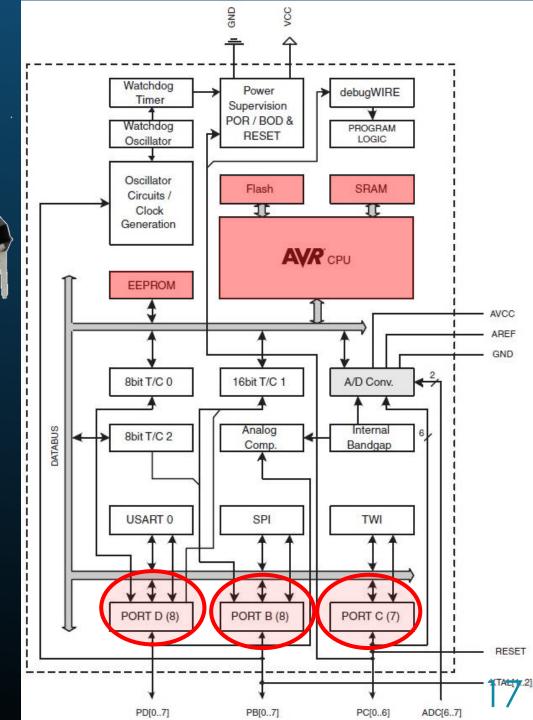

Maurício Féo - ISOTDAQ 2024

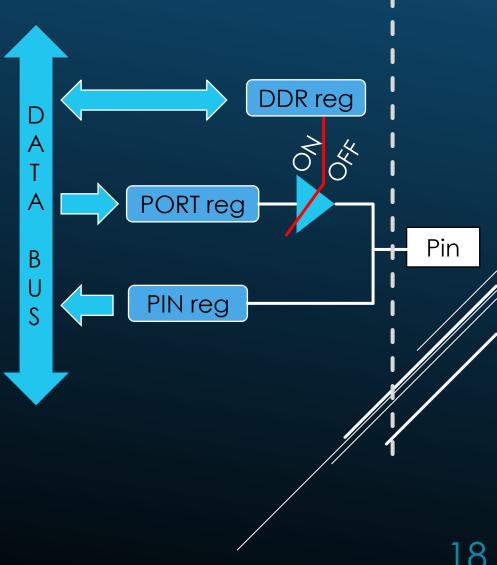

- ▶ <u>8 bits architecture</u> (with 16bits for instructions)
 - Instructions executed 8 bits by 8 bits
- Reduced Instruction Set Computing (RISC) (~130 instructions)
- Up to 20 MIPS at 20 MHz (1 instruction / clock cycle)

Contraction of the second seco

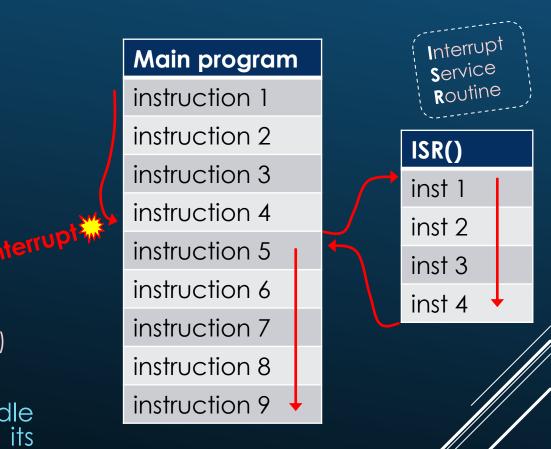

GENERAL PURPOSE INPUT/OUTPUT (GPIO)

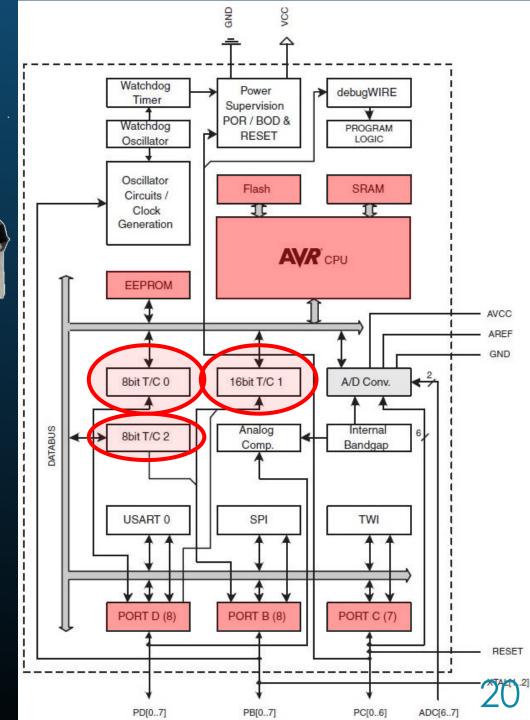

- Pins programmable as Input and Output
- Read / Write digital signals
- ▶ '0' = 0V (Gnd), '1' = 5V (Vcc)
- Controlled by 3 registers:
- DDR (Data Direction Register)
- PORT (Where you write when it's output)
- PIN (Where you read when it's input)

INTERRUPT

- Interrupts break the program flow to handle some event.
- It may be triggered by:
 - Pin change (rise/fall/toggle)
 - Timers / Counters
 - Analog Comparator
 - ADC reading done
 - Serial interfaces (Rx/Tx done)
- It allows the program to handle an event "right after" its occurrence, regardless of where the program is and without the need of polling constantly.

