

Lattice and Effective Field Theory for Hard Probes

Hai-Tao Shu

Central China Normal University

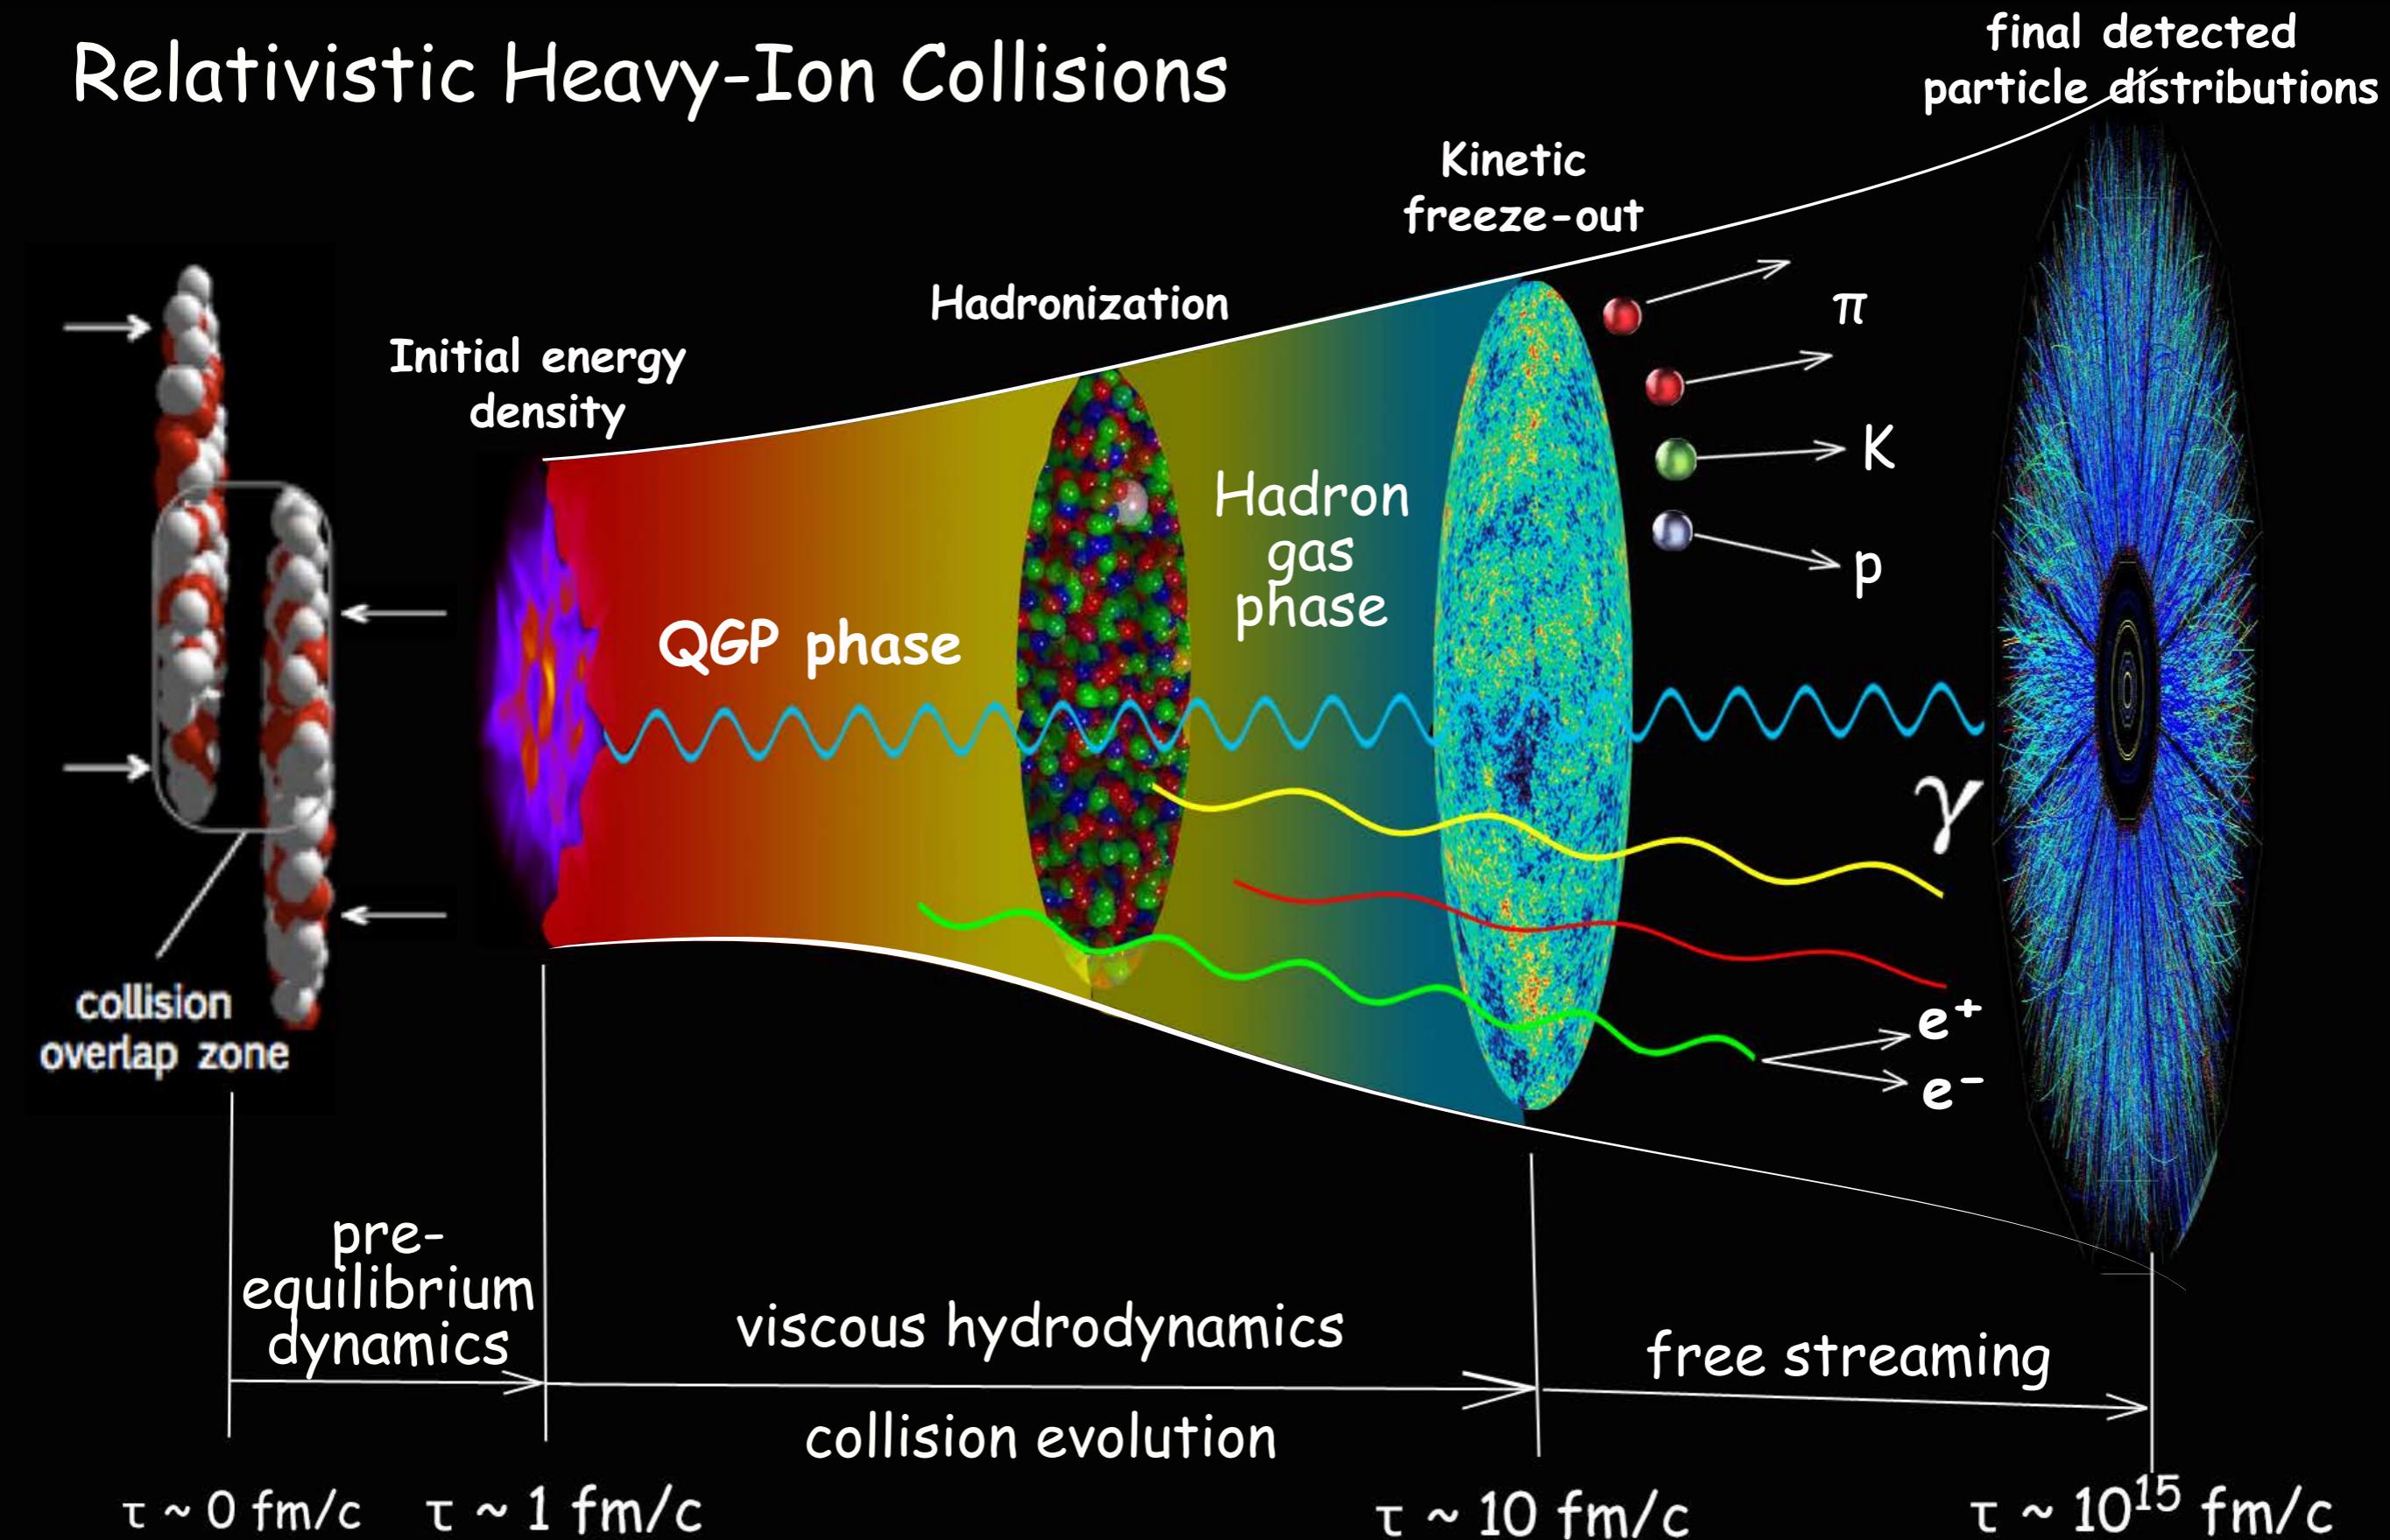

Hard Probe 2024

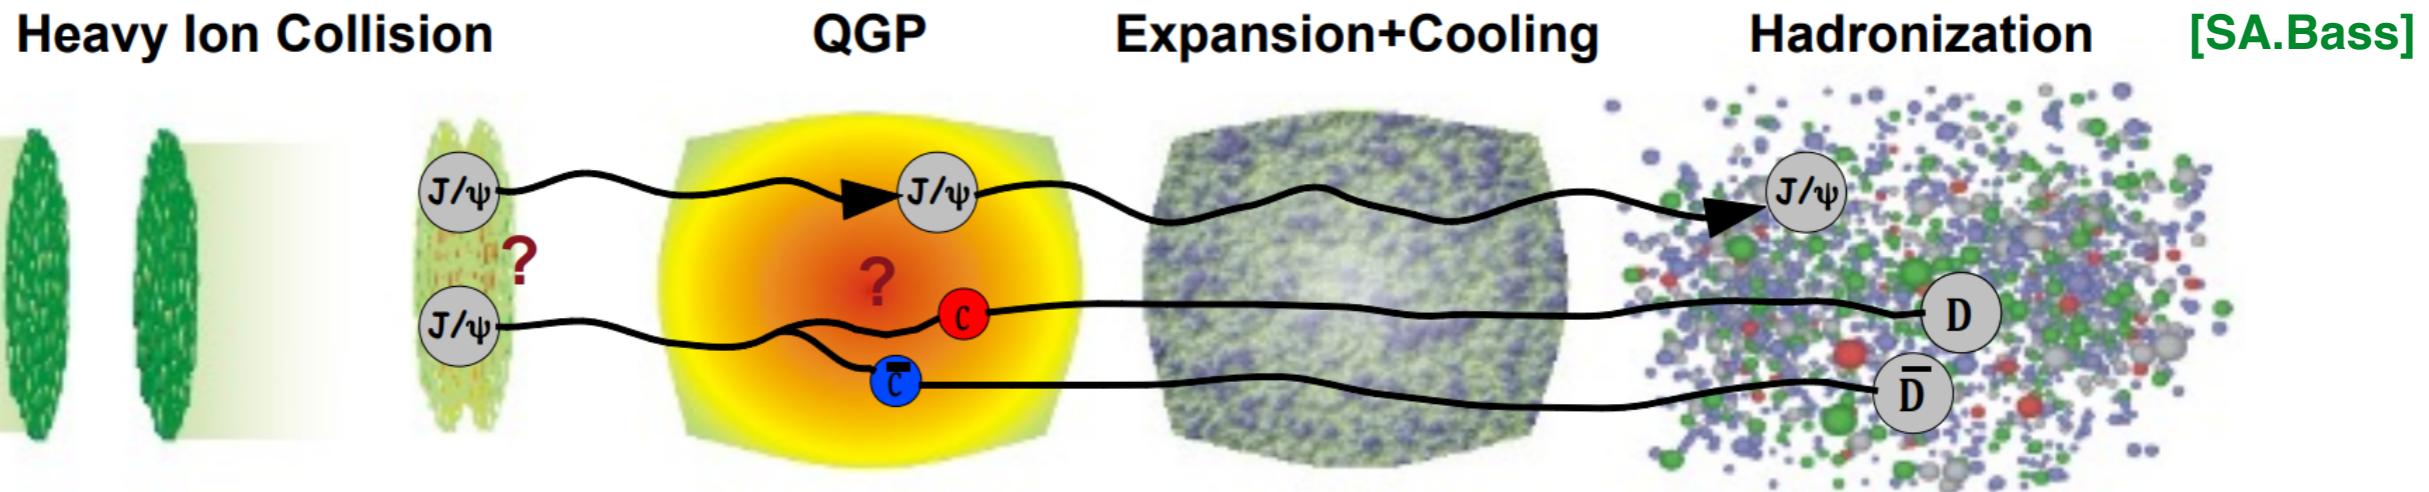

Sep. 22 - Sep. 27, 2024, Nagasaki, Japan

Heavy-ion collisions at LHC and RHIC

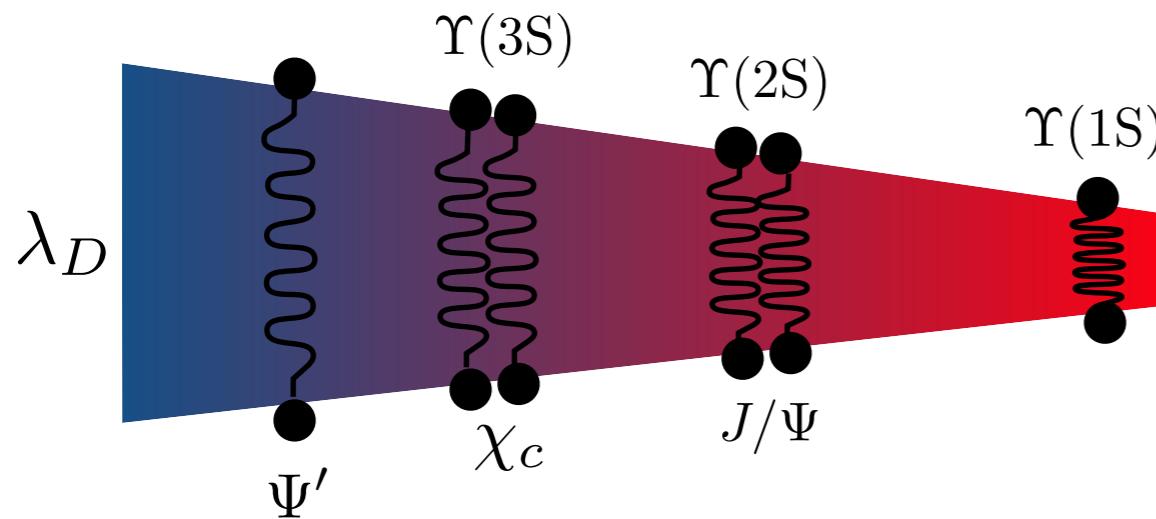

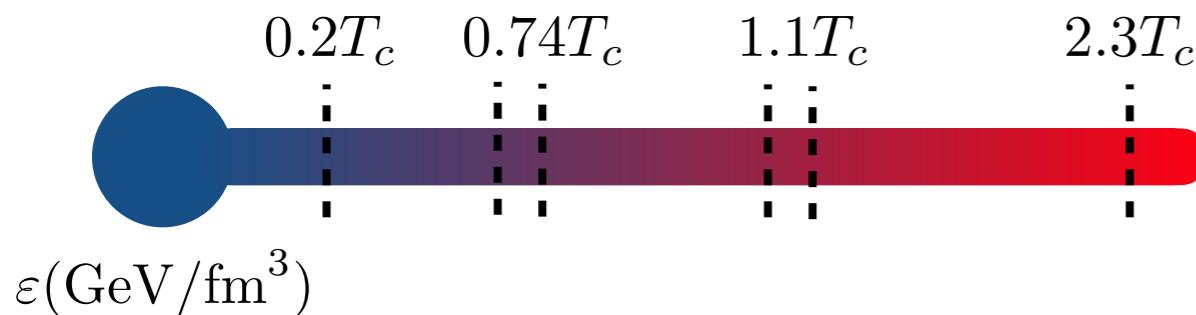

Relativistic Heavy-Ion Collisions

Heavy flavor probes

Probe the hot medium with different length scales

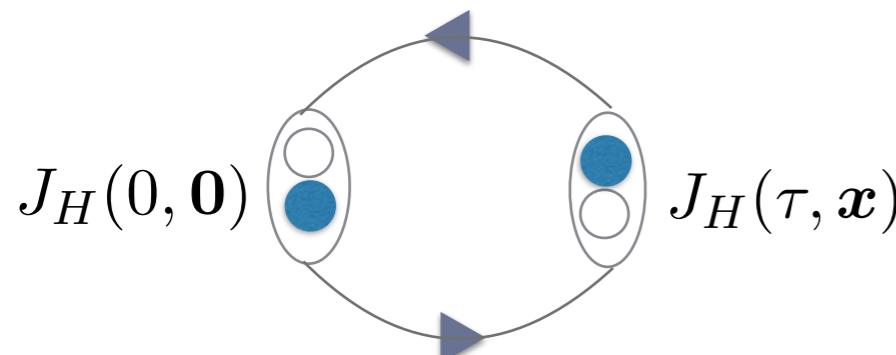

Where Lattice and EFT can help ...

