Deployment of inference as a service at the US CMS Tier-2 data centers

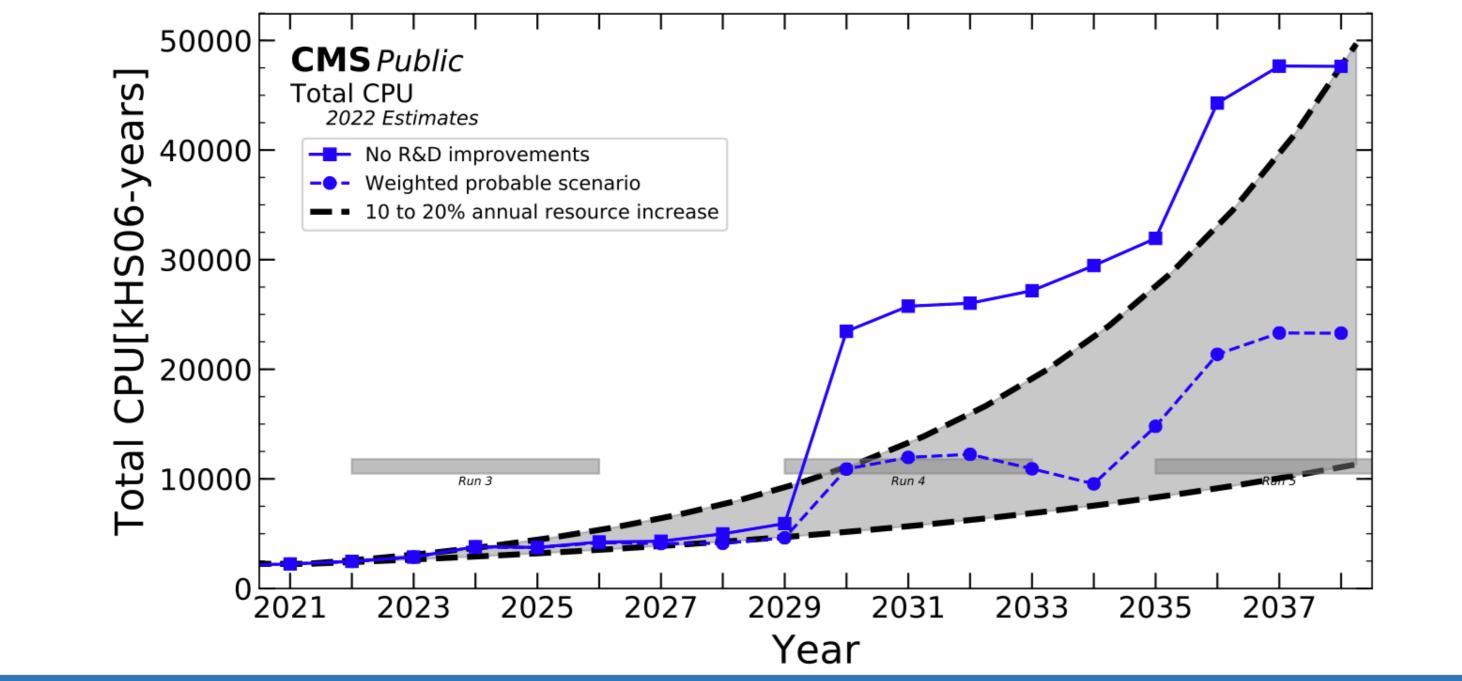

Burt Holzman, Kevin Pedro, Nhan Tran (FNAL); Philip Coleman Harris, Noah Paladino (MIT); Ethan Colbert, Dmitry Kondratyev, Miaoyuan Liu, Garyfallia Paspalaki, Stefan Piperov, Jan-Frederik Schulte, Yao Yao (Purdue); Javier Duarte (UCSD); Philip Chang, Kelci Ann Mohrman (UF); Yongbin Feng (TTU) on behalf of the CMS Collaboration

Computing Demands

• Large computing demands for HL-LHC, but CPU performance increases expected to be limited [1]