TIMERS / COUNTERS

Internal registers that increment triggered by:

- A clock source: Timer
- An external event: Counter
- May be used to:
 - Measure time
 - Raise interruption on:
 - Overflow
 - Reach a certain value (OCR)
 - Create waveform
 - PWM

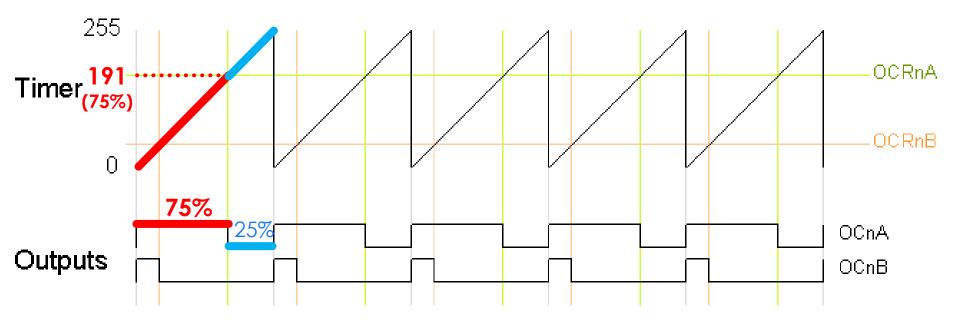

Ultrasonic distance sensor Measures distance based on the time to echo of an ultrasonic pulse.

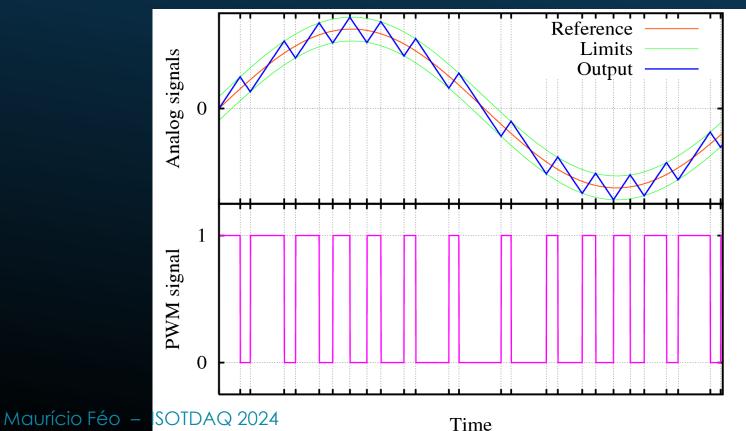

PULSE WIDTH MODULATION (PWM)

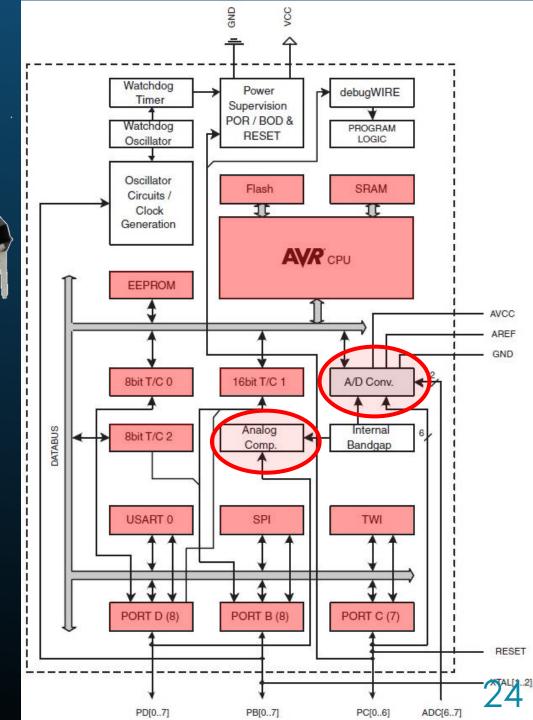

- You can create an output signal which value depends on the status of the timer.
- Outputs a train of periodic digital pulses with controlled width.
 - (Can be used to "mimic" an analog signal)

PULSE WIDTH MODULATION (PWM)

- You can create an output signal which value depends on the status of the timer.
- Outputs a train of periodic digital pulses with controlled width.
 - (Can be used to "mimic" an analog signal)

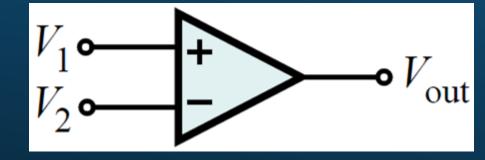

ANALOG COMPARATOR

- Tells whether positive pin AIN0 voltage is higher than negative pin AIN1.
- Output is the internal bit ACO* of reg ACSR*.
- Can be used to:
 - Compare two analog signals
 - Trigger a Timer/Counter
 - Trigger an interrupt (rise, fall or toggle)