- In-medium quarkonium properties: masses, widths, melting T
- Complex quark-antiquark potential: $\text{Re}[V], \text{Im}[V]$
- Heavy quark diffusion: D_s

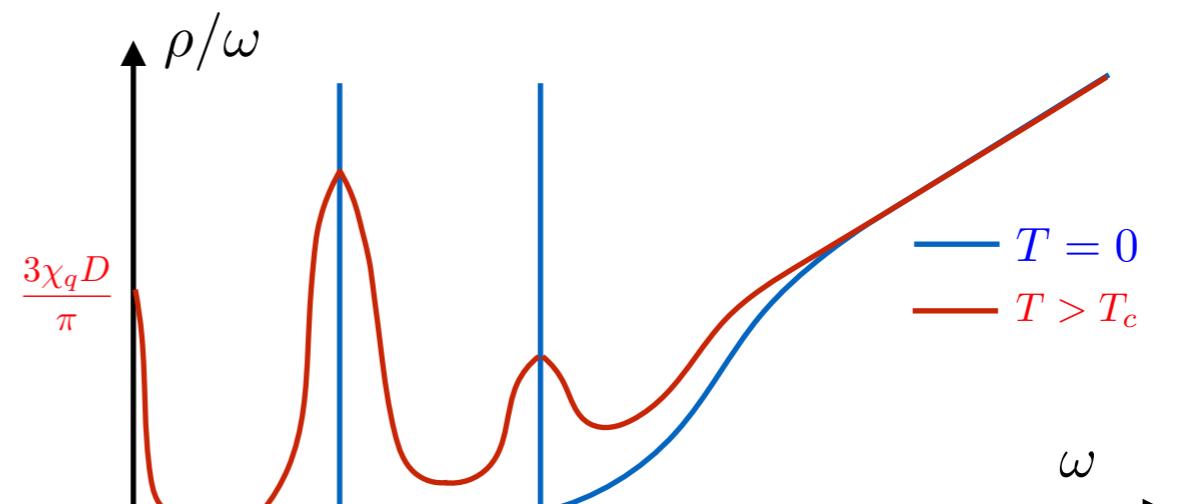

2015 Long Run Plan Nuclear Science

From Imag.-time lattice to real-time physics

An example: meson spectral function

$$G_H(\tau, \vec{p}) = \sum_{x,y,z} \exp(-i \vec{p} \cdot \vec{x}) \langle J_H(0, \vec{0}) J_H^\dagger(\tau, \vec{x}) \rangle = \int \frac{d\omega}{2\pi} \frac{\cosh(\omega(\tau T - 1/2)/T)}{\sinh(\omega/2T)} \rho_H(\omega, \vec{p}, T)$$

$$K(\omega, \tau, T)$$

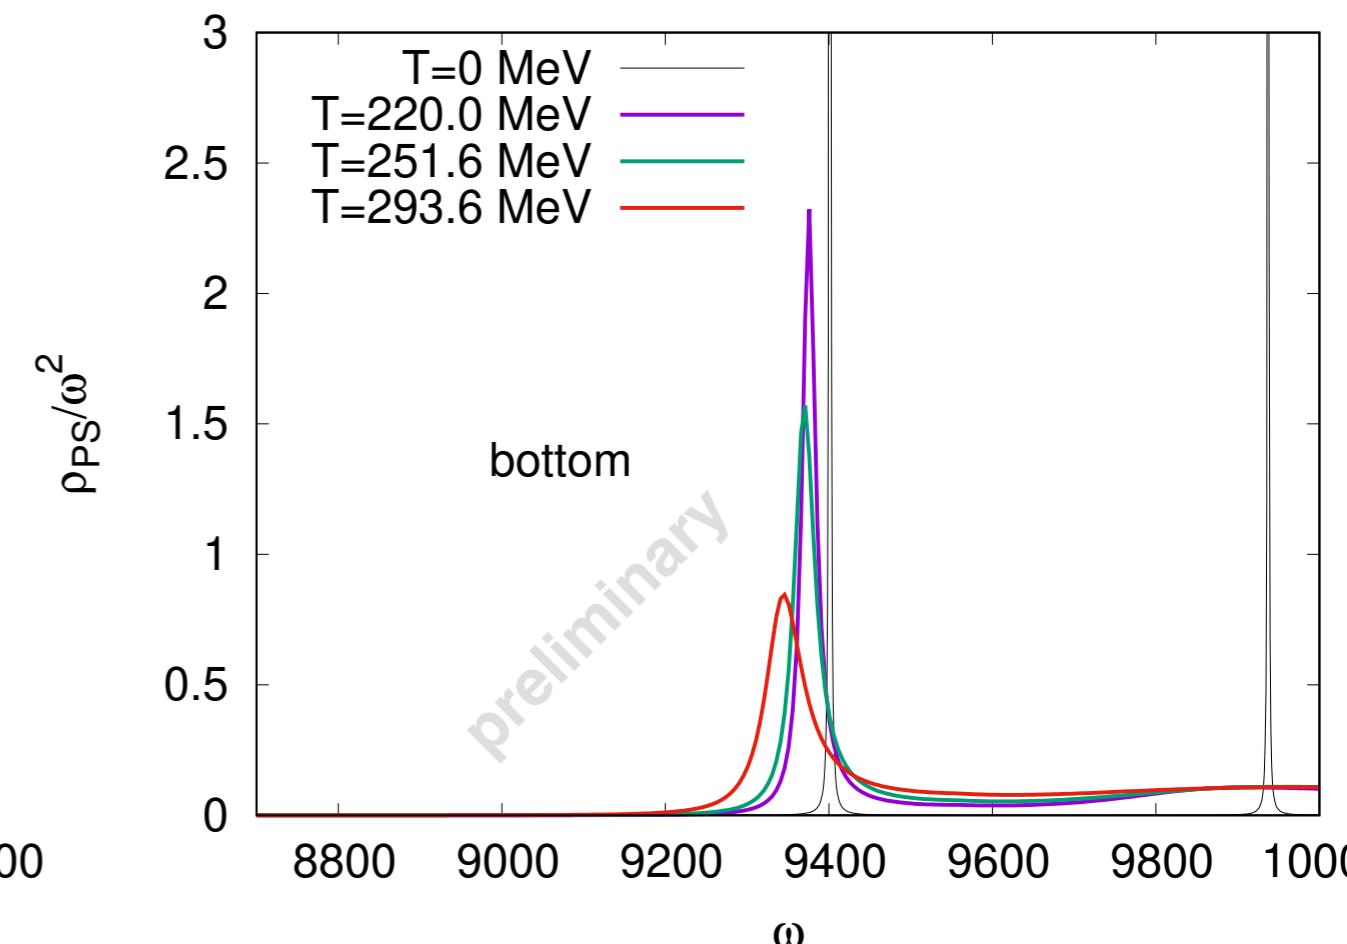

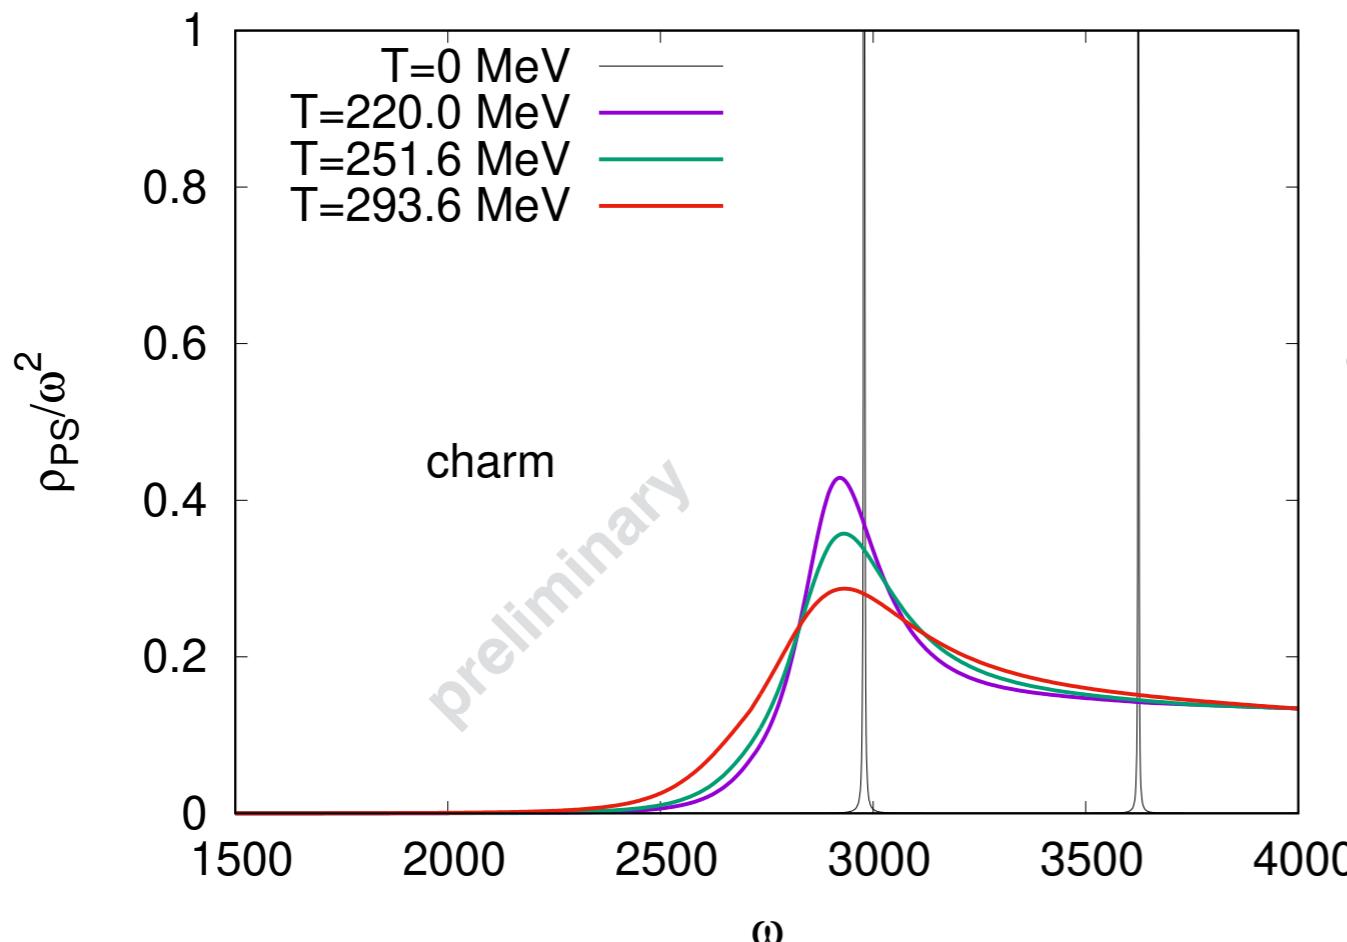

- Meson spectral function tells melting temperature and heavy quark diffusion

Quarkonium spectral function (relativistic HQ)

Need very fine and large lattice for heavy quark $T = 1/(aN_\tau)$

First full QCD calculation with relativistic heavy quarks

[hotQCD, Few Body Syst. 64(2023) 3, 52]
[S. Ali, D. Bala, et al., in prep.]

- Thermal broadening for both charm and bottom
- More broadening for charm than bottom
- Determination of dissociation temperature needs more investigation