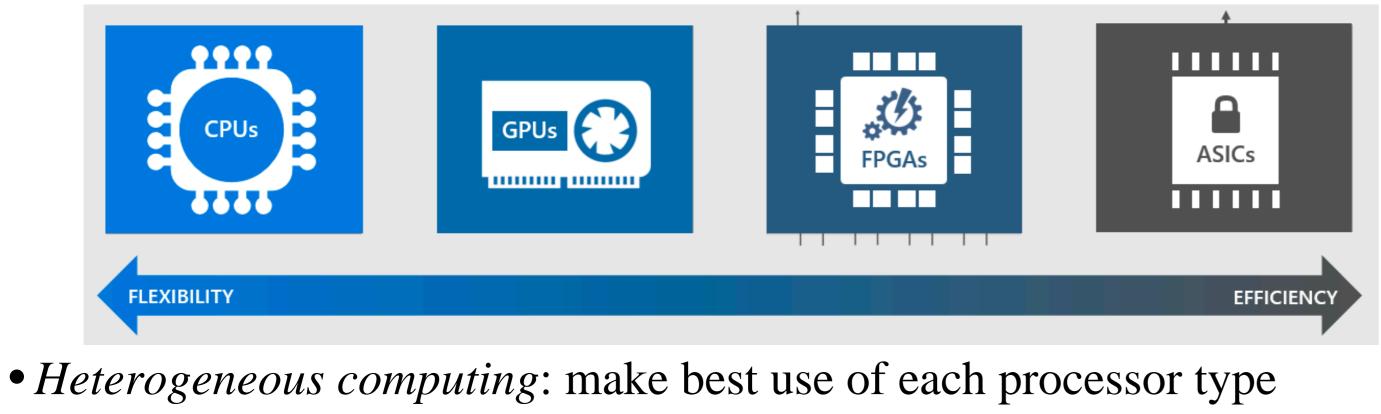

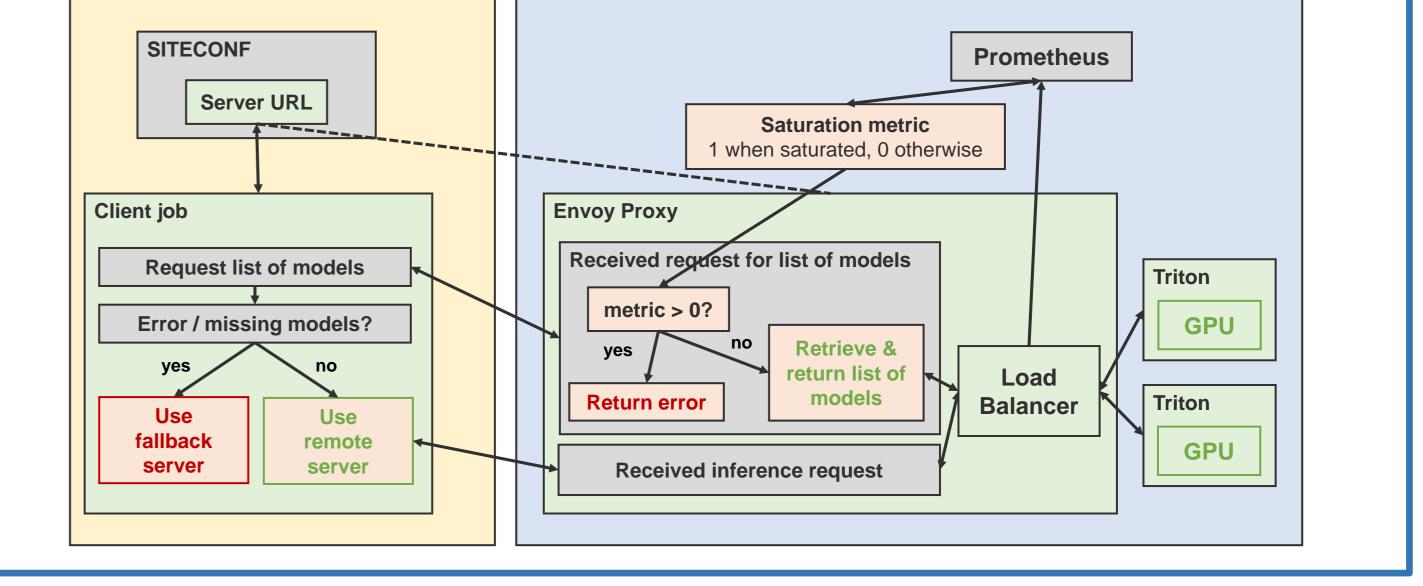

Architecture at Purdue T2

- Server discovery through official site configuration
- Prevent connections to saturated servers based on queue latency
- Load balancing via Envoy Proxy
- Autoscaling via KEDA (Kubernetes Event-Driven Autoscaling)
- Configuration bundled into Helm chart to deploy at other T2 sites