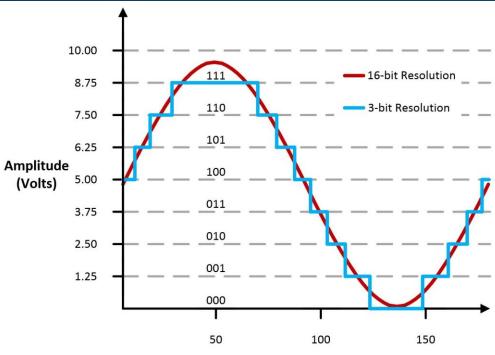

ACO = Analog Comparator Output
 ACSR = Analog Comp. Control and Status Register

 $V_1 > V_2 \longrightarrow V_{out} = 1$ $V_1 < V_2 \rightarrow V_{out} = 0$

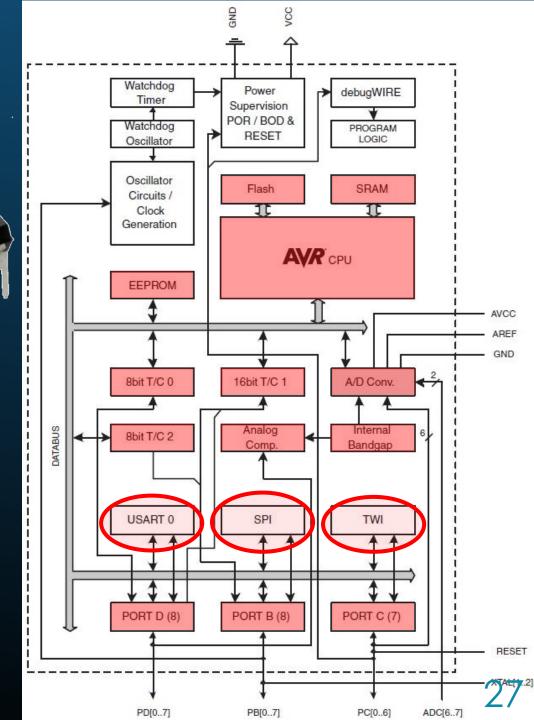

ANALOG TO DIGITAL CONVERTER (ADC)

- ► 10-bit resolution
 - ▶ 0V-Vref \rightarrow 0-1023
- Vref can be:
 - Vcc (Power source)
 - 1.1V internal ref.
 (from bandgap)
 - External ref. on pin 'AREF'
- Successive approximation
 - 13-260 us Conversion time
- Interrupt on complete
- 6 multiplexed channels on DIP package
 - (internal Temp sensor on ch8)

Time (ms)

CONTRACTOR OFFICE

SERIAL INTERFACES: USART UNIVERSAL SYNCHRONOUS-ASYNCHRONOUS RECEIVER TRANSMITTER

1

LSB

- A simple protocol
- Widely used to communicate with PCs due to compability with RS232 protocol. (RS232 is not used anymore in most PCs but it's still very easy to find USB-Serial converters)

50-

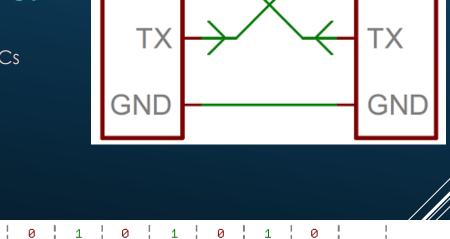

ØŬ

Idle

Start

Bit

- Up to 250kbps
- May trigger interrupts:
 - ► Tx complete
 - ► Rx complete
 - Data reg empty

RX

Idle

MSB

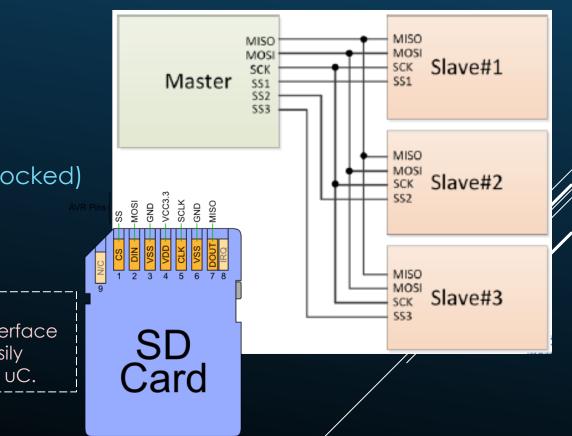

Stop

Bit

SERIAL INTERFACES: SPI SERIAL PERIPHERAL INTERFACE

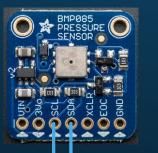

- Differently from the USART, SPI can talk to multiple devices on the same bus, but needs a Slave Select signal per Slave Device
- ▶ Up to 10Mbps! (clk/2)
- Slaves do not "talk" autonomously.
 - Must be querried (and clocked) by master.

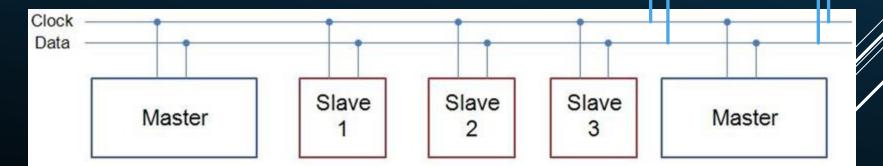

SD cards use the SPI serial interface and can be easily accessed from a uC.