Non-relativistic heavy quark

NRQCD becomes possible due to scale separation: $m_Q \gg m_Q v \gg m_Q v^2$

~~m_Q : hard scale, quark creation and annihilation~~

$m_Q v$: soft scale, momentum exchange between $Q\bar{Q}$

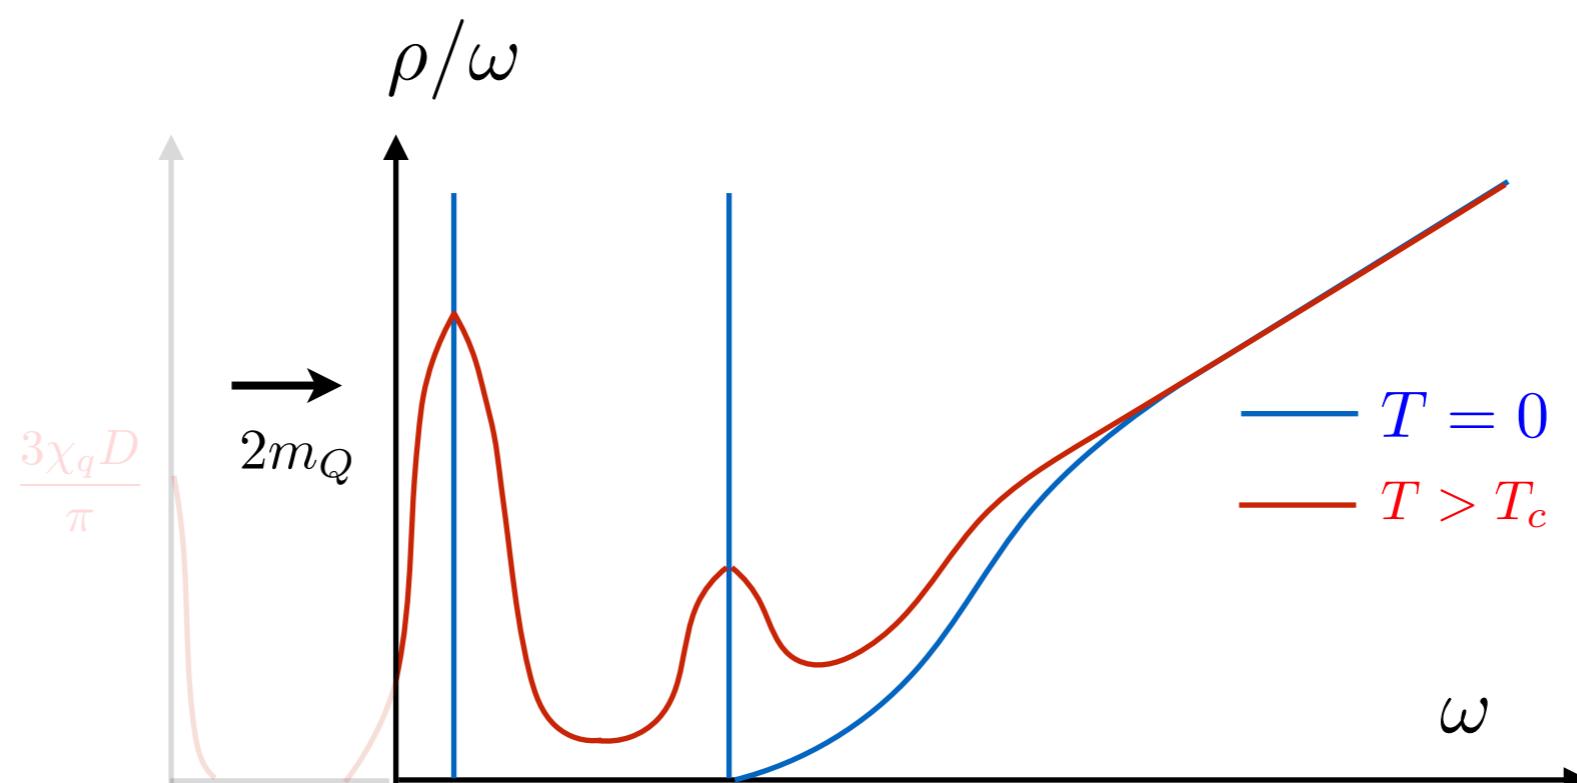

$m_Q v^2$: ultrasoft scale, binding/melting of $Q\bar{Q}$

G. Aarts, et al., JHEP 07 (2014) 097

S. Kim, et al., JHEP 11 (2018) 088

R. Larsen, et al., PRD 100 (2019) 7, 074506

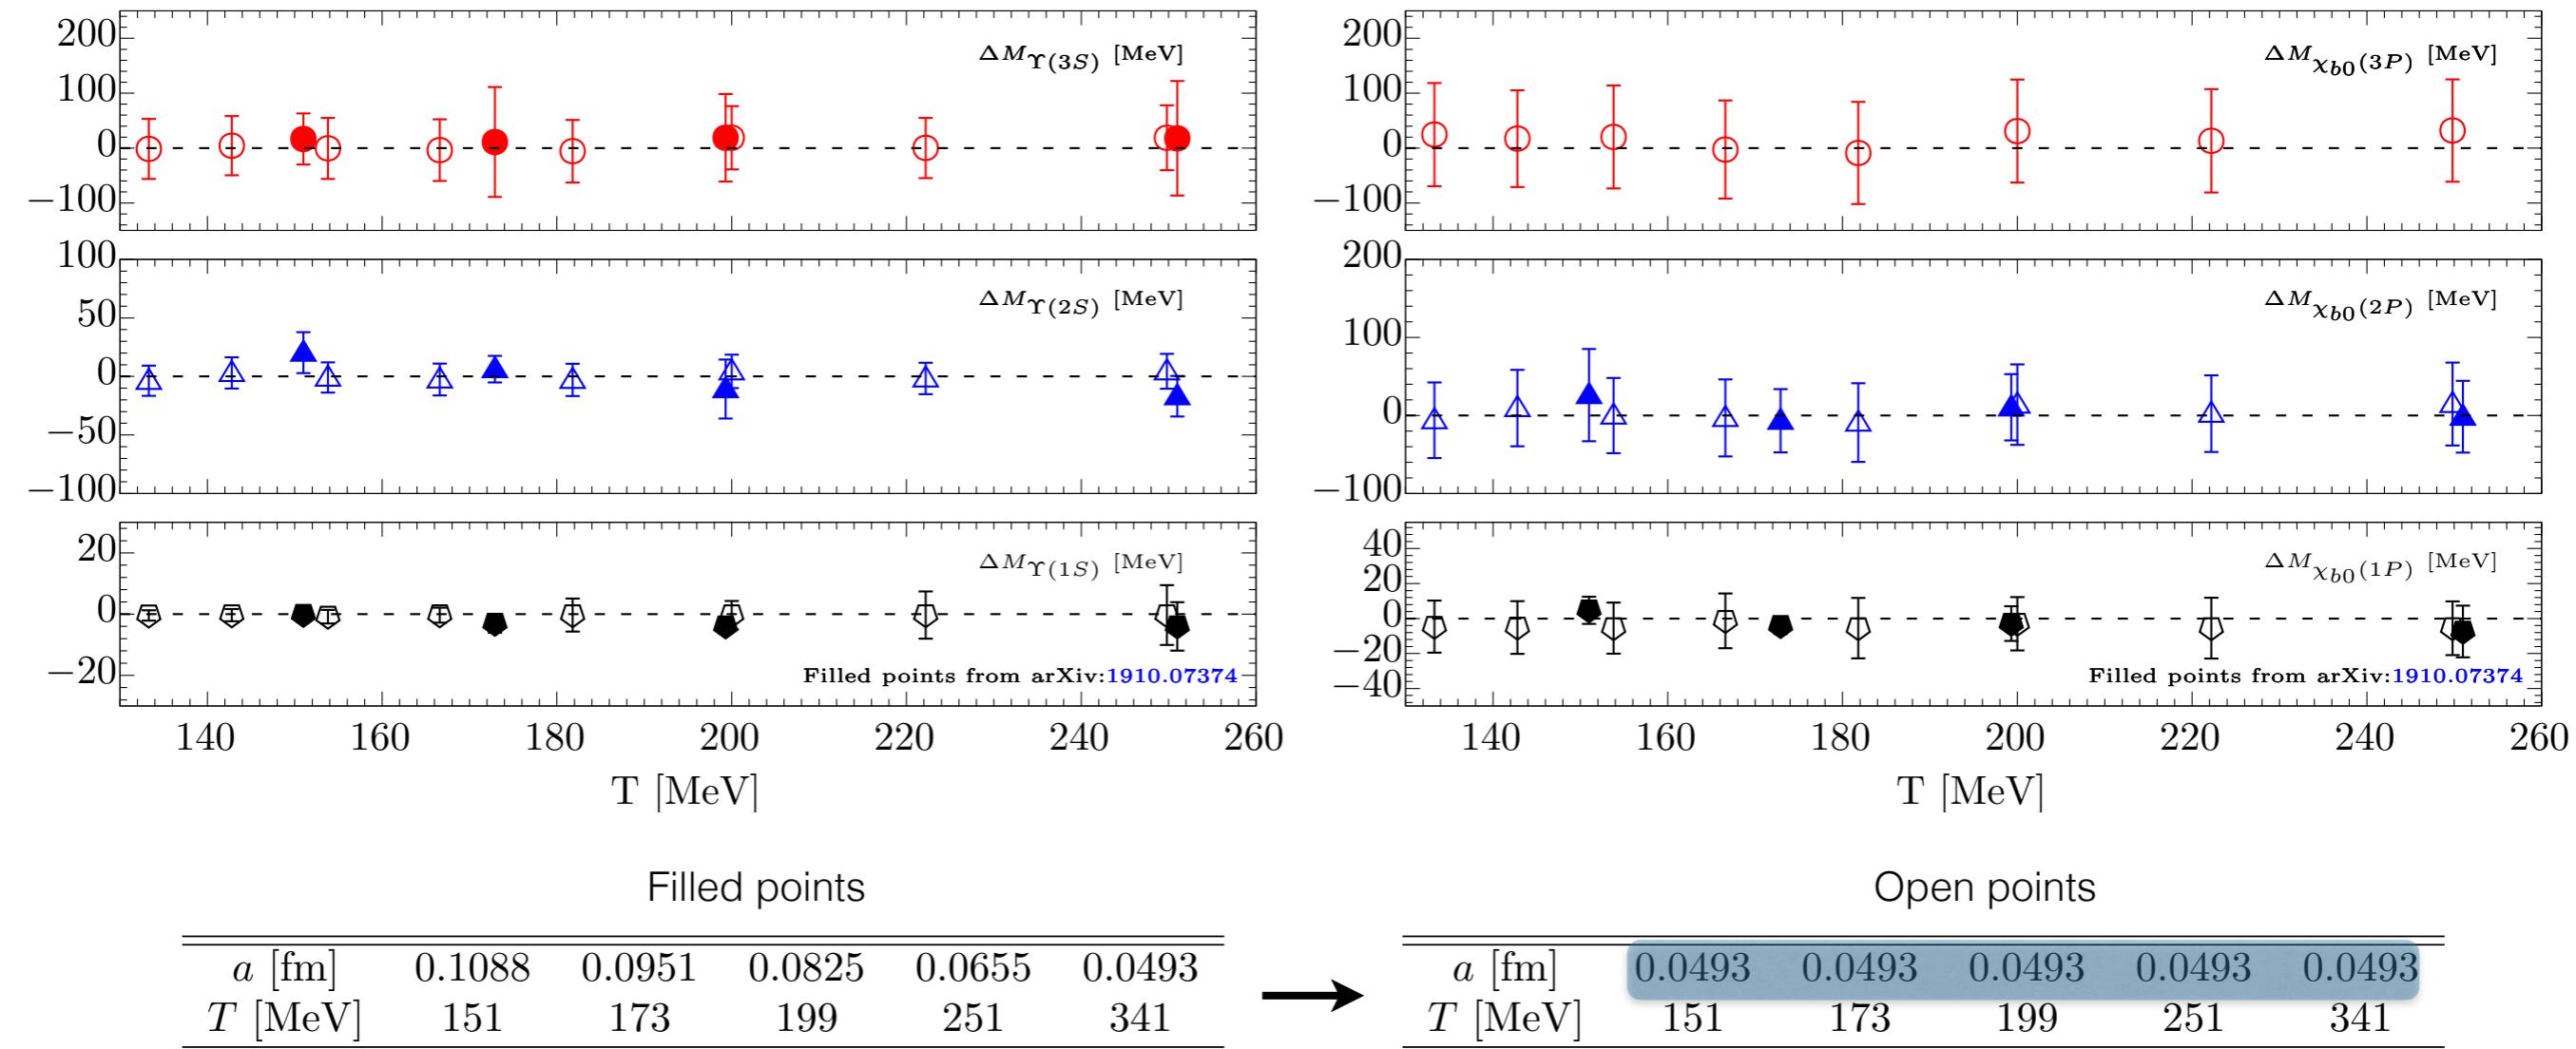

R. Larsen, et al., PLB 800 (2020) 135119

Quarkonium correlators can be computed with better resolution!

Mass shift of bottomonium from NRQCD

Model spectra: $\rho_\alpha^{\text{med}}(\omega, T) = A_\alpha^{\text{cut}}(T) \delta(\omega - \omega_\alpha^{\text{cut}}(T)) + A_\alpha(T) \exp\left(-\frac{[\omega - M_\alpha(T)]^2}{2\Gamma_\alpha^2(T)}\right)$

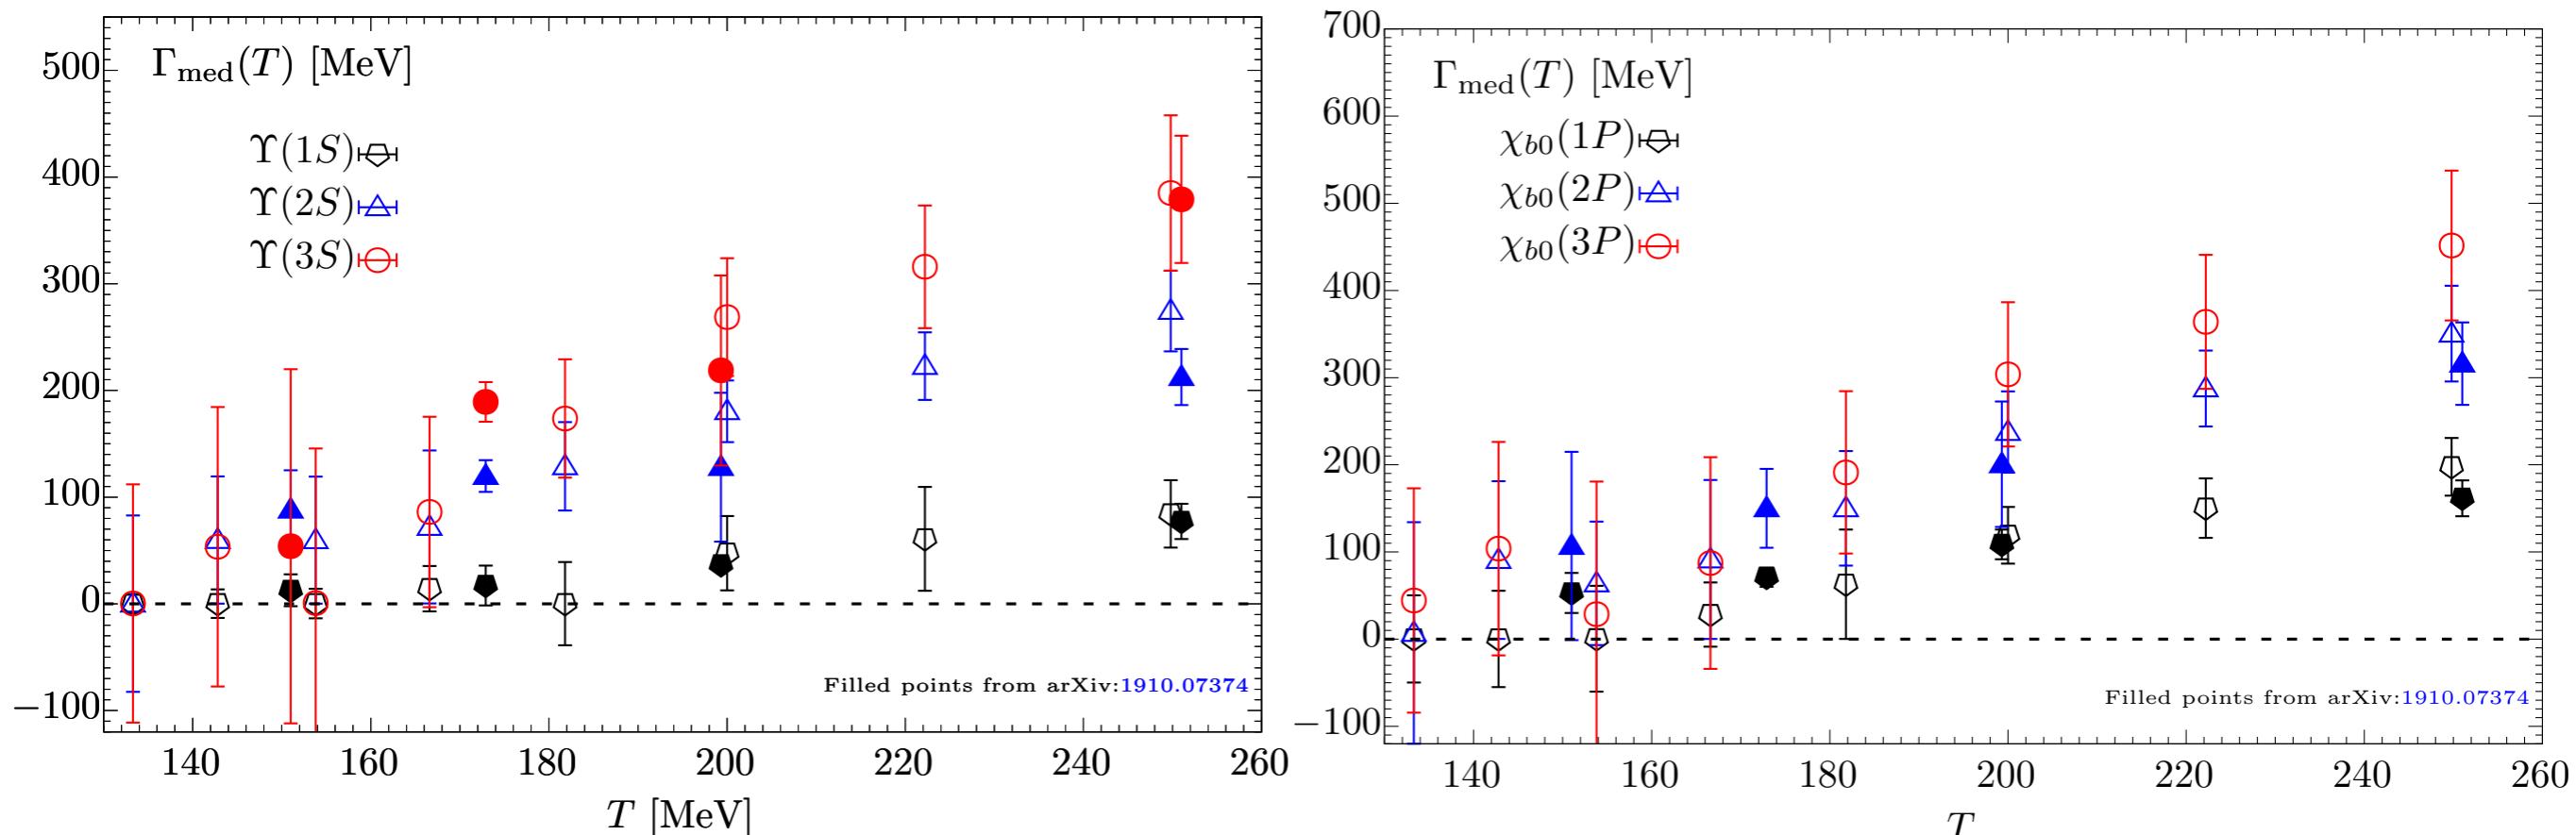

R. Larsen, et al., PLB 800 (2020) 135119

Wei-Ping Huang, talk @ Lattice 2024

- No mass shift for all states

Thermal width of bottomonium from NRQCD

R. Larsen, et al., PLB 800 (2020) 135119 & Wei-Ping Huang, talk @ Lattice 2024

- Increasing thermal width with temperature for all states
- Thermal broadening follows the hierarchical increasing pattern

Static quark potential

- Hard Thermal Loop resummed perturbation theory

M. Laine, JHEP0703,054 (2007)

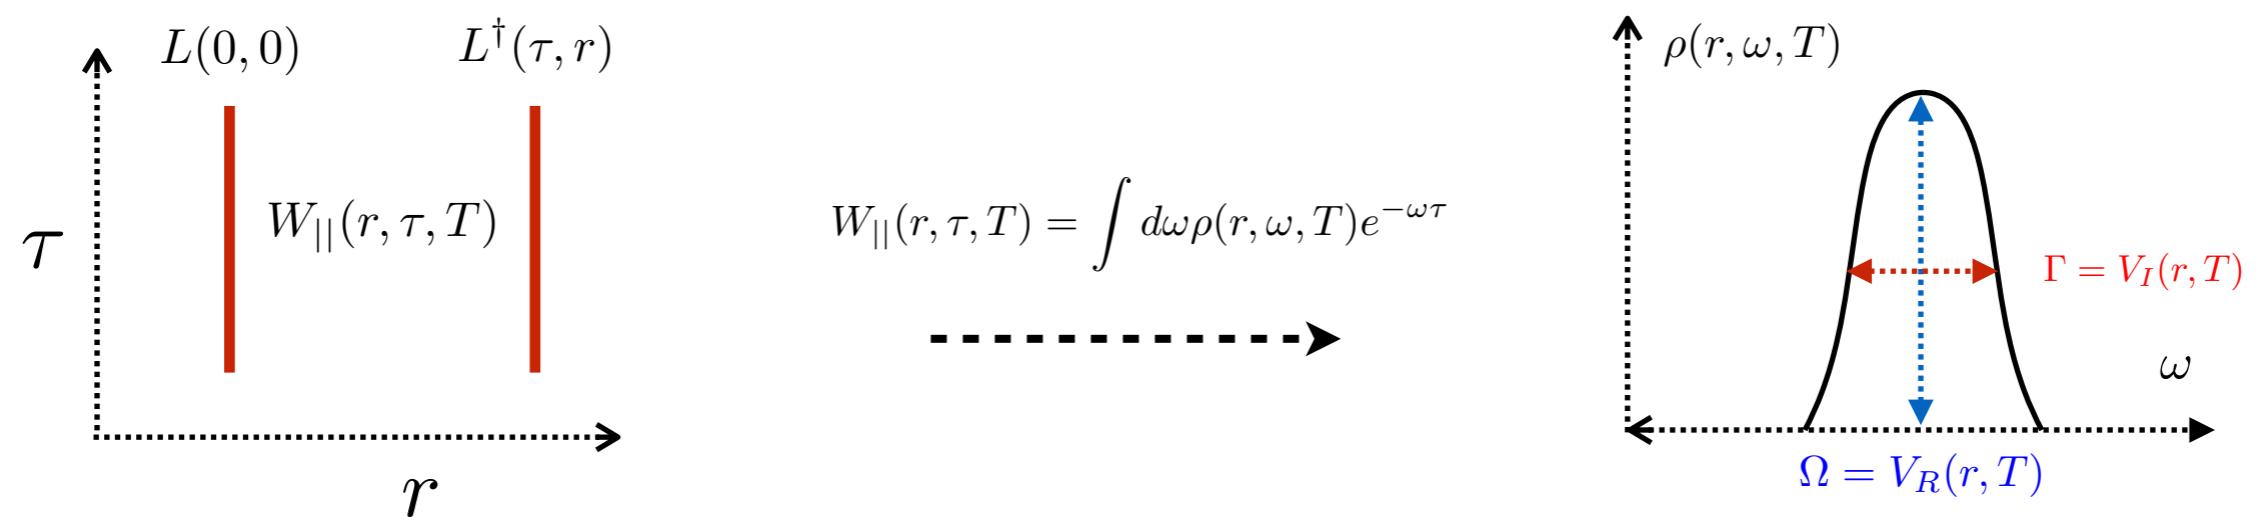

$$\lim_{t \rightarrow \infty} V_>^{(2)}(t, r) = -\frac{g^2 C_F}{4\pi} \left[m_D + \frac{\exp(-m_D r)}{r} \right] - \frac{ig^2 T C_F}{4\pi} \phi(m_D r)$$

Imaginary part becomes important for physical bottomonium at $T > 250$ MeV!

- Non-perturbative determination matters at around and above T_c

Wilson loop/thermal Wilson line correlators in Coulomb gauge

A. Rothkopf et al., PRL. 108 (2012) 162001

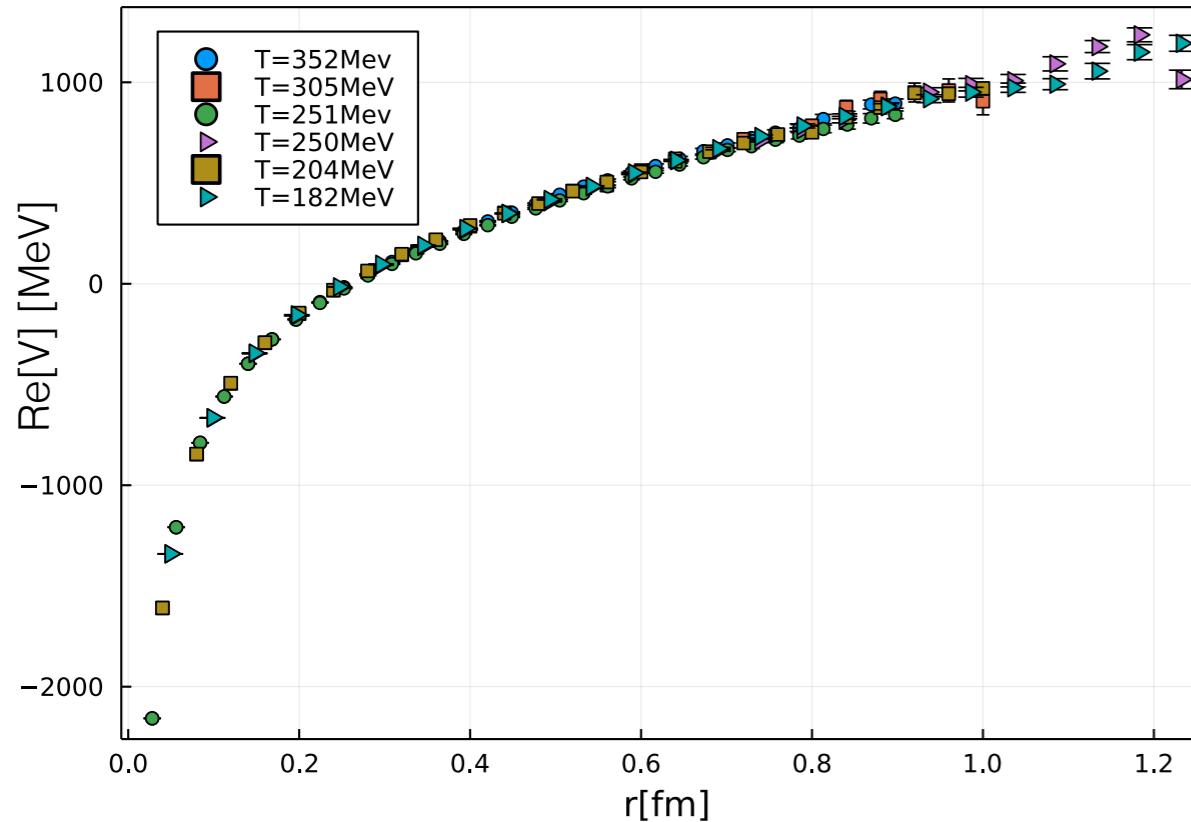

- Subtract continuum contribution from zero temperature correlators
- Model the potential as arguments of spectral function

