## Application of quantum graph neural network on detector data

*Tuesday 22 October 2024 16:00 (15 minutes)*

We explore applications of quantum graph neural network(QGNN) on physics and non-physics data set. Based on a single quantum circuit architecture, we perform node, edge, and graph-level prediction tasks. Our main example is particle trajectory reconstruction starting from a set of detector data. Along with this, we expand our analysis on artificial helical trajectory data set. Finally, we will check how our quantum algorithm applies for non-physics data set as well by looking at Fingerprint data set in MUTAG, and AIDS data set, which collects molecular compounds graphs, focusing on graph-level task.