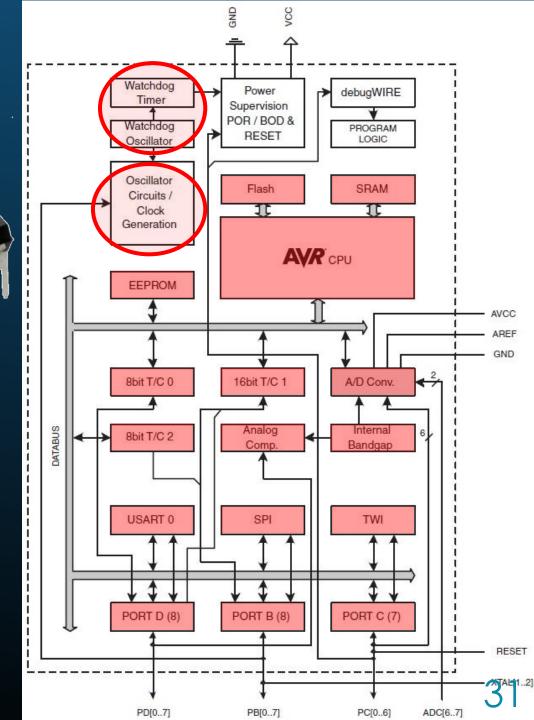

SERIAL INTERFACES: TWI (I²C) TWO WIRE INTERFACE (INTER-INTEGRATED CIRCUIT)

- I2C allows multiple Masters and Slaves on the same bus. (up to 128)
- Up to 400kbps (on the Atmega328)
- Used in a variety of digital sensors.

Contractor

WATCHDOG TIMER (WDT)

- A Watchdog Timer is a timer clocked by an on-chip oscillator
- Once the counter reaches a certain value, the WDT may:
 - Trigger an interrupt
 - Reset the microcontroller
- Used to prevent your program from getting stuck in any part of the code.
- You use it by enabling the WDT and spreading WDT reset instructions on particular places of your code.
 - If it gets stuck in an infinite loop, for ex., the counter won't be reset and the microcontroller will be reset.

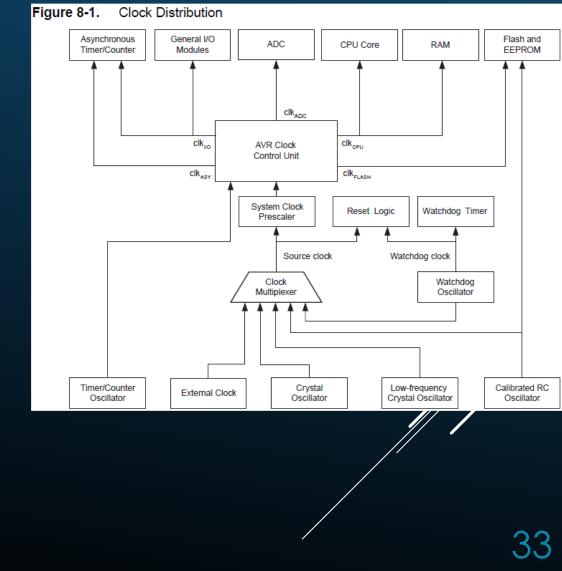

CLOCK CIRCUIT

▶ Up to 20MHz from:

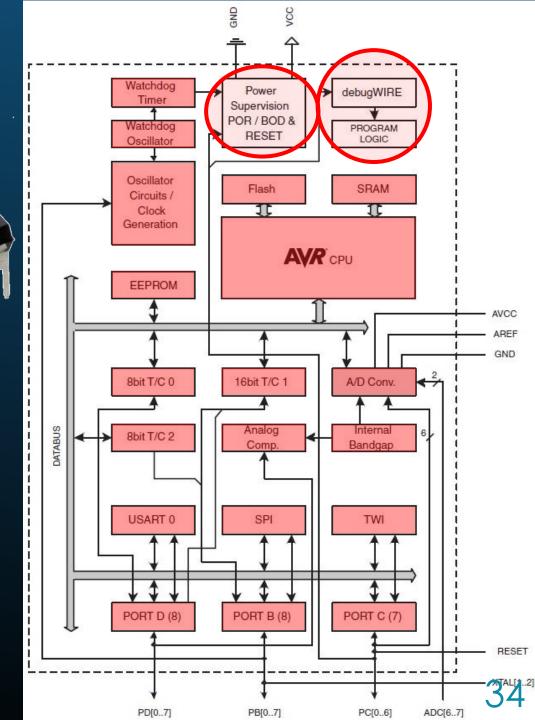

- External clock from a pin
- External crystal oscillator
- Internal RC oscillator
 - ▶ 7.3-8.1 MHz
- 128kHz Internal oscillator
 - ▶ 128 kHz
- System Clock Prescaler
 - Divides the clock if needed

► Keep in mind:

Power consumption is proportional to clock frequency.

