Heavy flavor jets

In theory

Heavy flavor jets

In theory

dead cone

$$d\mathcal{P}(\theta) \propto \frac{d\theta^2}{(\theta^2 + \theta_0^2)^2}$$

$$\theta_0 = m_Q / E_Q$$

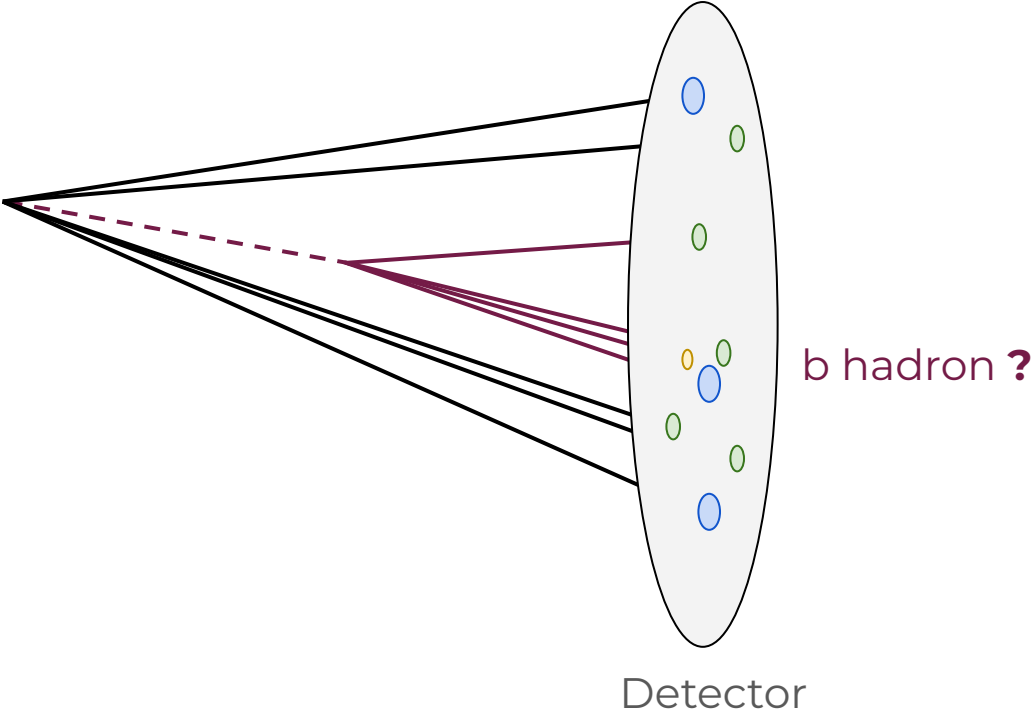

mass dependent shower

$$P_{Q \rightarrow Qg}(z) = \frac{1-z}{z} + \frac{z}{2} - 2\mu_{Qg}^2$$

$$\mu_{Qg}^2 = \frac{m_Q^2}{m_{Qg}^2 - m_Q^2}$$

Heavy flavor jets

In practice

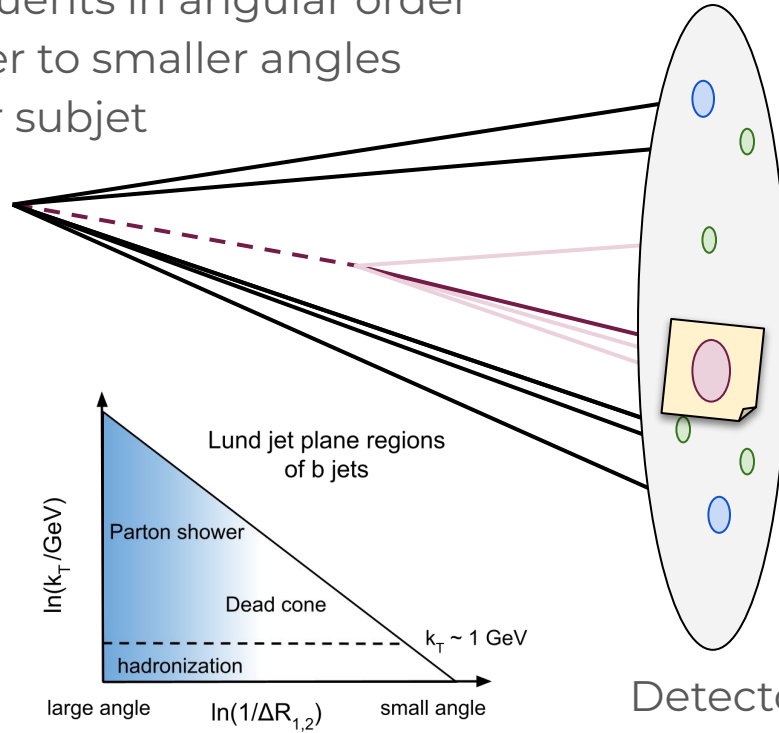

Jet substructure

The primary Lund jet plane

- ▶ Recluster jet constituents in angular order
- ▶ Decluster from larger to smaller angles following the harder subjet
- ▶ Register