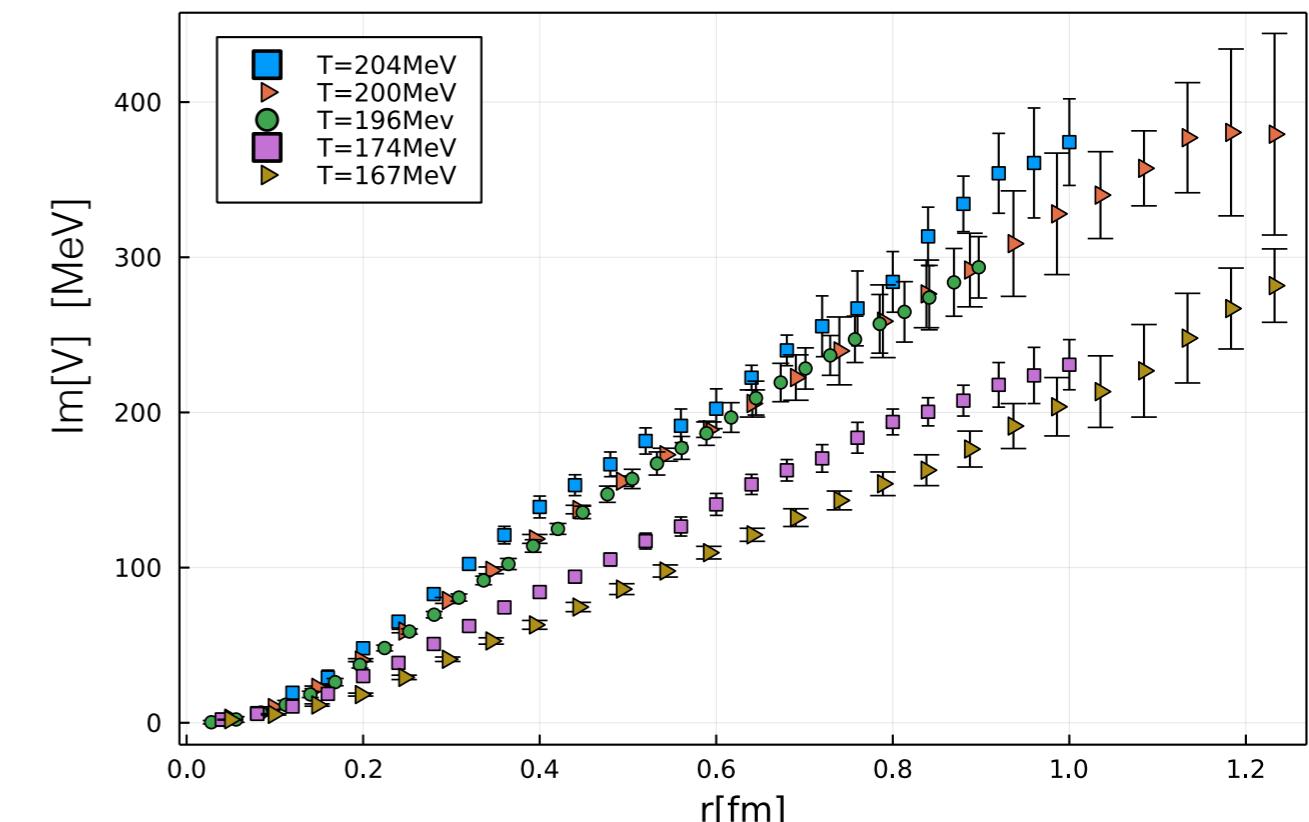

Static quark potential in hot QCD

$$N_f = 2 + 1, m_\pi = 160 \text{ MeV}, a \rightarrow 0$$

Real part: temperature insensitive

Imag. part: increasing with T & r

[HotQCD, PRD 109 (2024) 7, 074504]

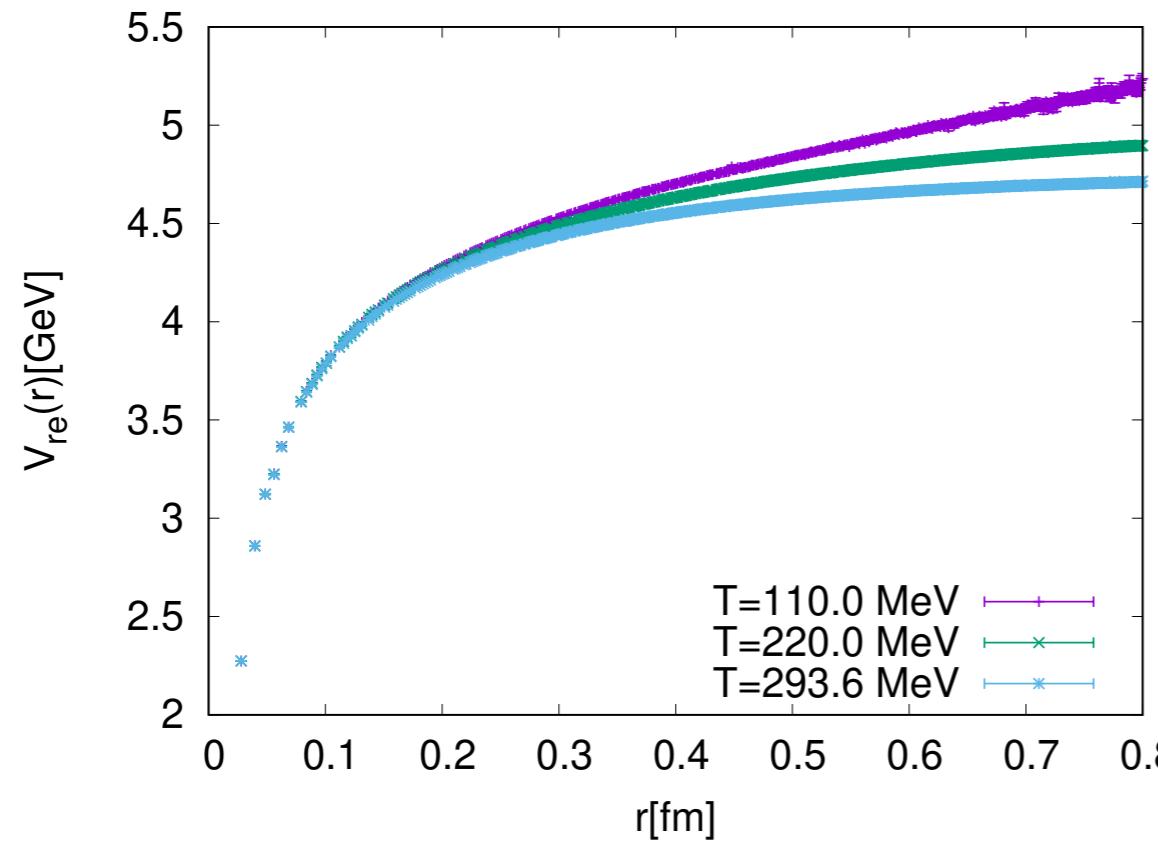

$$\rho(r, \omega) = \frac{1}{\pi} \text{Im} \frac{A(T)}{\omega - \text{Re}V(r, T) - i\Gamma(\omega, r, T)}$$

- No color screening from cut-Lorentzian model SPF (no mass shift for bottomonium)

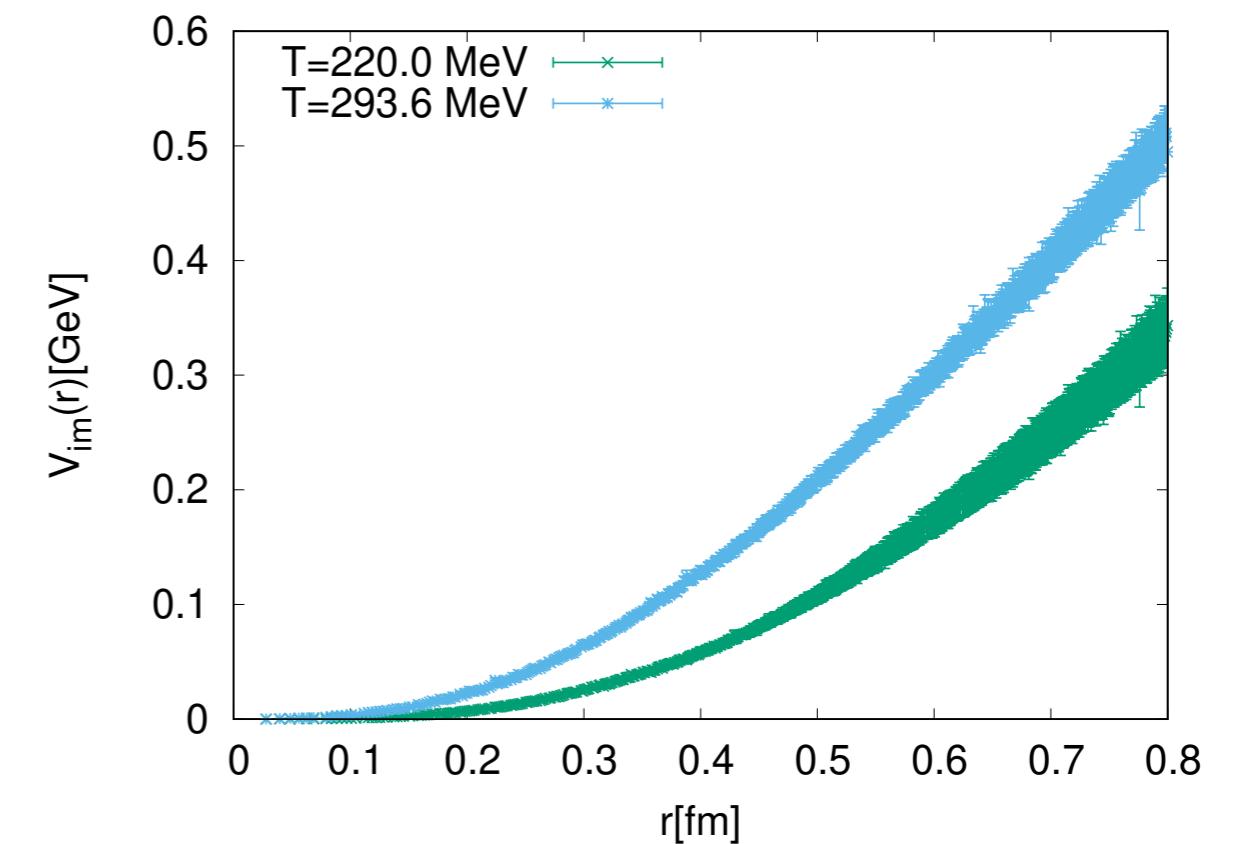

Static quark potential in hot QCD

$$N_f = 2 + 1, m_\pi = 160 \text{ MeV}, a \rightarrow 0$$

Real part: temperature sensitive

Imag. part: increasing with T & r

[Dibyendu Bala, et al, in prep.]

$$\rho(r, \omega) = n_b(\omega) \left(c_{-1}/\omega + \sum_{l=0}^{\infty} c_{2l+1} \omega^{2l+1} \right)$$

- Color screening evident from HTL-inspired model SPF

Heavy quark diffusion via HQEFT

- Langevin equations of heavy quark motion

$$\partial_t p_i = -\eta_D p_i + \xi_i(t) \quad \langle \xi_i(t) \xi_j(t') \rangle = \kappa \delta_{ij} \delta(t - t')$$

- Mass dependent **momentum** diffusion coefficient

$$\kappa^{(M)} \equiv \frac{M^2 \omega^2}{3T \chi_q} \sum_i \frac{2T \rho_V^{ii}(\omega)}{\omega} \Big|_{\eta \ll |\omega| \lesssim \omega_{\text{UV}}}$$

- Large quark mass limit in HQ effective field theory

$$\kappa \equiv \frac{\beta}{3} \sum_{i=1}^3 \lim_{\omega \rightarrow 0} \left[\lim_{M \rightarrow \infty} \frac{M^2}{\chi_q} \int_{-\infty}^{\infty} dt e^{i\omega(t-t')} \int d^3 \vec{x} \left\langle \frac{1}{2} \{ \mathcal{F}^i(t, \vec{x}), \mathcal{F}^i(0, \vec{0}) \} \right\rangle \right]$$

J. Casalderrey-Solana and D. Teaney, PRD 74, 085012

S. Caron-Huot et al., JHEP 0904 (2009) 053

A. Bouttefoux, M. Laine, JHEP 12 (2020) 150

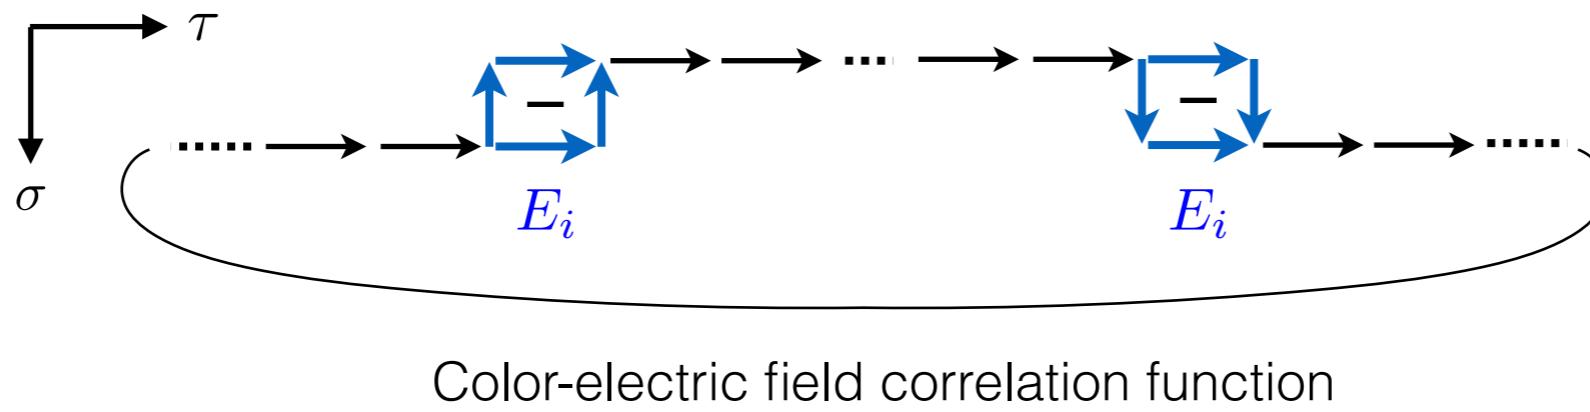

$$\partial_t \mathbf{p} = q(\mathbf{E} + \mathbf{v} \times \mathbf{B}) = \mathbf{F}$$

Momentum diffusion on the lattice

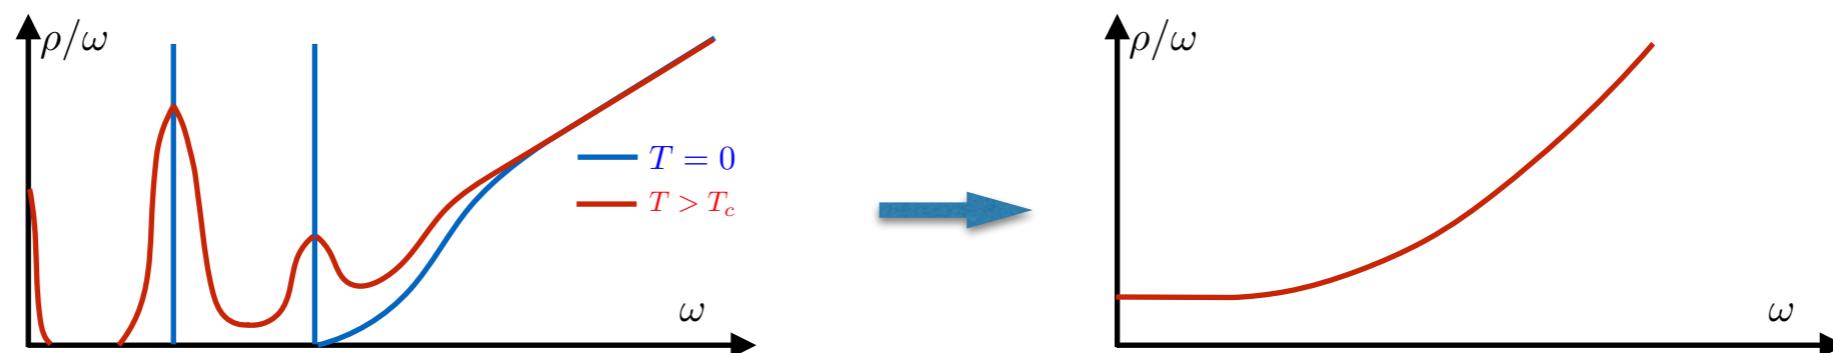

$$\kappa = \kappa_E + \frac{2}{3} \langle \mathbf{v}^2 \rangle \kappa_B$$

$$\langle \mathbf{v}^2 \rangle = \frac{3T}{M}$$

$$\frac{1}{2\pi T D} = \frac{\kappa}{4\pi T^3} = \frac{1}{2\pi T^2} \lim_{\omega \rightarrow 0} \frac{\rho(\omega)}{\omega}$$

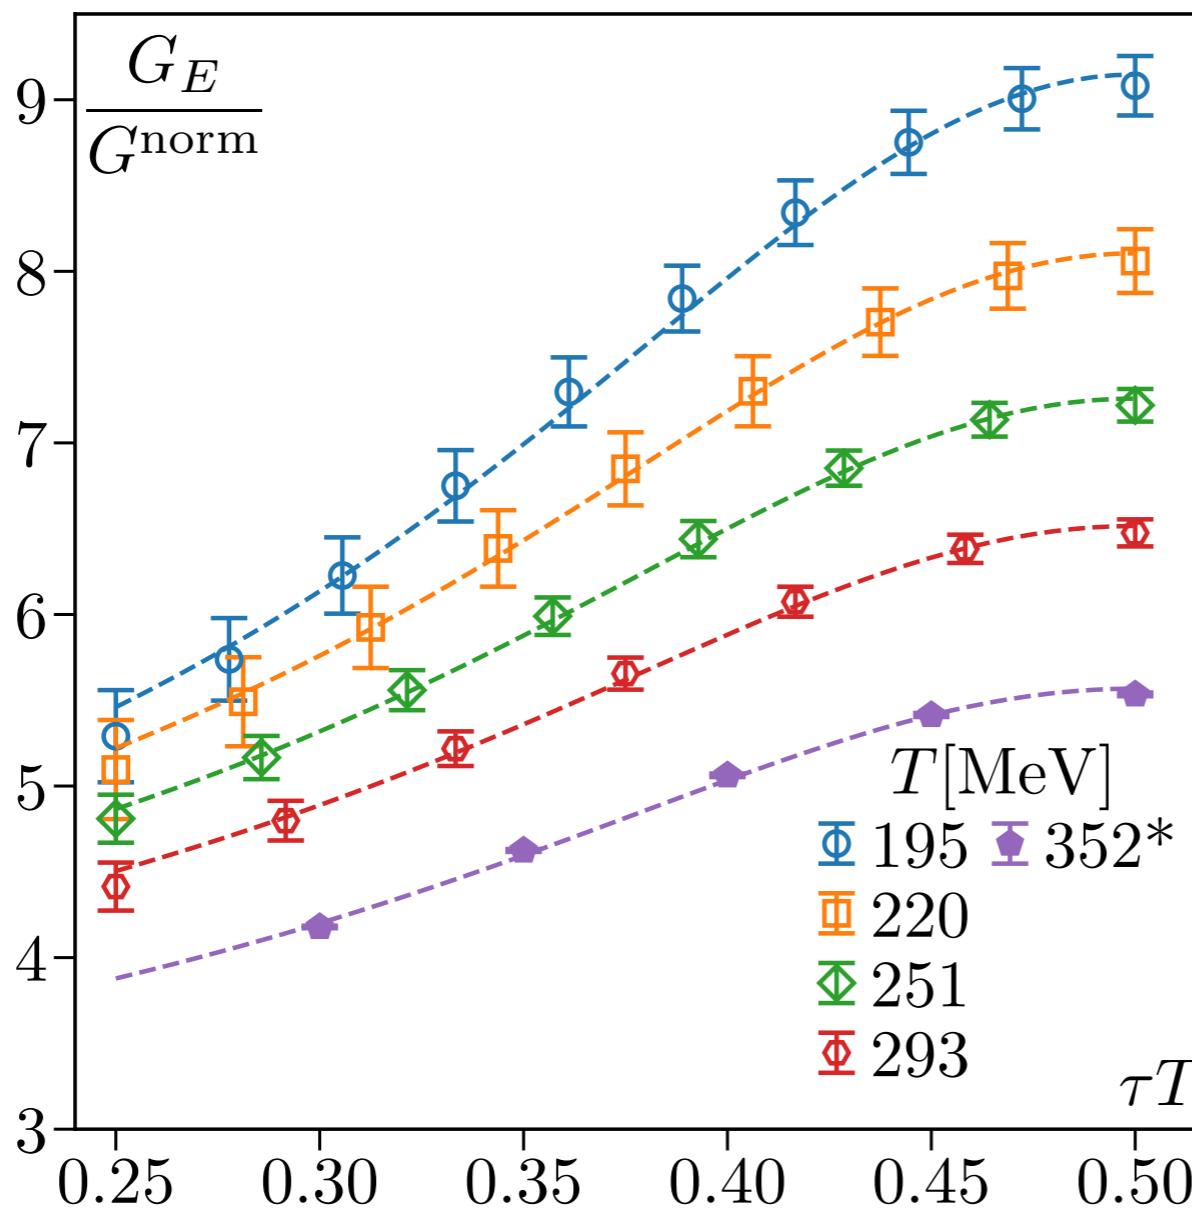

$$G(\tau, T) = \int \frac{d\omega}{\pi} K(\omega, \tau, T) \rho(\omega, T)$$

- Cheaper to measure on the lattice
- No peak structures in spectral functions
- Absence of transport peak

First full QCD calculation of EE correlators

First full QCD calculation of κ , only possible via Gradient Flow!