COPPERAT

SLEEP MODES

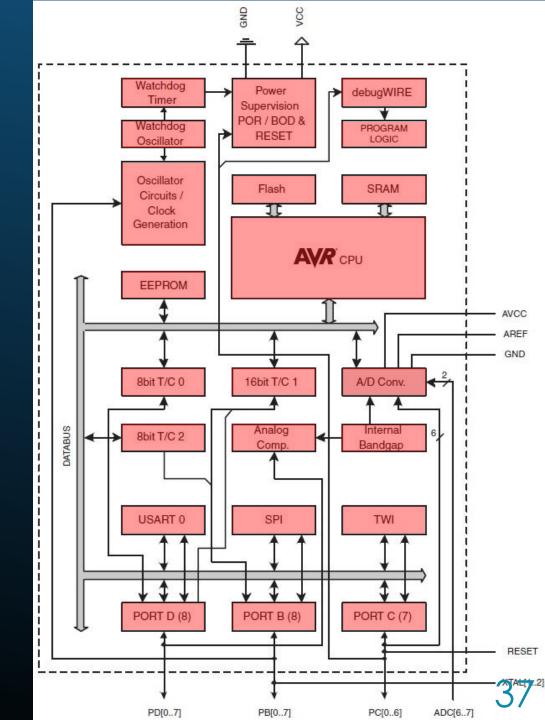

There are multiples Sleep Modes available. Each turns off certain parts of the microcontroller to save power and can only be waken up by certain sources.

Symbol	Parameter				Cor	ndition			Min.	-	Typ. ⁽²⁾		Max.		Units	
	down	mode ⁽³	3)	WD	T enab	led, V _{CC} :	= 3V			4.2		8		μA

POWER AND DEBUG

- Brown-Out Detector (BOD)
 - Resets the device whenever Vcc is below a certain threshold.
- Power-on Reset (POR)
 - Ensures the device is reset from Power On.
- ► DebugWIRE
 - On-chip debug tool from AVR.

REVIEW

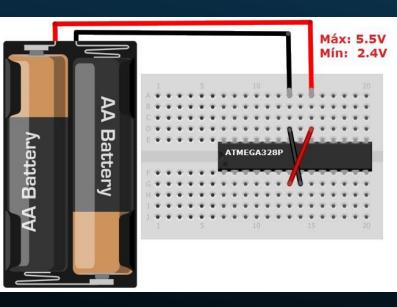

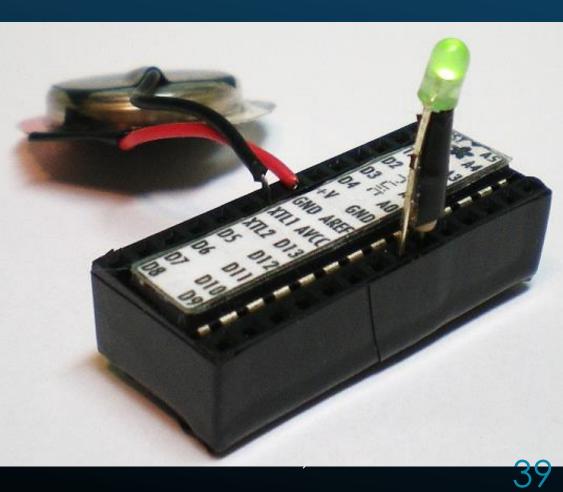

ATMEGA328 MINIMUM REQUIRED CIRCUIT NEEDED CIRCUITRY: USING AN EXTERNAL CRYSTAL

ATMEGA328 MINIMUM REQUIRED CIRCUIT NEEDED CIRCUITRY: USING THE INTERNAL OSCILLATOR

Atmega328 comes with an internal 8MHz oscillator that can minimize the required circuit to a single battery.

USAGE OF MICROCONTROLLERS DEVELOPMENT CYCLE

- Write your code. From Assembly to C. Or even higher level:
- ► Compile it. (debug)
- Upload to the uC memory (On Chip debug)
 - Parallel programming
 - Serial downloading (SPI)
 - Self-programming (With bootloader)
- (Burn the fuses)

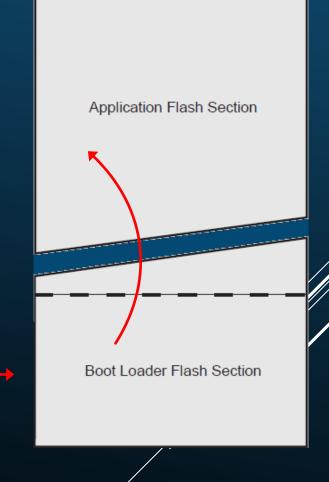

SELF-PROGRAMMING: BOOTLOADER

- The AVR core can write to it's own program memory.
- The Bootloader Section can be locked from rewritting.
- This way developers can allow users to write their own programs without compromising the bootloader section.
- This can also be used to ease the programming of the memory, eliminating the need for an external programmer.