$$\Delta R^2 = \Delta y^2 + \Delta \phi^2$$

$$k_T = p_{T,2} \cdot \Delta R$$

Detector

Jet substructure

Soft drop grooming

- ▶ Same as before, but **stop** when

$$z = \frac{\min(p_{T,1}, p_{T,2})}{p_{T,1} + p_{T,2}} > z_{\text{cut}} \cdot \left(\frac{\Delta R_{1,2}}{R} \right)^\beta$$

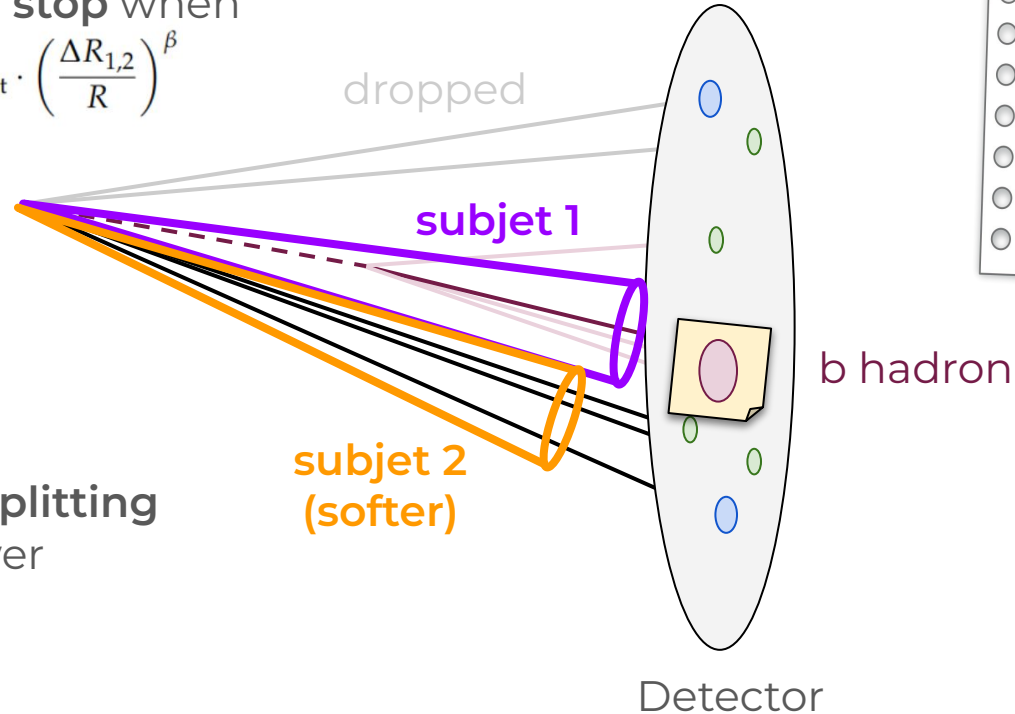

- ▶ Register

$$R_g = \Delta R$$

$$z_g = z$$

$$k_T$$

Partial b hadron reconstruction

Treat b hadron decays by identifying the decay products in the jet and cluster them into **partially reconstructed b hadron**

Signal (✓) = from b hadron decay
Background (✗) = from primary interaction

Partial b hadron reconstruction

Treat b hadron decays by identifying the decay products in the jet and cluster them into **partially reconstructed b hadron**

detector level
with decays

detector level
without decays

particle level
without decays

it works!