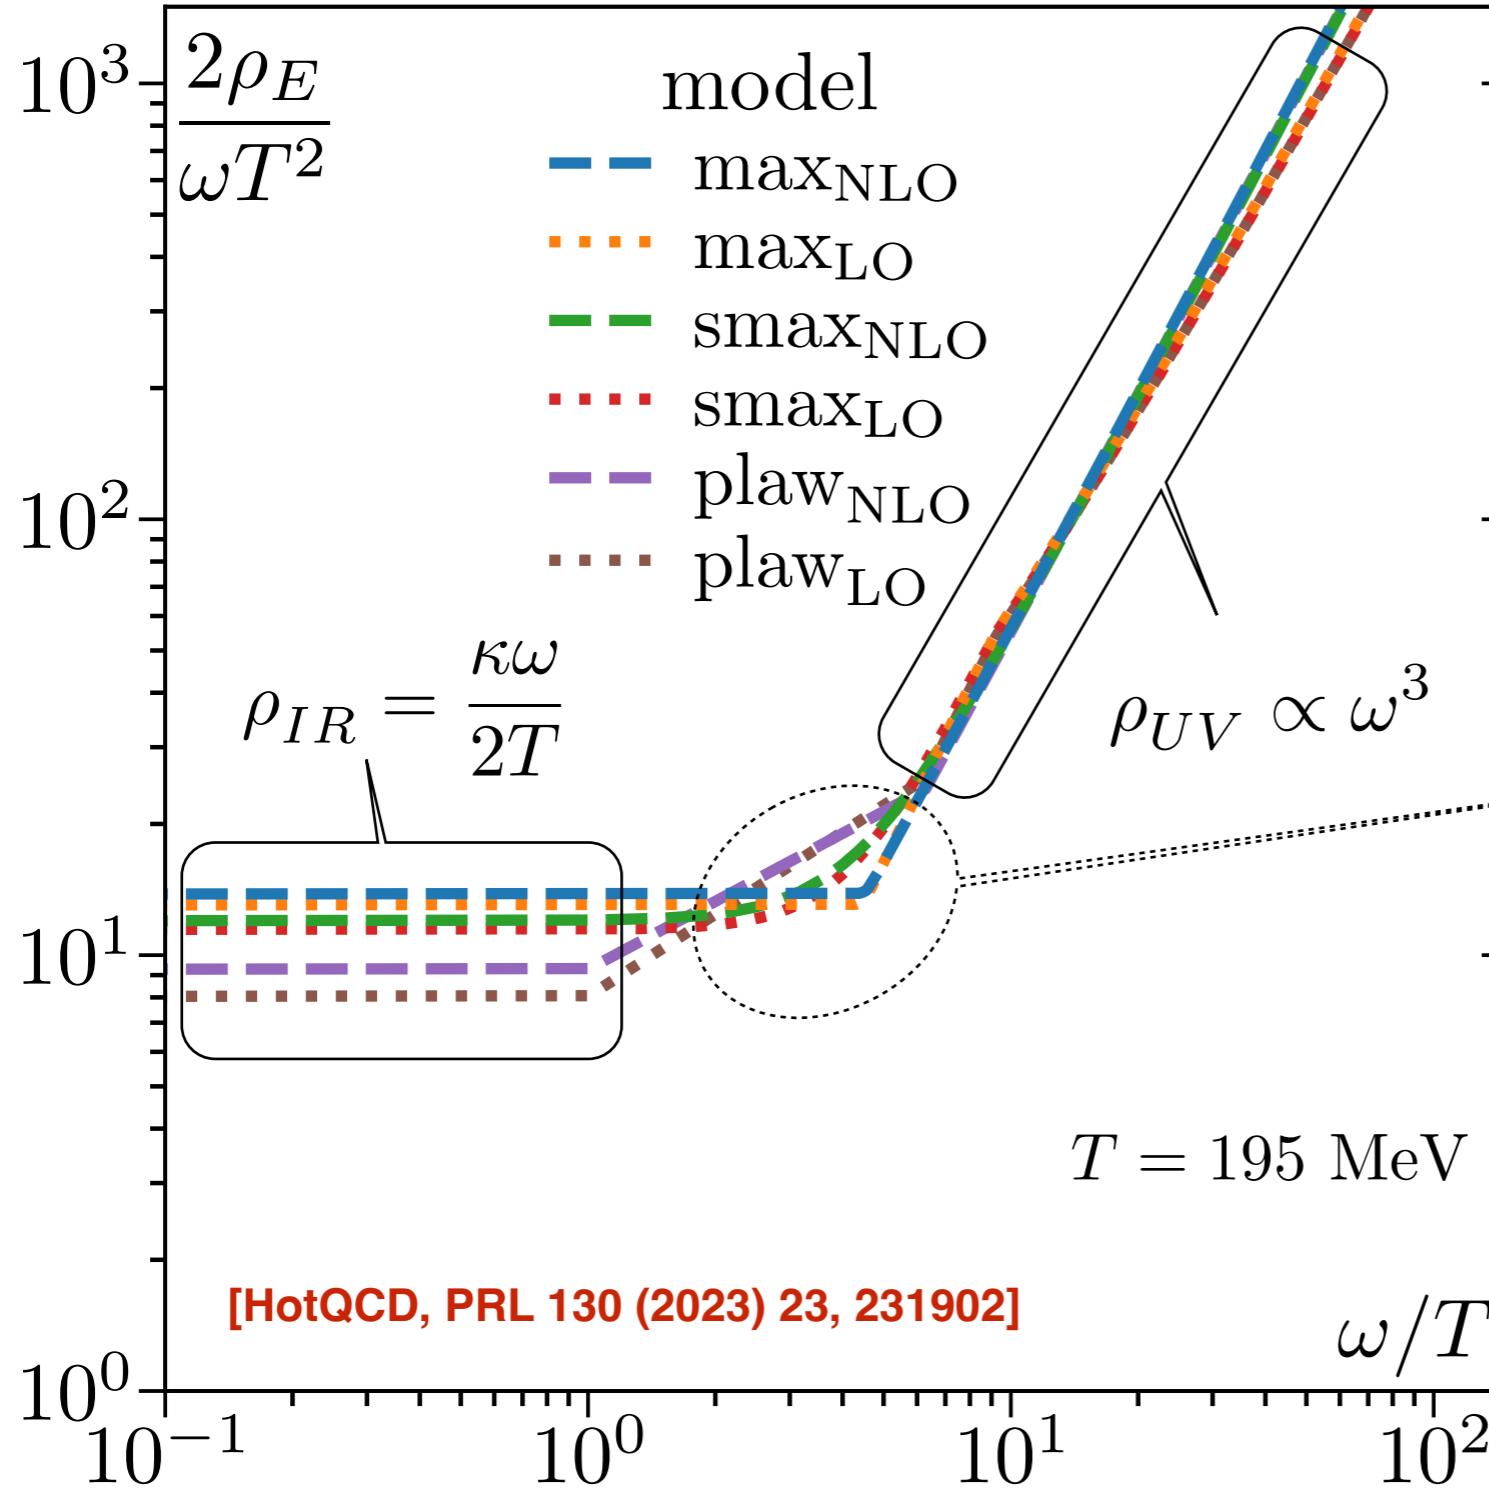

Luscher & Weisz, JHEP1102(2011)051
Narayanan & Neuberger, JHEP0603(2006)064

- $195 \text{ MeV} \leq T \leq 352 \text{ MeV}$
- 2+1 flavor in the sea
- pion mass 320 MeV

[HotQCD, PRL 130 (2023) 23, 231902]

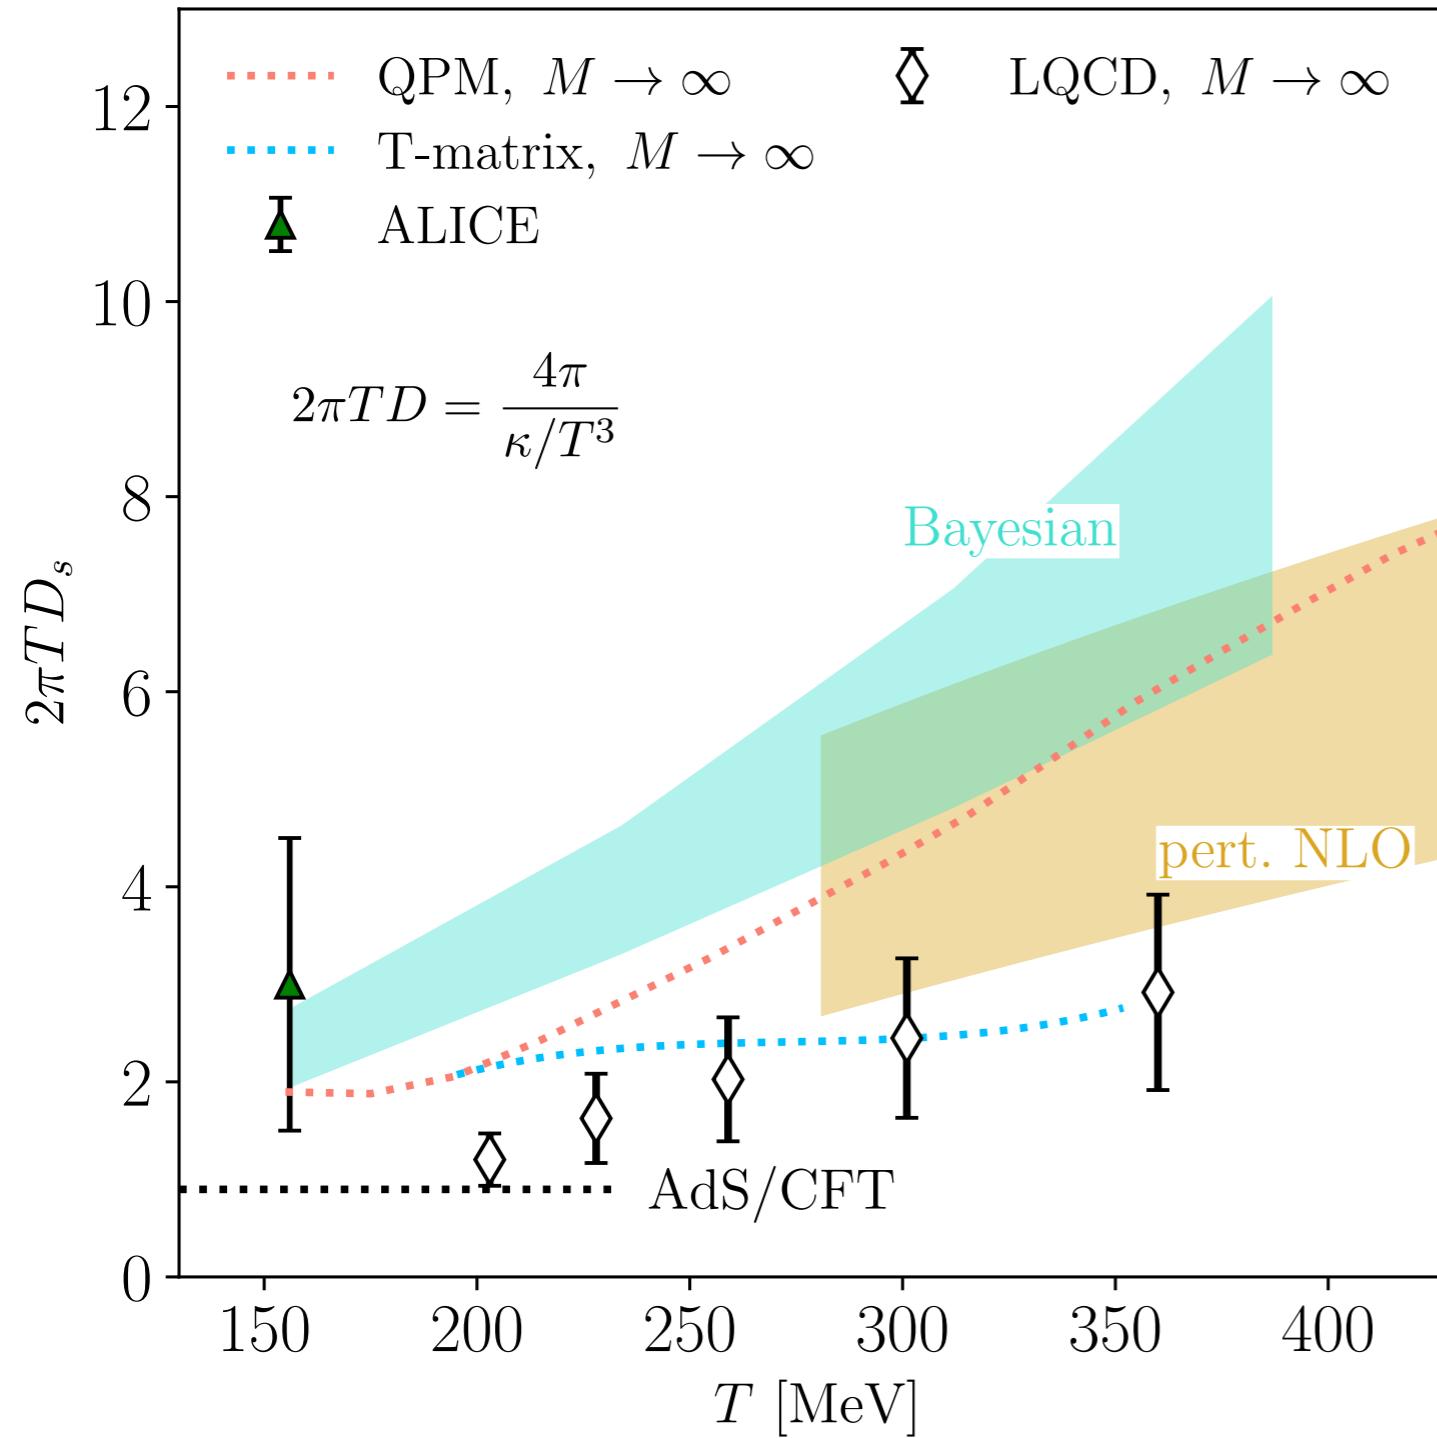

Spectra analysis

$$G(\tau, T) = \int \frac{d\omega}{\pi} K(\omega, \tau, T) \rho(\omega, T)$$

$$\left\{ \begin{array}{l} \rho_{\max} \equiv \max(\phi_{\text{IR}}, \phi_{\text{UV}}) \\ \rho_{\text{smax}} \equiv \sqrt{\phi_{\text{IR}}^2 + \phi_{\text{UV}}^2} \\ \rho_{\text{plaw}} \equiv \begin{cases} \phi_{\text{IR}} & \text{for } \omega \leq \omega_{\text{IR}}, \\ a\omega^b & \text{for } \omega_{\text{IR}} < \omega < \omega_{\text{UV}}, \\ \phi_{\text{UV}} & \text{for } \omega \geq \omega_{\text{UV}}, \end{cases} \end{array} \right.$$

HQ diffusion coefficient at HQ mass limit

- Agree with AdS/CFT at $\sim T_c$
- Agree with T-matrix estimate at moderate and high temperature
- Agree with NLO perturbative estimate at high temperature
- Mild temperature dependence
- Rapid equilibrium \longleftrightarrow QGP is near perfect fluid

$$\tau_{\text{kin}} = \frac{1}{\eta_D} = \frac{1}{\kappa/T^3} \left(\frac{T_c}{T} \right)^2 \left(\frac{M}{1.5 \text{ GeV}} \right) \frac{3 \text{ GeV}}{T_c^2}$$

[HotQCD, PRL 130 (2023) 23, 231902]

Finite mass correction

Physical charm & bottom quark not infinitely heavy!

$$M_c : \sim 1.3 \text{ GeV}$$

$$M_b : \sim 4.5 \text{ GeV}$$

D. Guazzini, et al., JHEP 10 (2007) 081

$$\kappa_E : M_Q \rightarrow \infty$$

$$\xrightarrow{\quad} \langle \mathcal{F}(t')\mathcal{F}(t) \rangle = q^2 \left\{ \langle E_i(t')E_j(t) \rangle + \frac{1}{3} \langle \mathbf{v}^2 \rangle \langle \delta_{ij} B_k(t')B_k(t) - B_j(t')B_i(t) \rangle \right\}$$

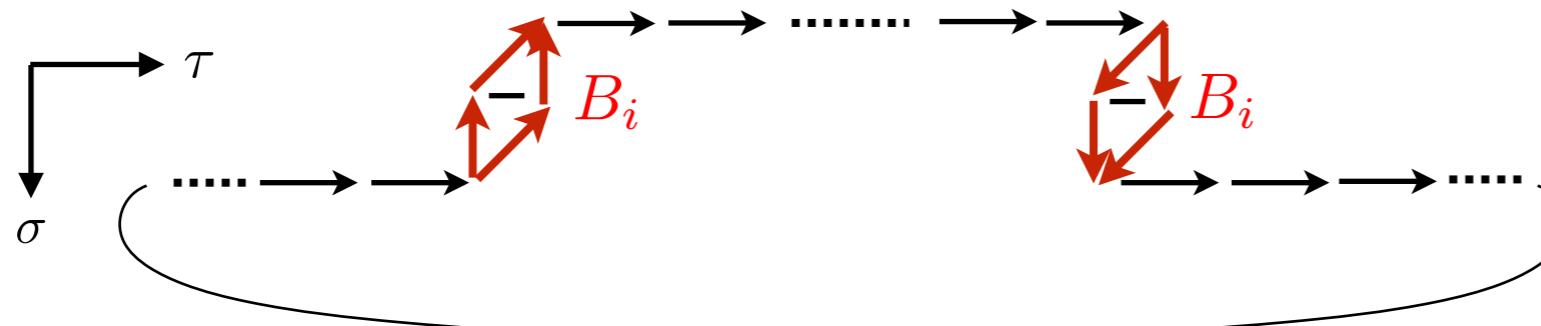

Infinite heavy limit Finite mass correction

$$\kappa = \kappa_E + \frac{2}{3} \langle \mathbf{v}^2 \rangle \kappa_B$$

$$\frac{2}{3} \cdot \langle \mathbf{v}^2 \rangle_{\text{charm}} : 18\% \sim 30\%$$

$$\frac{2}{3} \cdot \langle \mathbf{v}^2 \rangle_{\text{bottom}} : 7\% \sim 13\%$$

$$D_s = \frac{2T^2}{\kappa} \implies D_s = \frac{2T^2}{\kappa} \cdot \frac{\langle p^2 \rangle}{3MT}$$