USB-Serial

ARDUINO

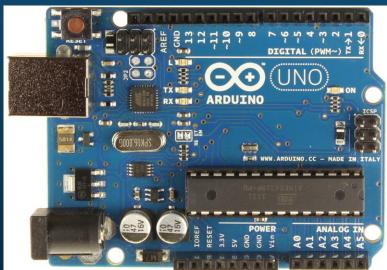

Arduino d'Ivrea , (Civica raccolta stampe - Milano)

ARDUINO

- Open-source platform created for "makers" who have no knowledge in electronics but still want their creations to interact with the environment.
- Custom IDE + libraries
- Inexpensive and really easy to use
 - (Almost plug and play)
- Huge community all over the world creating libraries, compatible hardware and sharing projects
- Stackable addons called shields

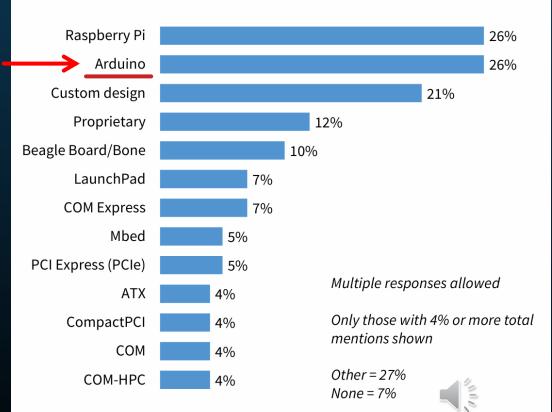

75% start their projects with dev. Boards

Which development boards are you currently using?

ADVANTAGES OF PROTOTYPING PLATFORMS

NEVER HAVE I FELT SO CLOSE TO ANOTHER SOUL

AND YET SO HELPLESSLY ALONE

AS WHEN I GOOGLE AN ERROR

AND THERE'S ONE RESULT

A THREAD BY SOMEONE WITH THE SAME PROBLEM

AND NO ANSWER

LAST POSTED TO IN 2003

http://xkcd.com/979/

ADVANTAGES OF PROTOTYPING PLATFORMS

PRO	CON
Community / Support / StackOverflow	Performance is generally not good
Much easier to learn	No full control over the code
Fast development and Prototyping	Cost is higher
Portable code between supported devices	TRU ENGINEERS gon' make fun of u cos ur not BRAVE ENOUGH to handle raw bits.

USAGE OF MICROCONTROLLERS

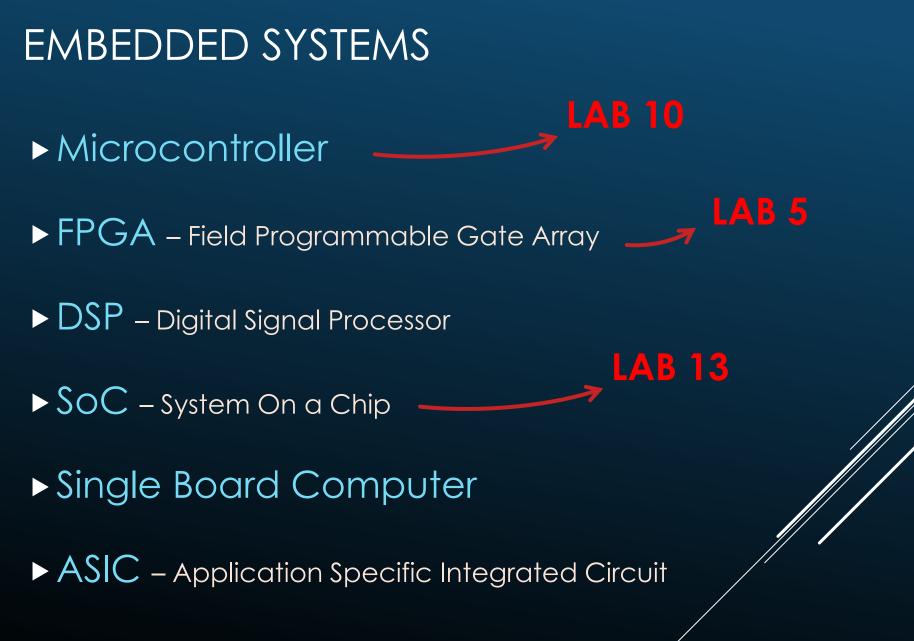

Is a microcontroller suitable for my application?

- ► Cost
- Development time
- Power consumption
- Processing power
- ► Timing requirements
- ► Etc.

USAGE OF MICROCONTROLLERS CHOOSING A MICROCONTROLLER

- What kind of problem do I have?
 - Processing intensive? Power limitation? Embedded?
- Which kind of sensors/actuators will be used?
 - Digital/Analog? Voltage levels?
- What are the required peripherals?
 - ► USB? I2C? ADCs? Timers?
- What is the environment?
 - Space? Right next to the LHC beam?
 - (Temperature, radiation, etc.)

Is it possible to build a complete particle detector and data acquisition system using Arduino microcontroller and Arduino Language ?

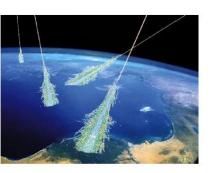

ArduSiPM a low cost particle detector

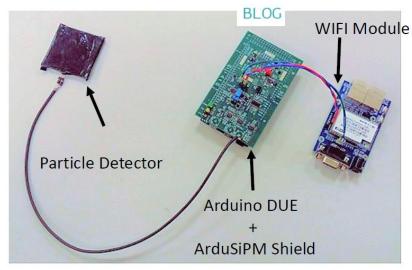

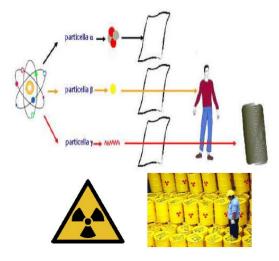

http://www.arduino.org/blog/ardusipm-solution

"The ambit of data acquisition for particle detection is a field apparently limited to top scientists from CERN in Geneva and Fermilab in Chicago. Cosmic ray and radiation detection can be a great exploration for teachers, students and science enthusiasts, and ArduSiPM was created to make it accessible."