Coprocessors

- Recent performance improvements in coprocessors rather than CPUs
- Tradeoffs between flexibility and efficiency

Scaling and Load Balancing

GPU utilization per Triton server

Inference as a Service

• SONIC: Services for Optimized Network Inference on Coprocessors [2] O Design pattern for inference as a service in experiment software

- Build on industry technologies: gRPC, Nvidia Triton inference server
- Advantages:
- o *Isolation*: factorize ML frameworks out of experiment software
- *Simplicity*: client code only handles input/output conversions
- o *Flexibility*: CPU-GPU ratios can be adjusted dynamically
- o *Efficiency*: optimize CPU-GPU ratios to ensure full usage (minimizes cost)
- o *Portability*: use CPU, GPU, FPGA, etc. with no client-side code changes
- o Accessibility: use remote coprocessors if none available locally

FERMILAB-POSTER-24-0301-CMS-CSAID-PPD

CMS Simulation Preliminary Hammer cluster

SONIC (mean: 1.31) Fallback (mean: 0.90)

1.0

1.2

0.8

- Production-like "continuous flow" of jobs (13 TeV) (via CRAB): 1000 jobs in batches of 50, every 10 min
 - New load balancer distributes load *per* request: consistent and uniform load across GPUs for hours
- •45% speedup in Run 2 miniAOD workflow when offloading ML inference to GPUs vs. falling back to CPU-only processing 1.2 1.4 1.6 Event throughput [evt/s]

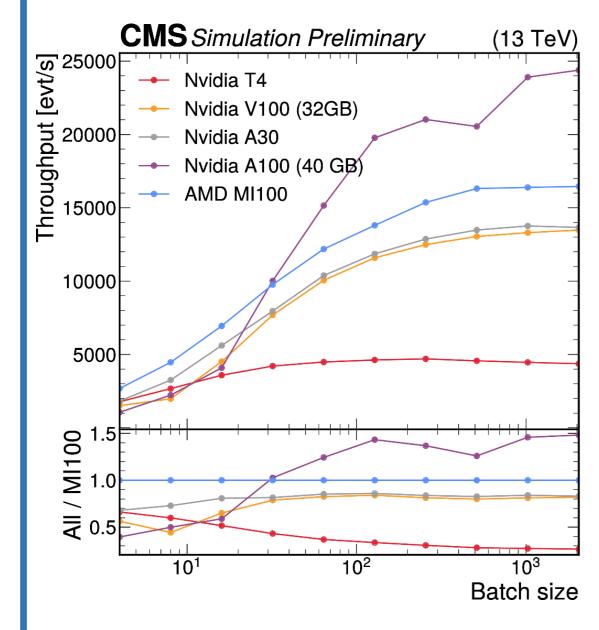

CMS Simulation Preliminary

o Depends on CPU properties

Run 3: Transformers

• CMS Run 3 miniAOD processing now includes Particle Transformer (ParT) [4], successor to ParticleNet

AMD GPUs

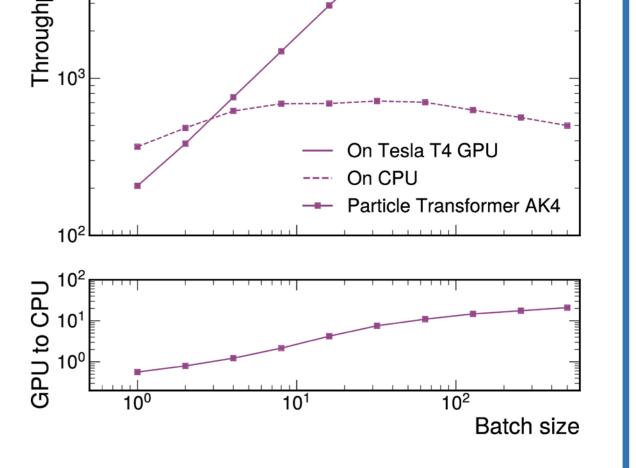

• First demonstration of non-Nvidia GPU usage, using important CMS ParticleNet [3] algorithm

• AMD MI100 has superior throughput to several existing GPU types (even A100s at smaller batch sizes)

• AMD GPUs can be accessed through the Triton server using a custom backend: dedicated instructions loaded by server via Python (or compiled into shared library)

- Factor 10 speedup demonstrates advantages of batching
- o Dynamic batching (combining requests from different threads/jobs) only possible via SONIC/Triton!
- Overall miniAOD workflow speedup: 33% w/ ParT on GPU through SONIC

(13.6 TeV)