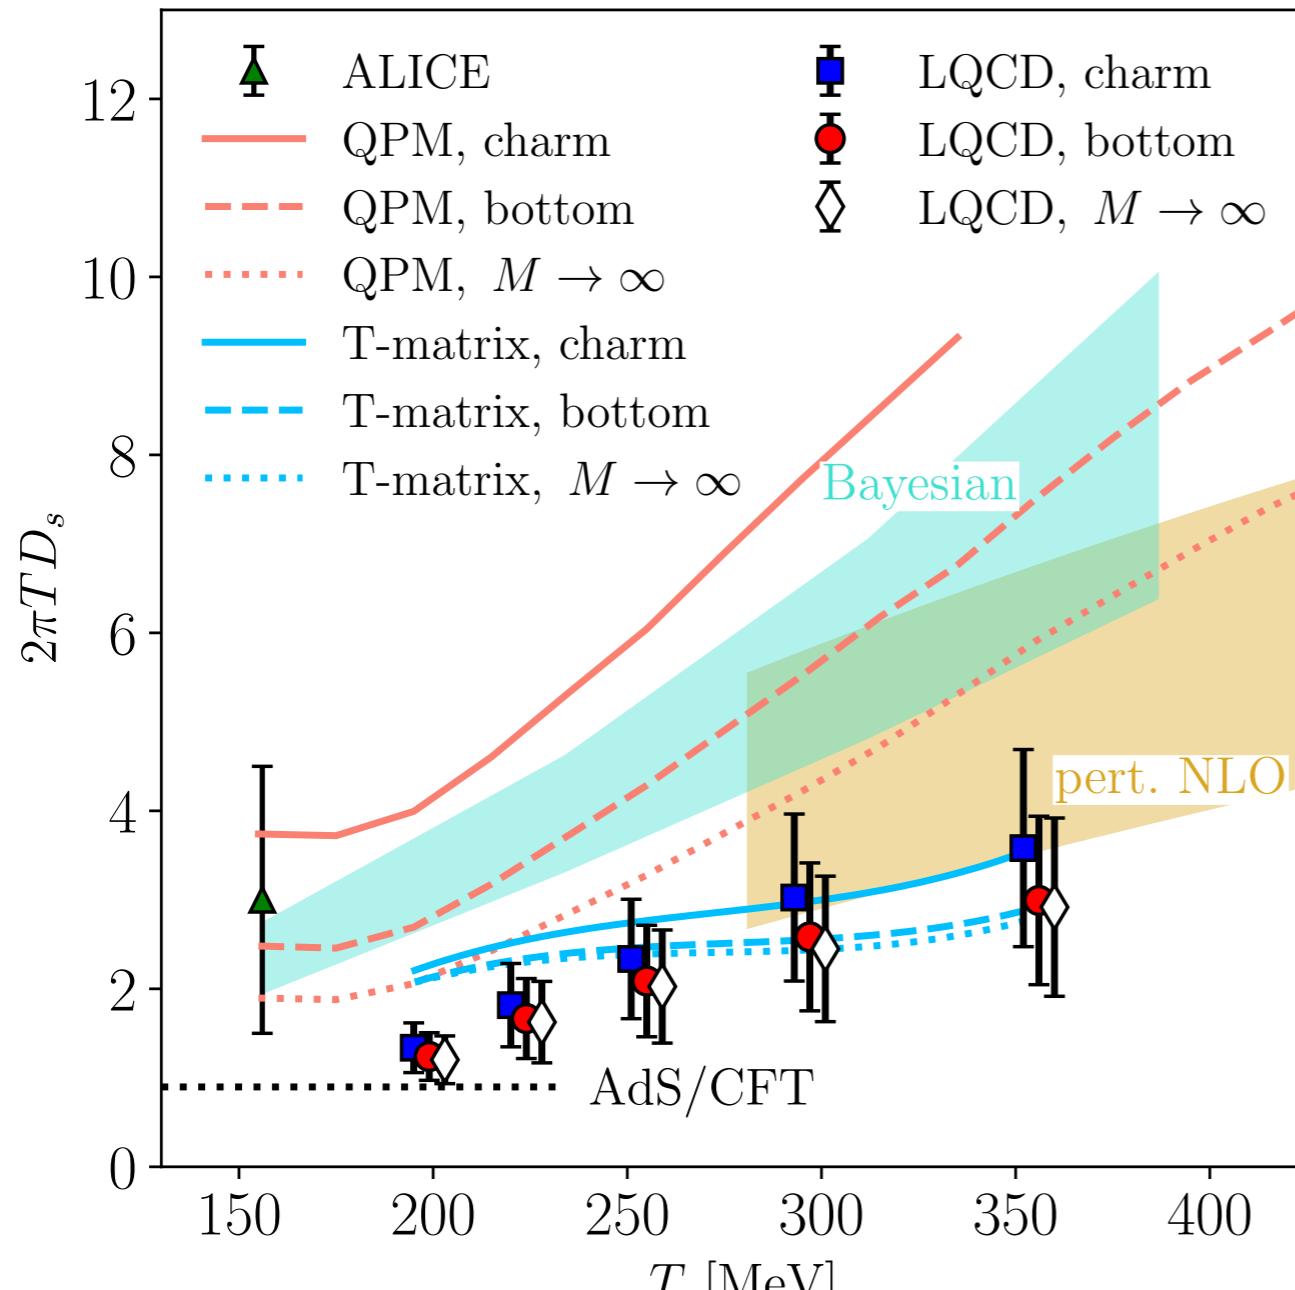

Color-magnetic field correlation function

A. Bouttefoux, M. Laine, JHEP 12 (2020) 150

$$G_B^{\text{phys.}} = Z_{\text{match}} G_B^{\text{flow}}(\tau_F)$$

Charm and Bottom quark diffusion

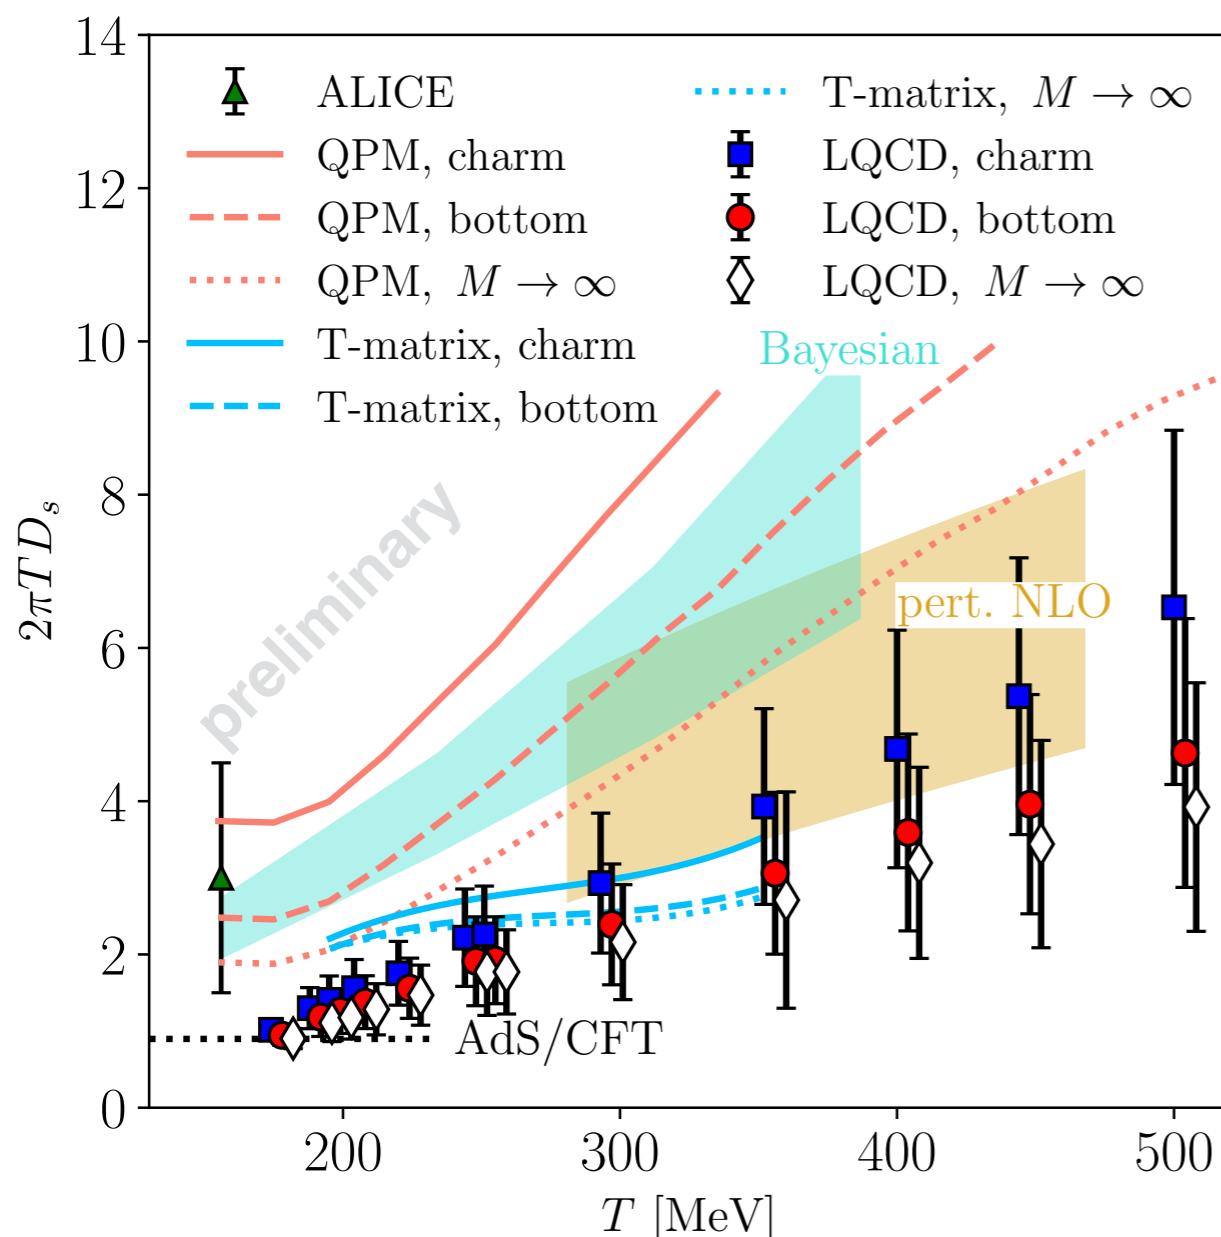

First full QCD determination of charm&bottom quark diffusion!

[HotQCD, PRL 132 (2024) 5, 051902]

- HQ mass dependence of HQ diffusion: mild
- Universal change pattern with quark mass
- Weak quark mass dependence in LQCD & T-matrix
- Weaker than quasi-particle model (QPM) calculations

HQ diffusion at the physical point

[J.D. Golan, Swagato Mukherjee, P. Petreczky,
HTS, J.H. Webber, work in progress]

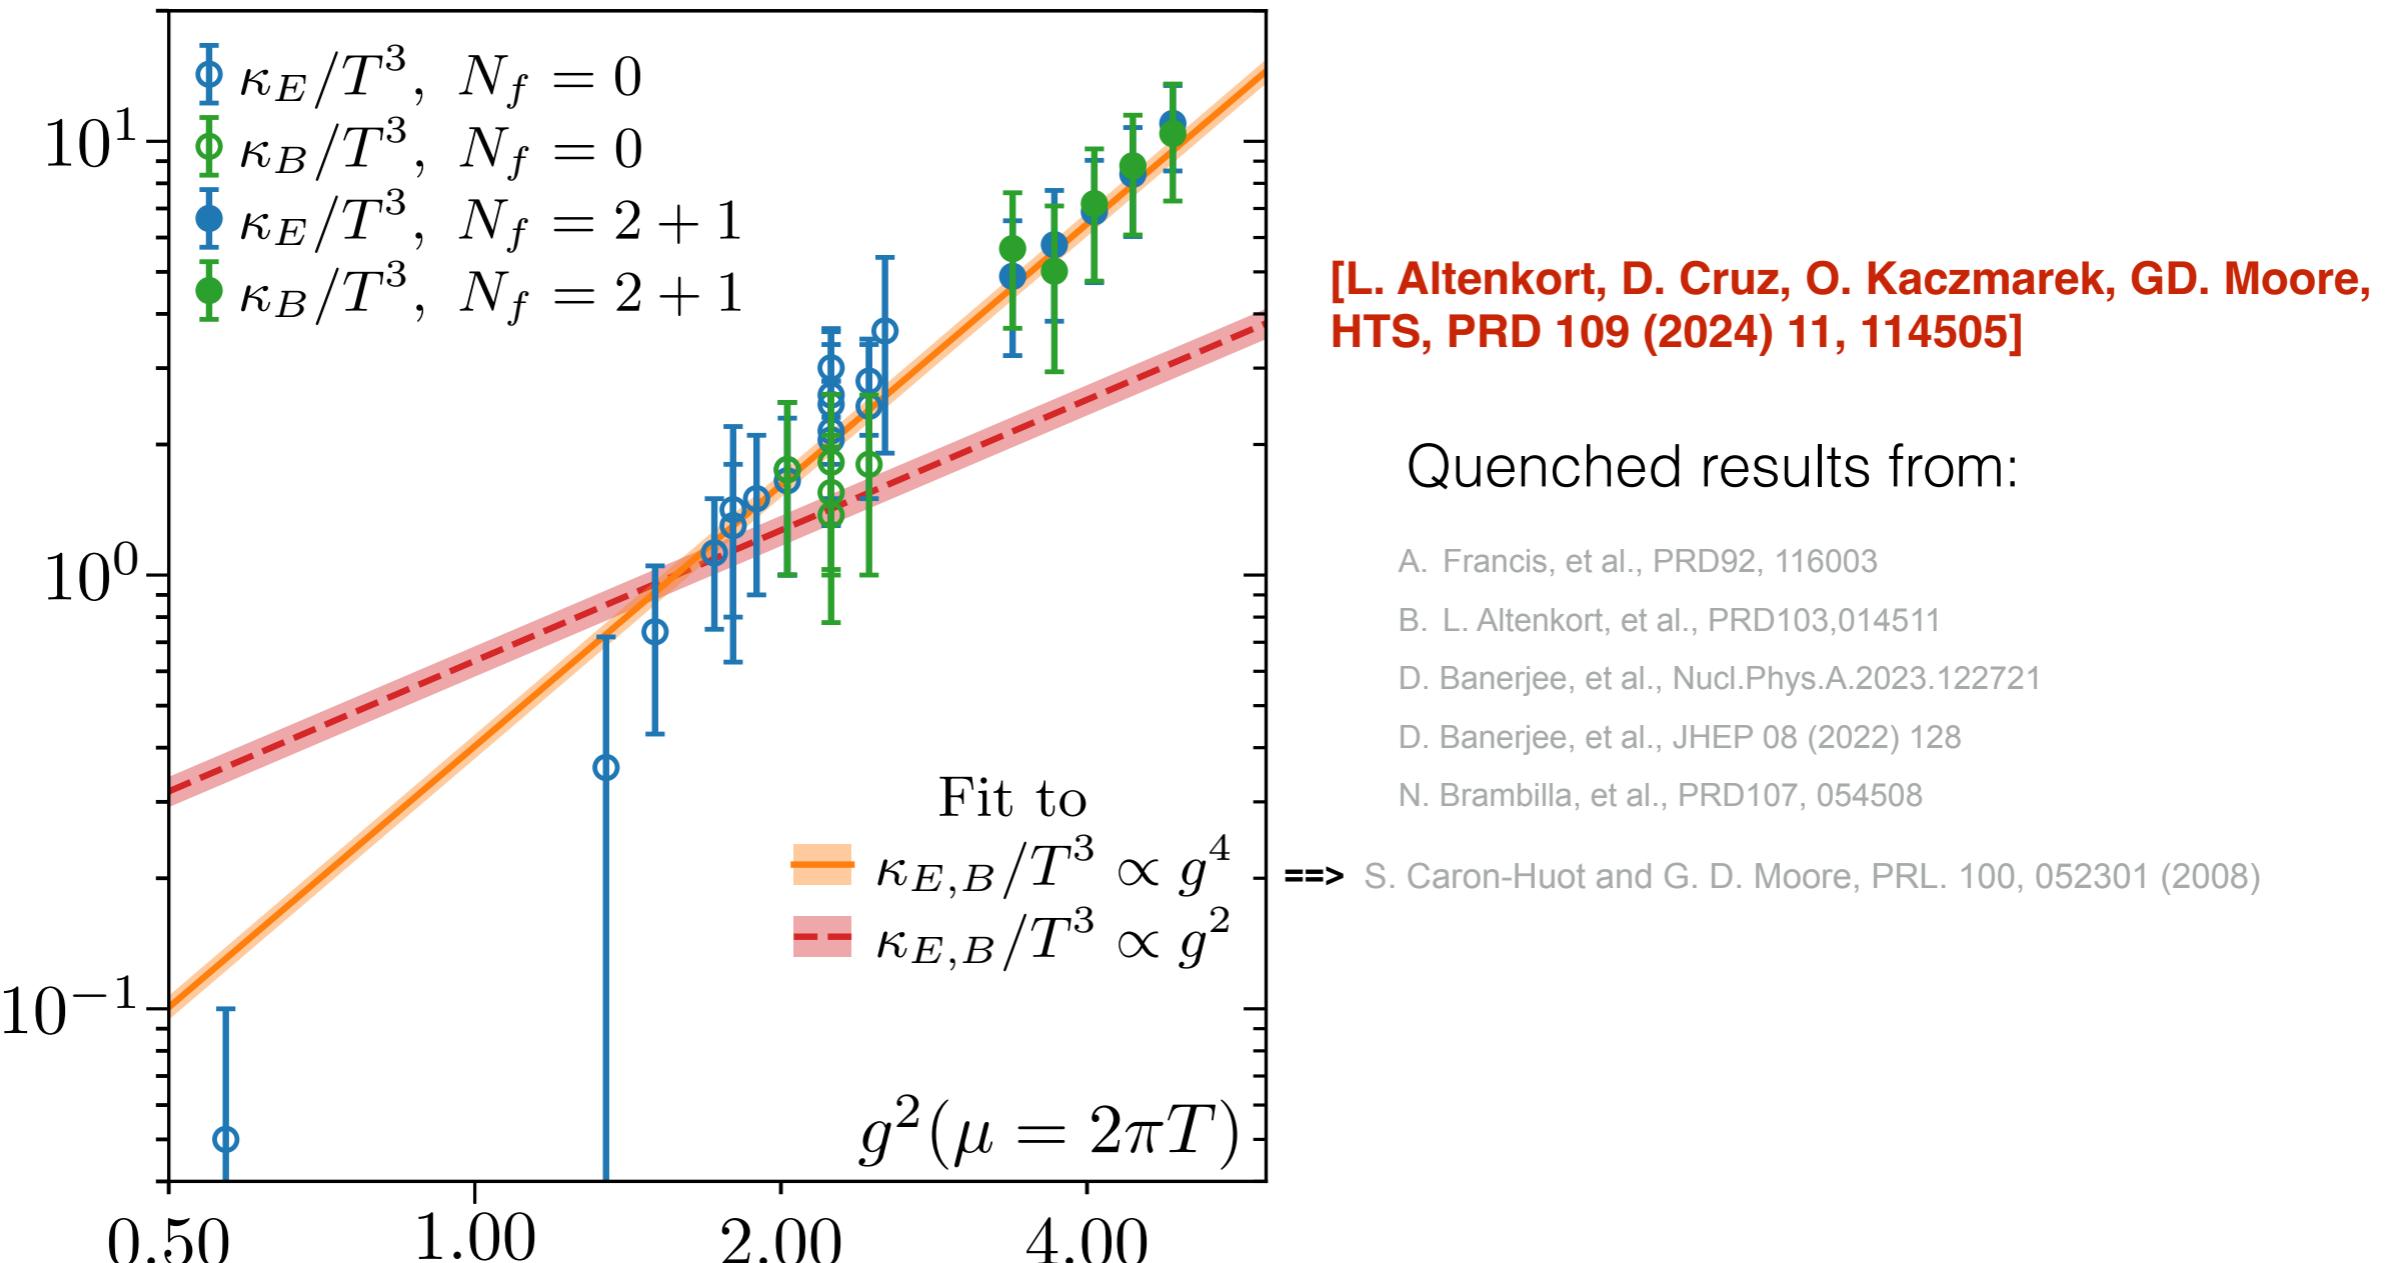

$195 \text{ MeV} \leq T \leq 352 \text{ MeV}$ $m_\pi \sim 320 \text{ MeV}$

$174 \text{ MeV} \leq T \leq 500 \text{ MeV}$ $m_\pi \sim 160 \text{ MeV}$

Increasing stat. for $T = 153 \text{ MeV}, 164 \text{ MeV}$

- Physical pion mass
- Wide temperature range down to 174 MeV and up to 500 MeV
- Consistent observation as previous studies
- Almost invisible light quark mass dependence