Analysis workflow

Inclusive jets

AK4Chs jets in kinematic region

b-tagged jets

Jets passing ParticleNet XXT working point

b-tagged single-b jets

Single-b fraction extraction via template fit

Unfolded b-tagged single-b jets

Unfolding with matrix inversion

Unfolded single-b jets

b tagging efficiency correction

Dataset and jet kinematics

5.02 TeV low PU pp collisions

$100 < p_T^{\text{jet}} < 120 \text{ GeV}$, $|\eta^{\text{jet}}| < 2$

Observables

charged particle R_g , z_g

and $z_{b,\text{ch}} \equiv p_T^{b,\text{ch}} / p_T^{\text{jet},\text{ch}}$

Soft drop parameters

$$z_{\text{cut}} = 0.1, \beta = 0$$

$$\Rightarrow p_{T,2} / (p_{T,1} + p_{T,2}) > 0.1$$

1-prong (fail soft drop) or $k_T < 1 \text{ GeV}$ (hadronization) in dedicated bin for unfolding

b jet selection and corrections

b tagging

b jets selected with ParticleNet
at very high purity working point

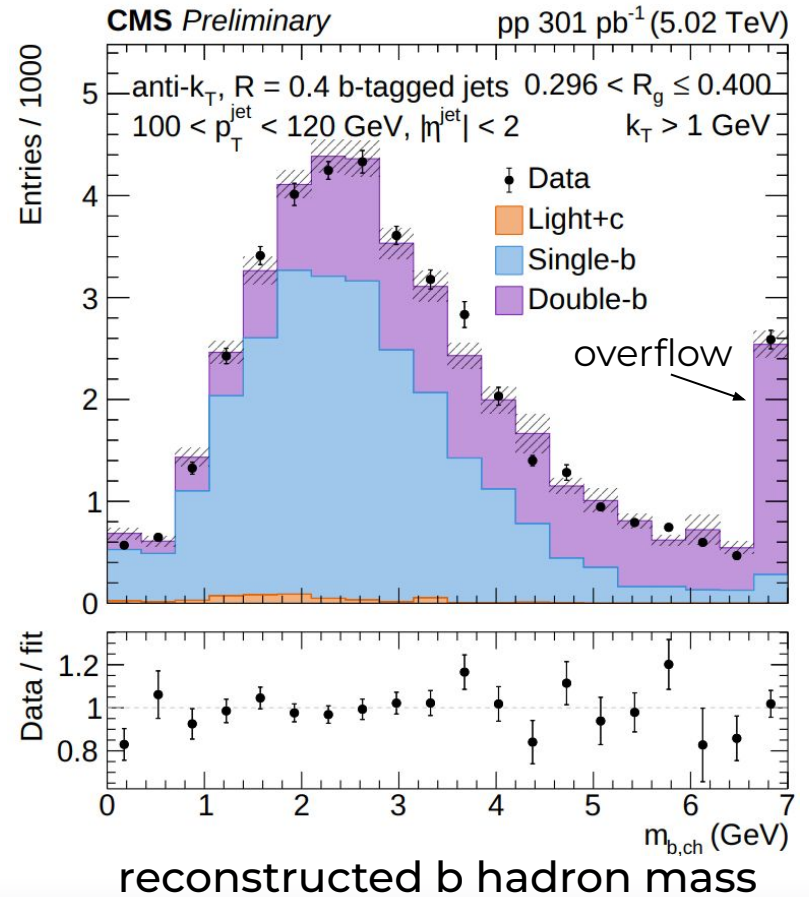

But...