Cosmic Ray detector

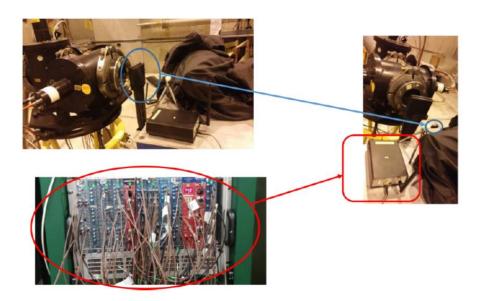

Application Example 2: Use of ArduSiPM in the CERN UA9 and CRYSBEAM activity

(substitute old Scintillator and electronics for PM)

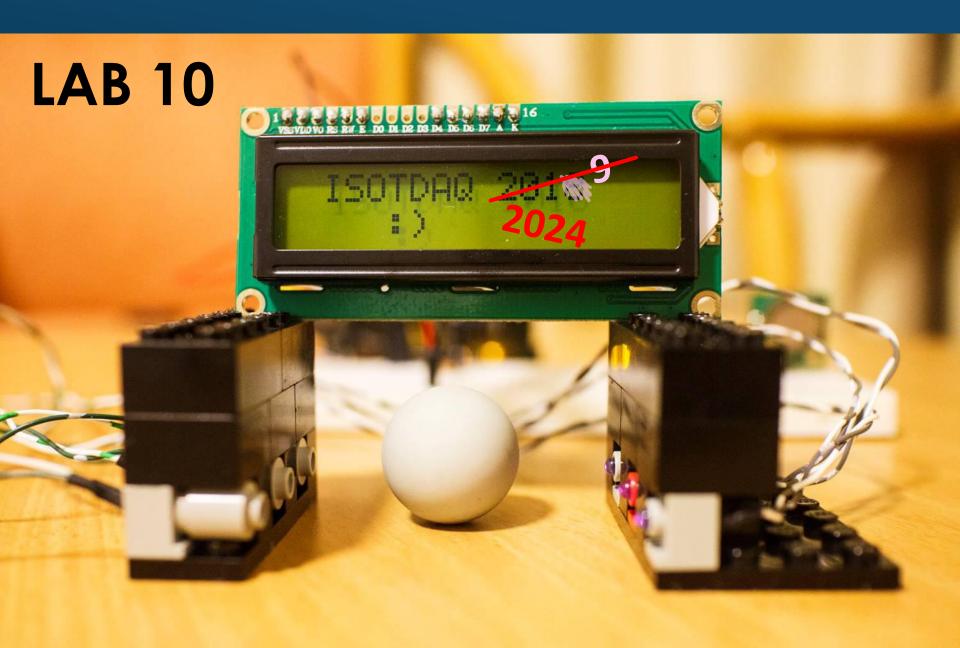

- As beam trigger @ extracted beam line H8 (CERN)

- As beam losses counter @ SPS

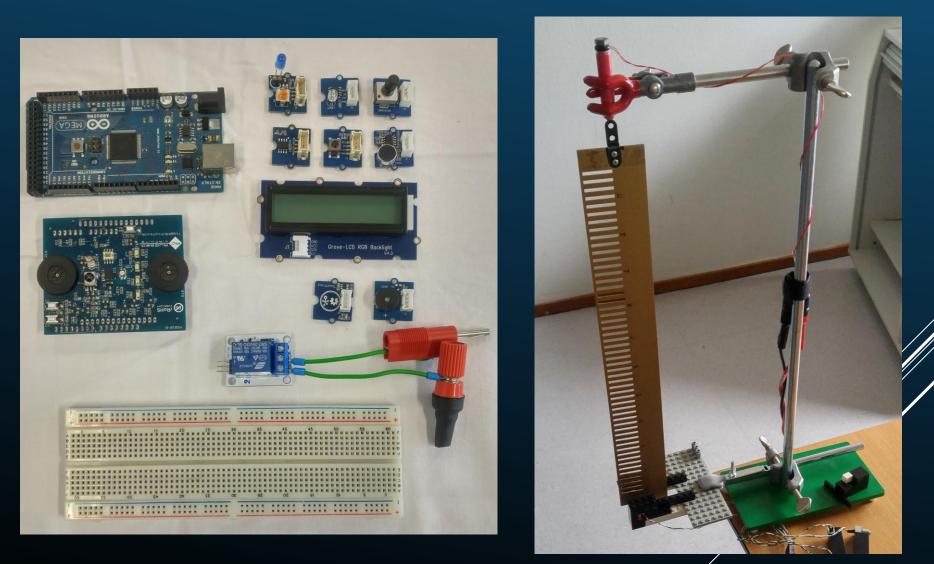

LAB 10 - MICROCONTROLLERS

THAT'S IT. OBRIGADO!