κ_E v.s. κ_B

[L. Altenkort, D. Cruz, O. Kaczmarek, GD. Moore,
HTS, PRD 109 (2024) 11, 114505]

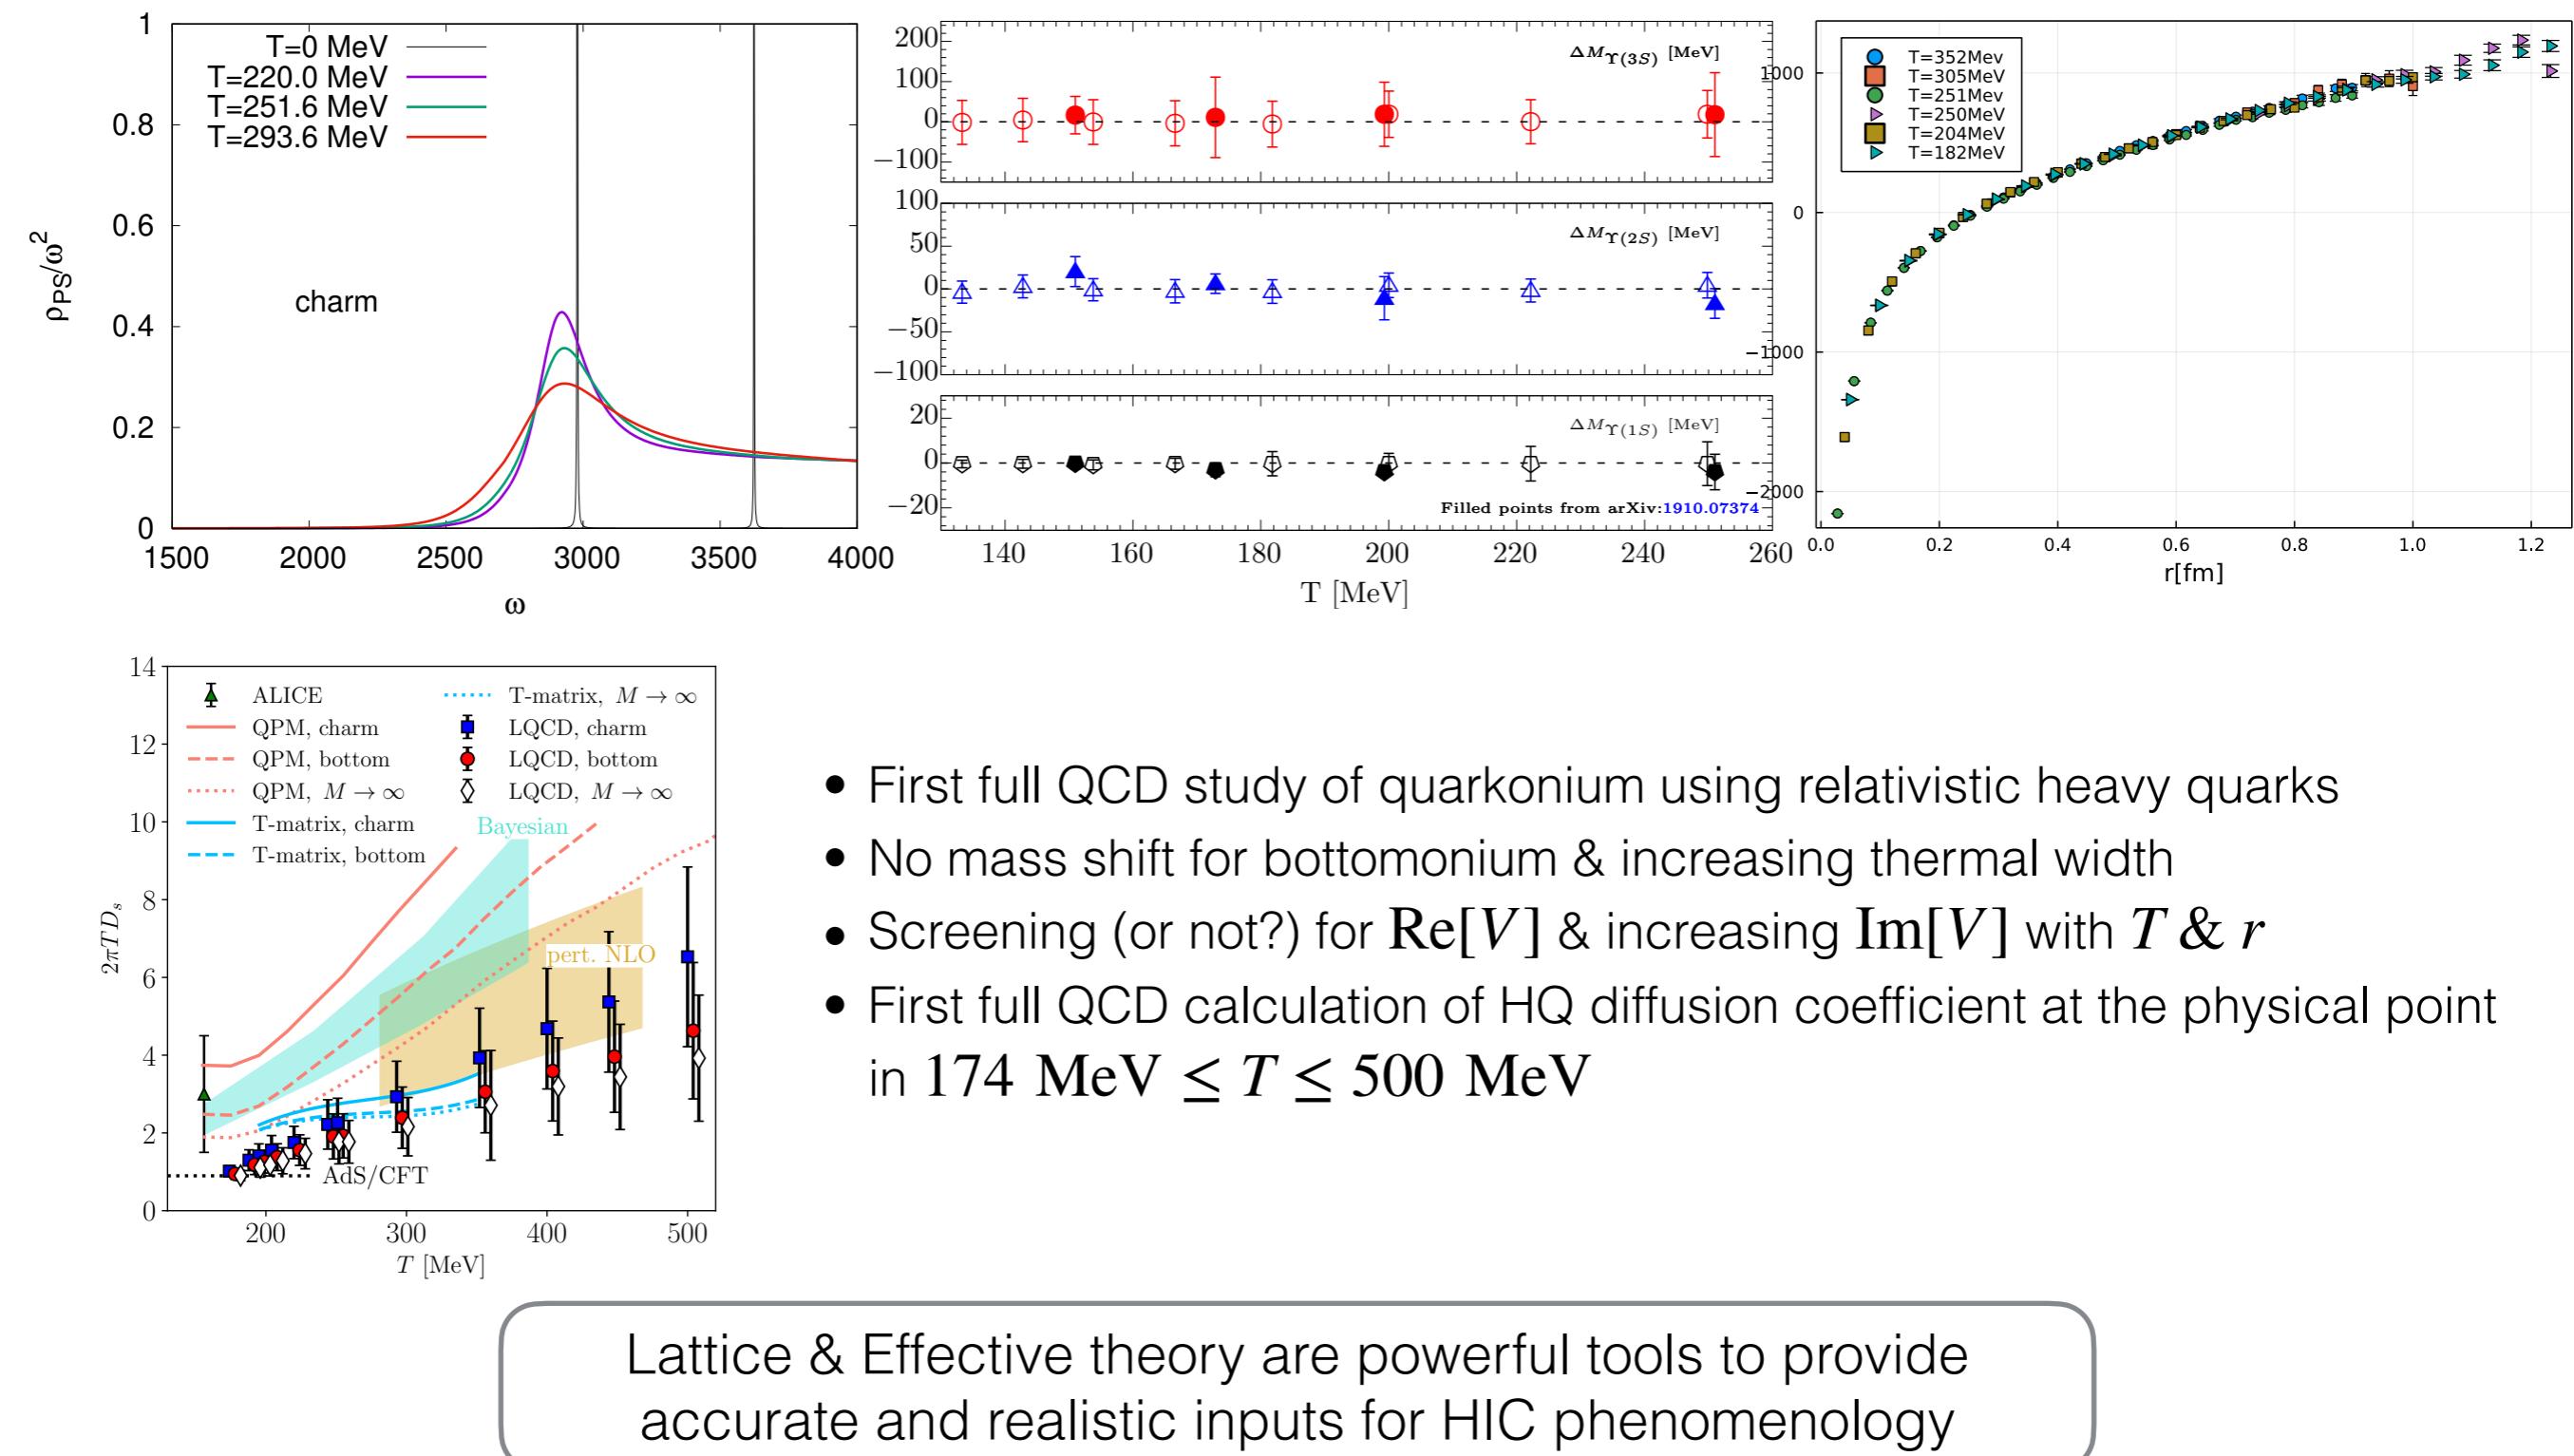

Quenched results from:

- A. Francis, et al., PRD92, 116003
- B. L. Altenkort, et al., PRD103,014511
- D. Banerjee, et al., Nucl.Phys.A.2023.122721
- D. Banerjee, et al., JHEP 08 (2022) 128
- N. Brambilla, et al., PRD107, 054508

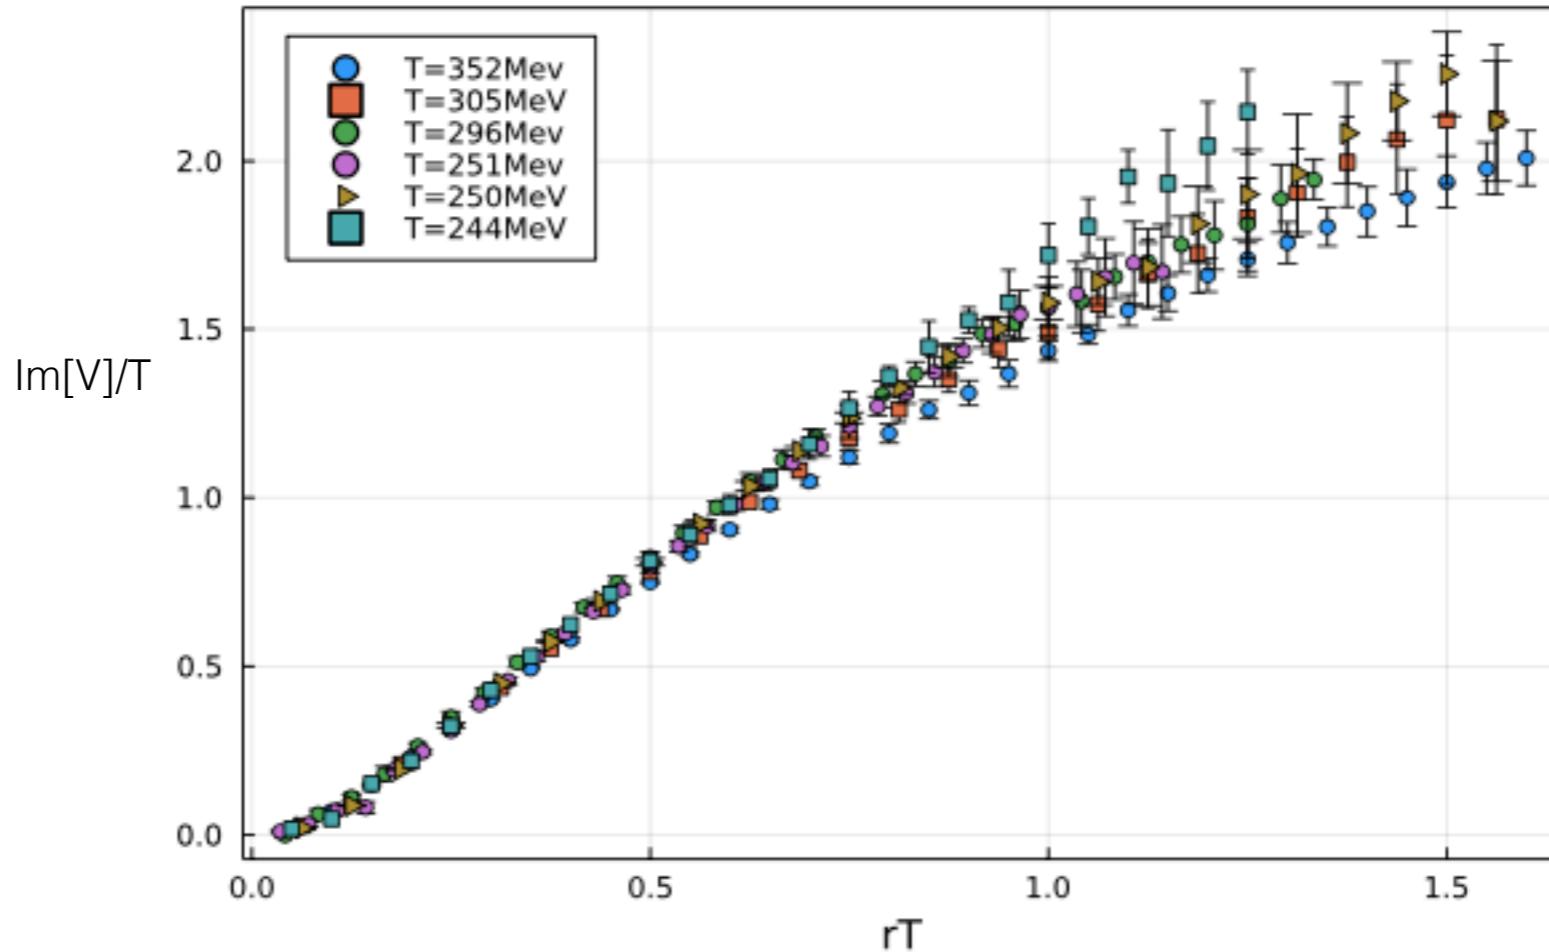

=> S. Caron-Huot and G. D. Moore, PRL. 100, 052301 (2008)

- Similar magnitude for κ_E and κ_B in full QCD & quenched
- Smooth connection between quenched and full QCD in temperature
- Lattice results confirms the form suggested by pert. computations

Major updates since HP 2023

Backup: why no screening

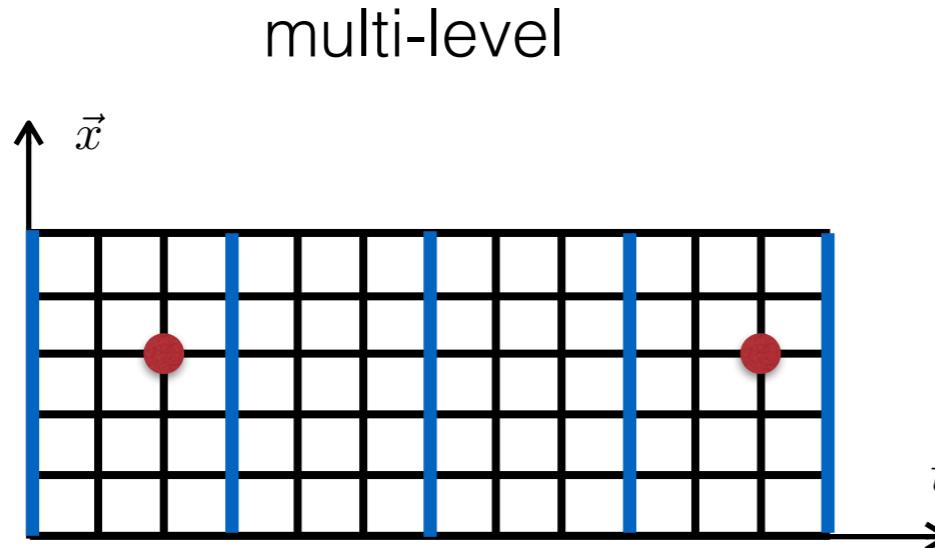

$t \gg 1/T$ for free energy, dissociation & recombination
 $1/\text{Im}[V] < 1/T$ decays within time scale