Sample includes jets with
more than one b hadron

Residual background subtraction

Fit the mass of the reconstructed b hadron
with MC templates

Unfolding to the charged-particle level b jet

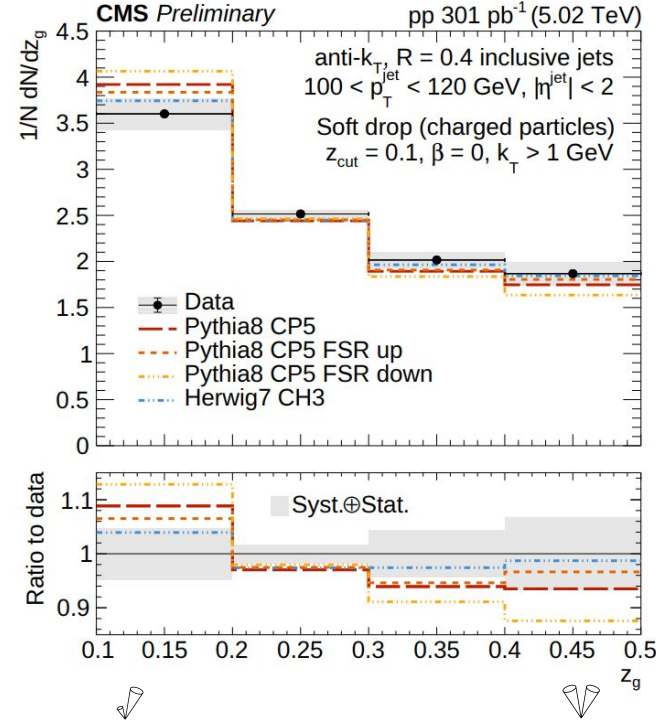

Inclusive jet results

Groomed jet radius

Groomed momentum balance

Inclusive jet results

Groomed jet radius

Groomed momentum balance

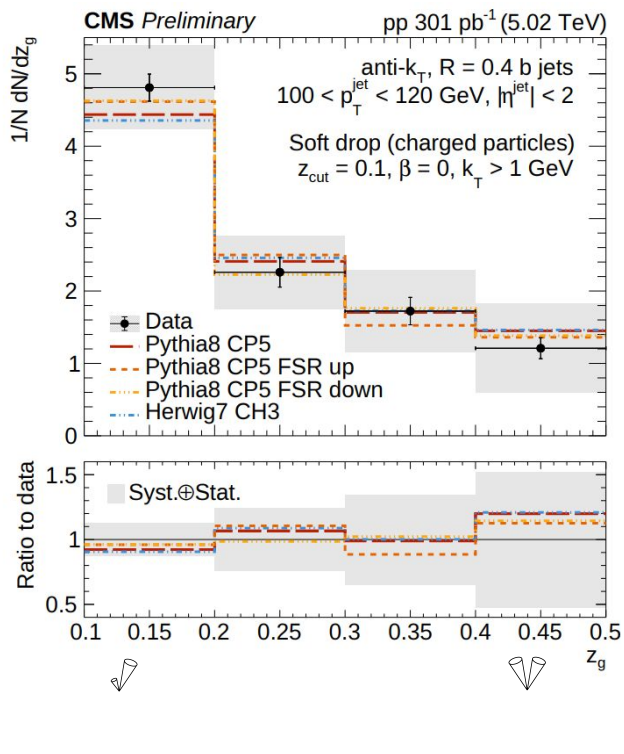

Dominated by physics modeling systematics
 Good agreement with HERWIG7 but not with PYTHIA8