Maurício Féo m.feo@cern.ch

Features

- High performance, low power AVR[®] 8-bit microcontroller
- Advanced RISC architecture
 - 131 powerful instructions most single clock cycle execution
 - 32 × 8 general purpose working registers
 - Fully static operation
 - Up to 16MIPS throughput at 16MHz
 - On-chip 2-cycle multiplier

6.6 Instruction Execution Timing

This section describes the general access timing concepts for instruction execution. The AVR[®] CPU is driven by the CPU clock clk_{CPU} , directly generated from the selected clock source for the chip. No internal clock division is used.

Figure 6-4 shows the parallel instruction fetches and instruction executions enabled by the harvard architecture and the fast-access register file concept. This is the basic pipelining concept to obtain up to 1MIPS per MHz with the corresponding unique results for functions per cost, functions per clocks, and functions per power-unit.

Figure 6-4. The Parallel Instruction Fetches and Instruction Executions

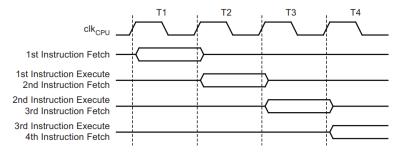

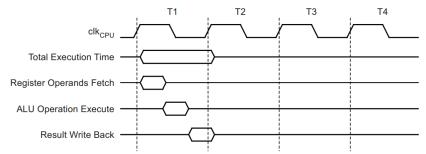

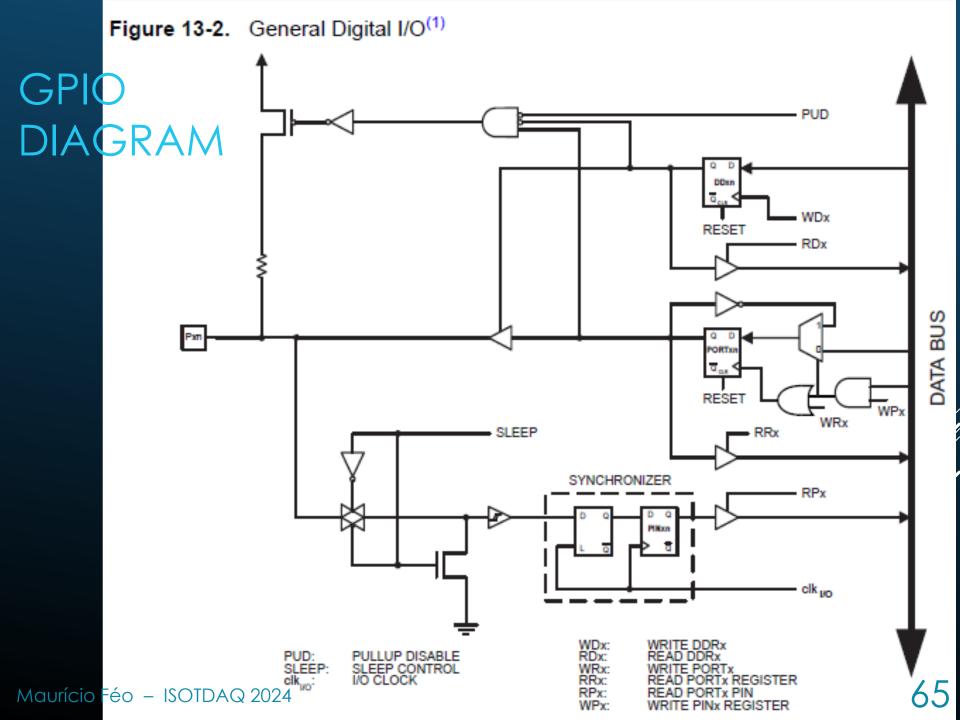

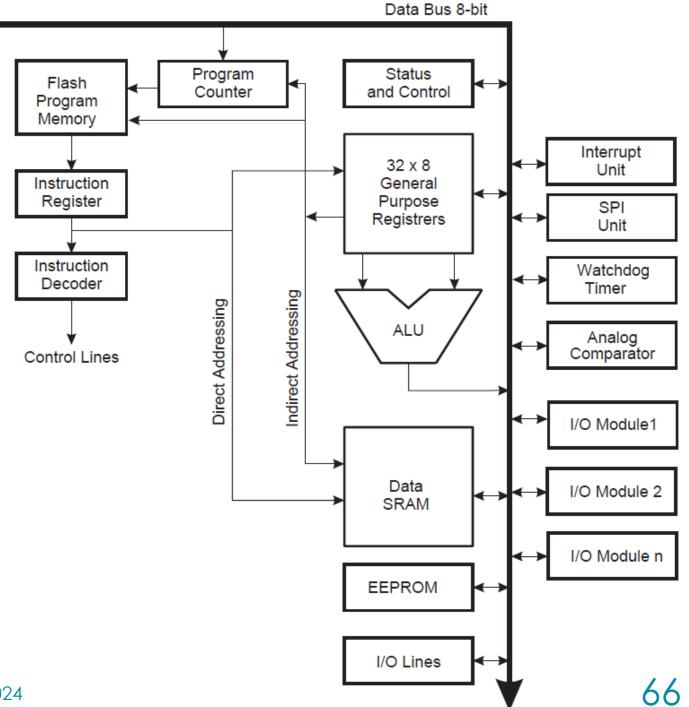

Figure 6-5 shows the internal timing concept for the register file. In a single clock cycle an ALU operation using two register operands is executed, and the result is stored back to the destination register.

Figure 6-5. Single Cycle ALU Operation