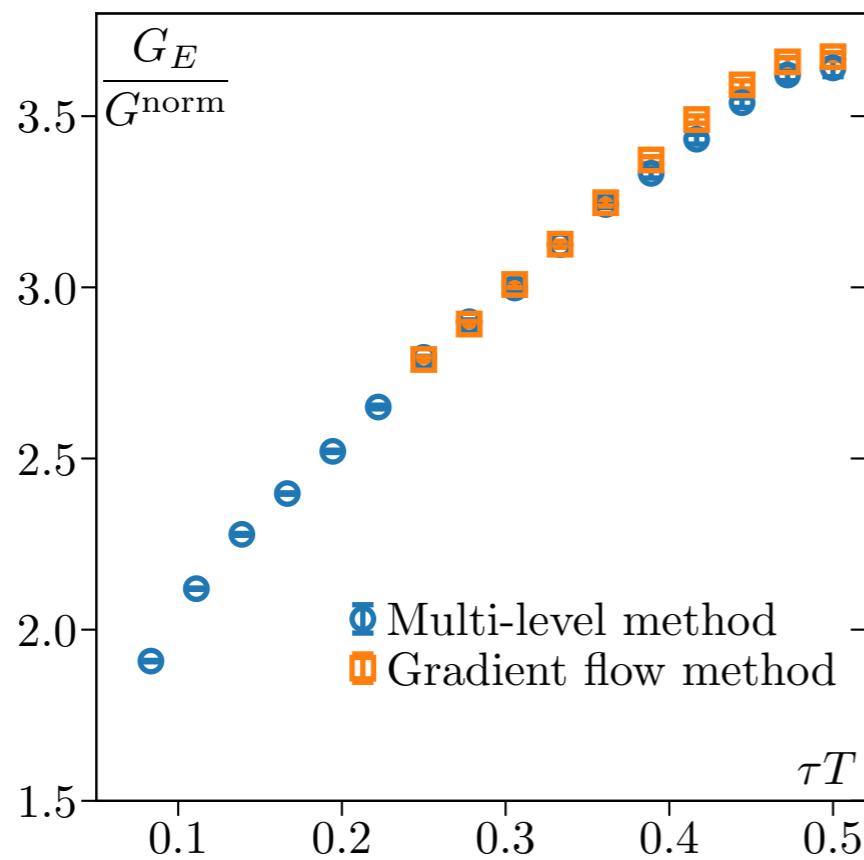

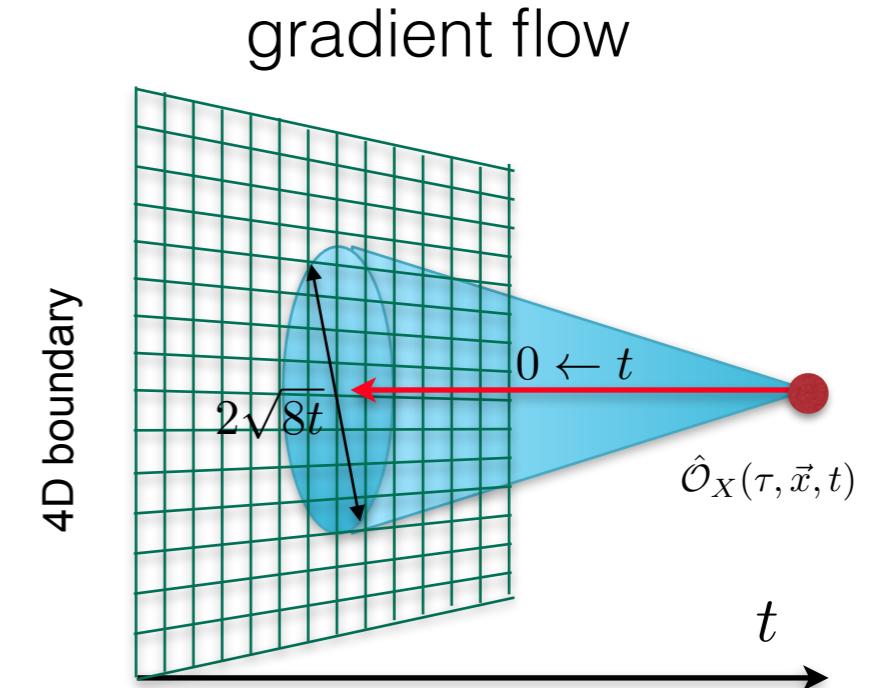

$$\langle P(\mathbf{m})P(\mathbf{n})^\dagger \rangle = e^{-a N_T F_{\bar{q}q}(a|\mathbf{m}-\mathbf{n}|)} = e^{-F_{\bar{q}q}(r)/T}$$

$$W(\tau, r, T) = \int_{-\infty}^{+\infty} d\omega e^{-\omega\tau} \rho_r(\omega, T)$$

Multi-level v.s. gradient flow can go!!!!

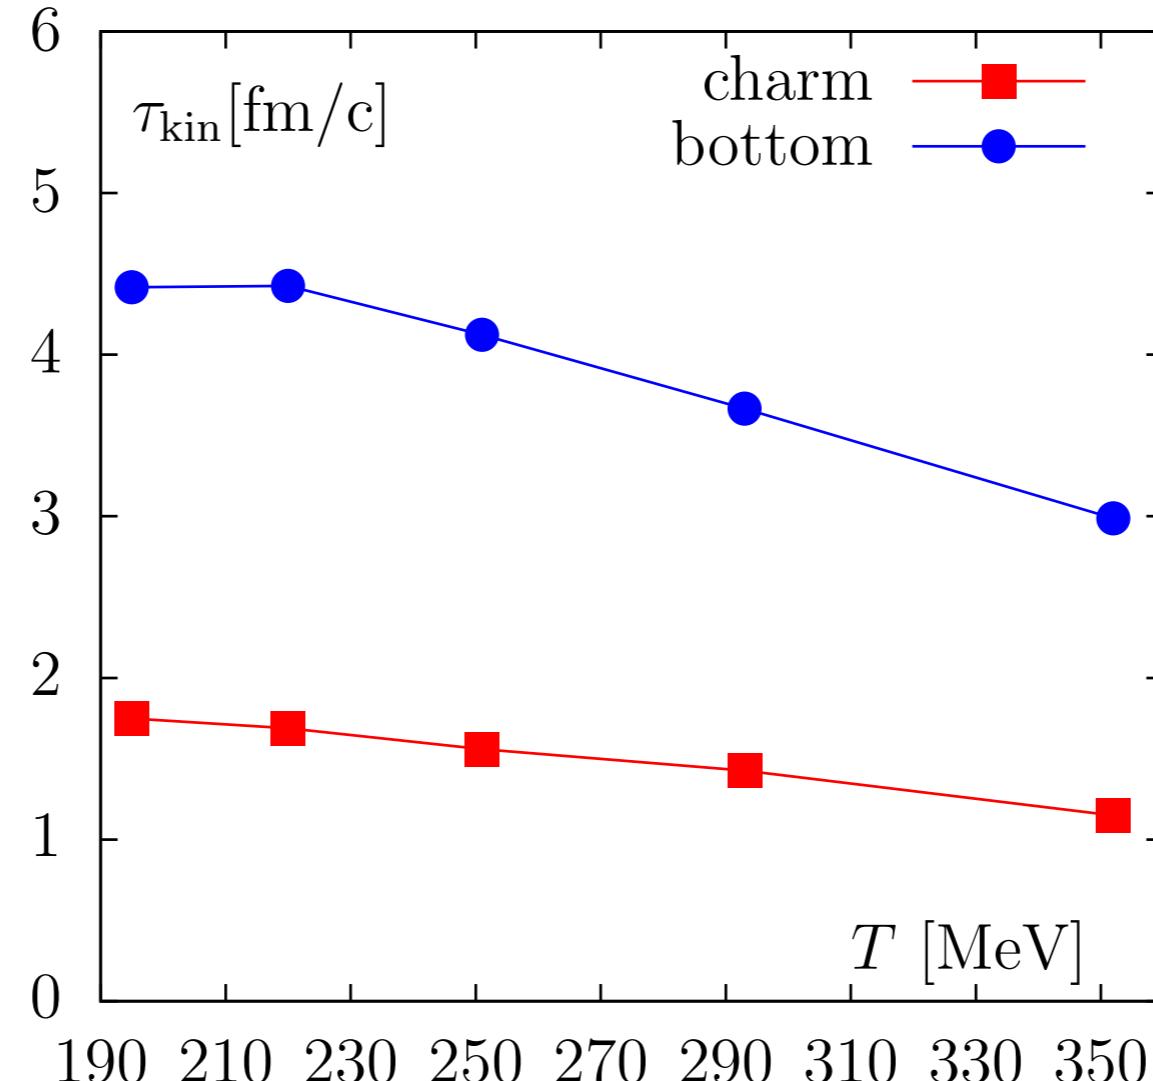

v.s.

- Consistent quenched results from ML & GF
- Gradient flow paves the way to full QCD

L. Altenkort, HTS, et al., PRD 103 (2021) 1, 014511

Backup: equilibration time

$$\tau_{\text{kin}} = \frac{1}{\eta_D} = \frac{1}{\kappa/T^3} \left(\frac{T_c}{T}\right)^2 \left(\frac{M}{1.5 \text{ GeV}}\right) \frac{3 \text{ GeV}}{T_c^2}$$

- Equilibration time of charm quark favors the experimental estimate (~ 1 fm/c for all)

Backup: full QCD setup

$N_f = 2 + 1$, HISQ, $m_\pi = 320$ MeV

T [MeV]	β	am_s	am_l	N_σ	N_τ	# conf.
195	7.570	0.01973	0.003946	64	20	5899

352	8.249	0.01011	0.002022	96	20	2488

- Wide temperature range
- Different lattice spacings
- Large lattices towards thermodynamic limit

Backup: anomalous dimension of B-field

- Anomalous dimension in MSbar-scheme

$$Z_B = 1 + \frac{g^2 C_A}{(4\pi)^2} \left[\frac{1}{\epsilon} + 2 \ln \left(\frac{\bar{\mu} e^{\gamma_E}}{4\pi T} \right) - 2 \right] + \mathcal{O}(g^4)$$

- Gradient flow-scheme \rightarrow MSbar-scheme \rightarrow physical values

- Scale dependence must go for “WeWant” and $\langle BB \rangle_{\tau_F}$

$$Z^2 = \left(1 - 2 \frac{g^2 C_A}{16\pi^2} \ln(\mu^2 \tau_F) \right) \left(1 + 2K \frac{g^2 C_A}{16\pi^2} \right) \equiv Z_f^2 Z_K^2$$

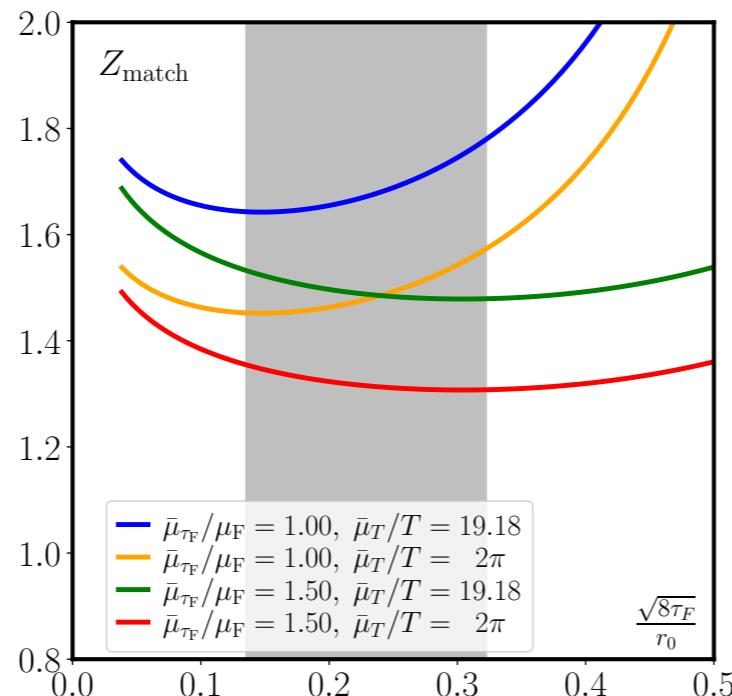

$$\text{WeWant} = Z_B^2 \langle BB \rangle_{\text{MS}}$$

$$\langle BB \rangle_{\tau_F} \equiv Z^{-2} \langle BB \rangle_{\text{MS}}$$

$$\text{WeWant} = Z_B^2 Z^2 \langle BB \rangle_{\tau_F}$$

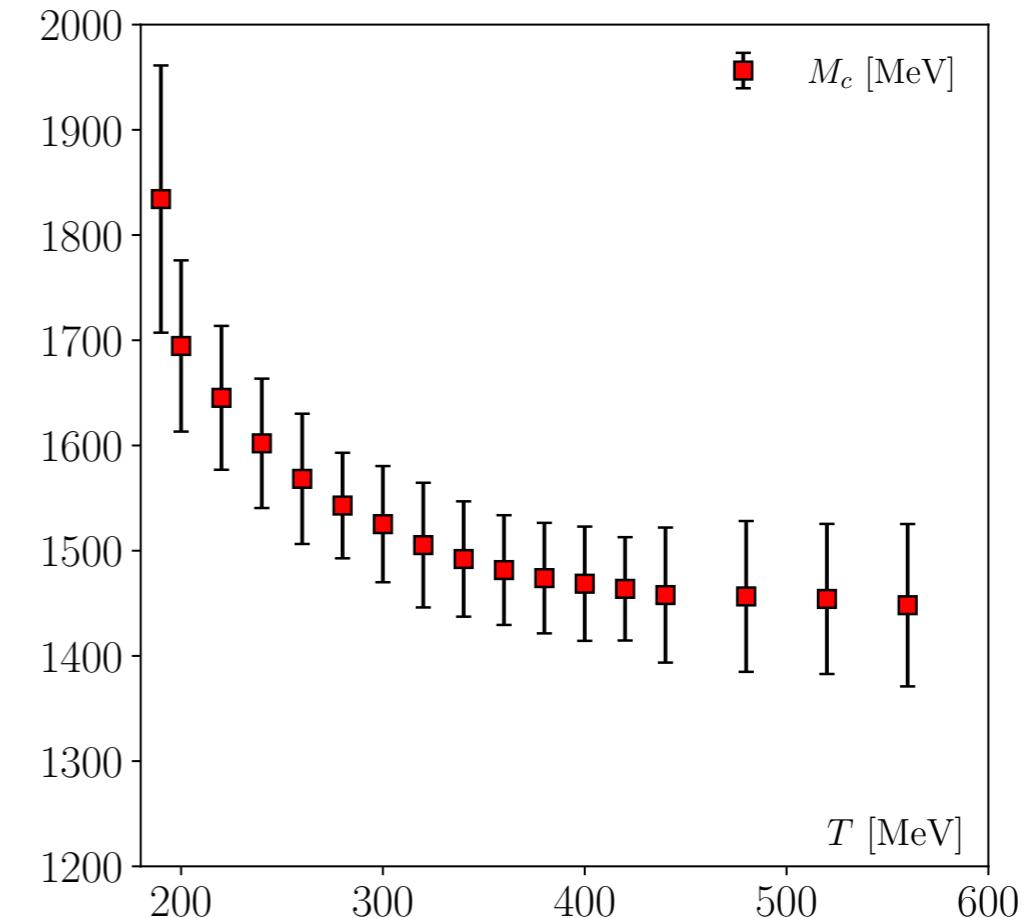

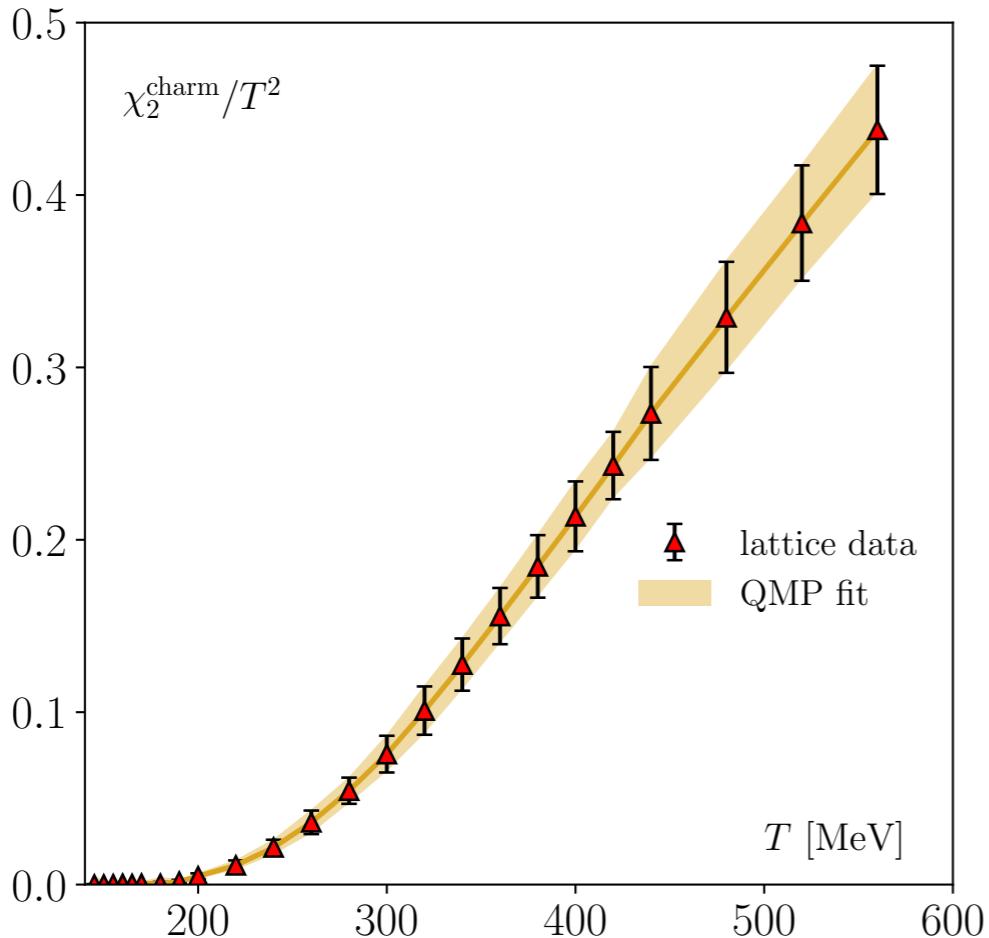

- Determination of the matching factor

$$\ln Z_{\text{match}} = \int_{\bar{\mu}_T^2}^{\bar{\mu}_{\tau_F}^2} \gamma_0 g_{\overline{\text{MS}}}^2(\bar{\mu}) \frac{d\bar{\mu}^2}{\bar{\mu}^2} + \gamma_0 g_{\overline{\text{MS}}}^2(\bar{\mu}_T) \left[\ln \frac{\bar{\mu}_T^2}{(4\pi T)^2} - 2 + 2\gamma_E \right] - \gamma_0 g_{\overline{\text{MS}}}^2(\bar{\mu}_{\tau_F}) \left[\ln \frac{\bar{\mu}_{\tau_F}^2}{4\mu_F^2} + \gamma_E \right]$$

[PRL 132 (2024) 5, 051902]

Backup: T-dependent charm quark mass

$$\frac{\chi_2^{\text{charm}}}{T^2} = \frac{4N_c}{(2\pi T)^3} \int d^3p e^{-E_p/T}$$

$$E_p^2(T) = m^2(T) + p^2$$

[PRL 132 (2024) 5, 051902]

$$\rightarrow m(T)$$

$$\kappa = \kappa_E + \frac{2}{3} \langle \mathbf{v}^2 \rangle \kappa_B$$

$$D_s = \frac{2T^2}{\kappa} \cdot \frac{\langle p^2 \rangle}{3MT}$$

$$\langle v^2 \rangle = \left(\int d^3p \frac{p^2}{E_p^2} e^{-E_p/T} \right) / \left(\int d^3p e^{-E_p/T} \right)$$

$$\langle p^2 \rangle = \left(\int d^3p p^2 e^{-E_p/T} \right) / \left(\int d^3p e^{-E_p/T} \right)$$