b jet results

Groomed jet radius

Groomed momentum balance

Fragmentation function

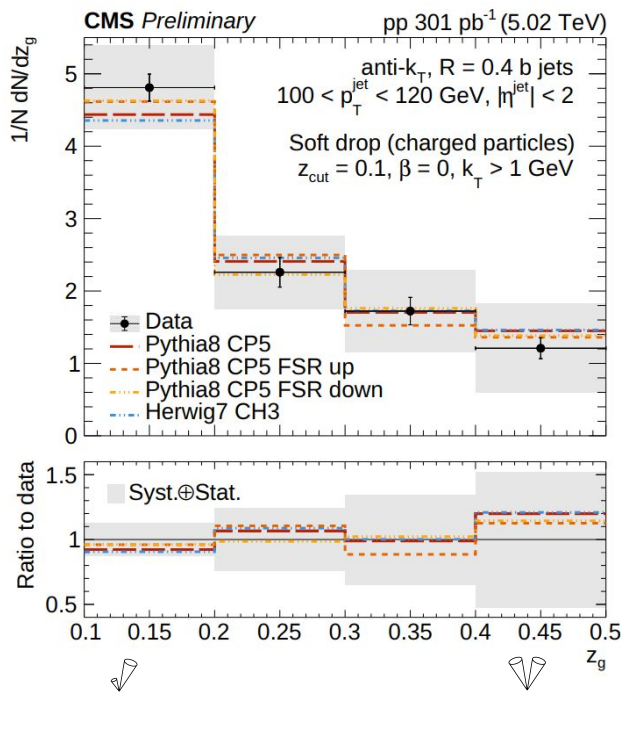

b jet results

Groomed jet radius

Groomed momentum balance

Fragmentation function

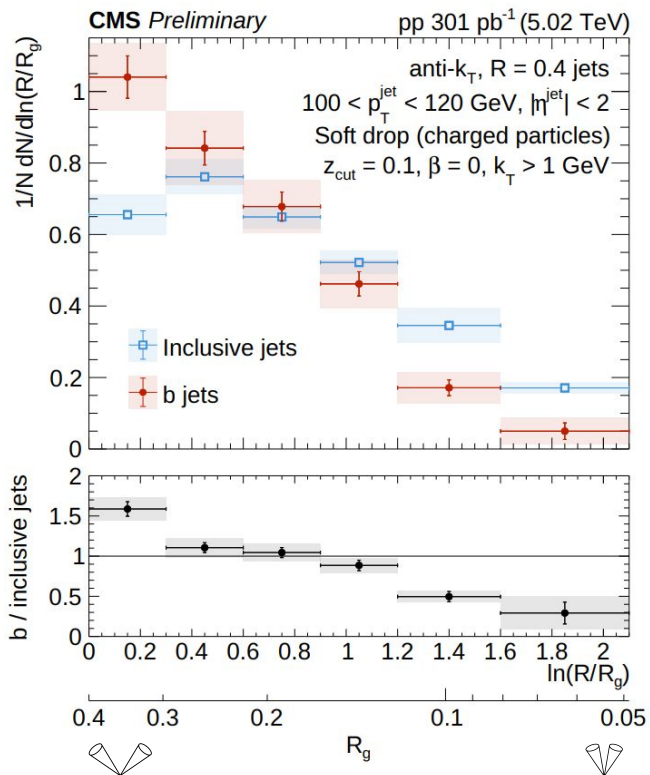

Dominated by physics modeling systematics

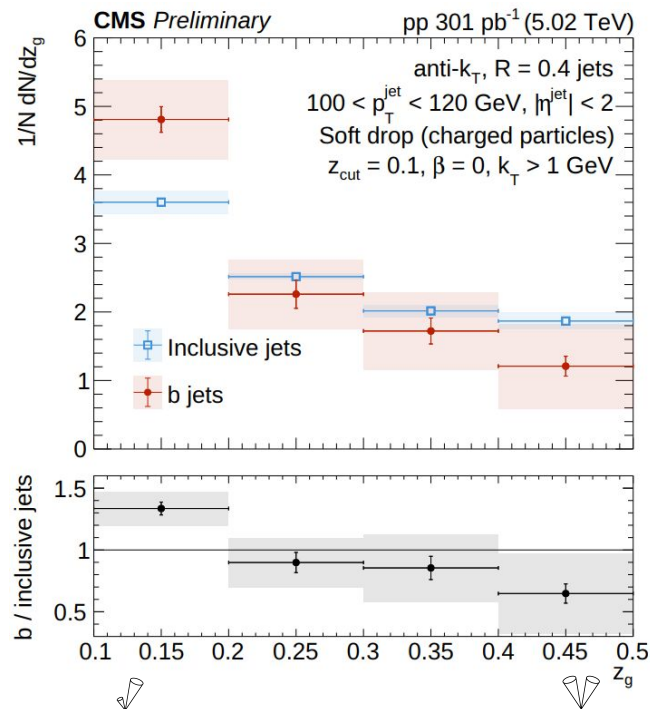

Models ~agree with z_g, z_{b,ch} but **not** R_g

Ratio to inclusive

Groomed jet radius

Groomed momentum balance

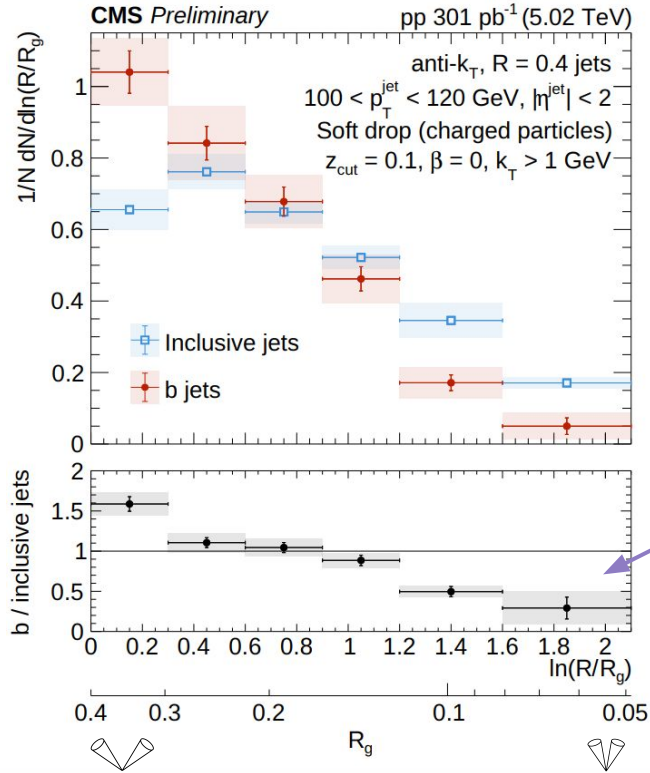

1-prong or low k_T ~38% for inclusive
 and ~68% for b jets

Ratio to inclusive

Groomed jet radius

Groomed momentum balance

Suppressed small angle radiation
 ⇒ **dead cone** manifestation

1-prong or low k_T ~38% for inclusive
 and ~68% for b jets

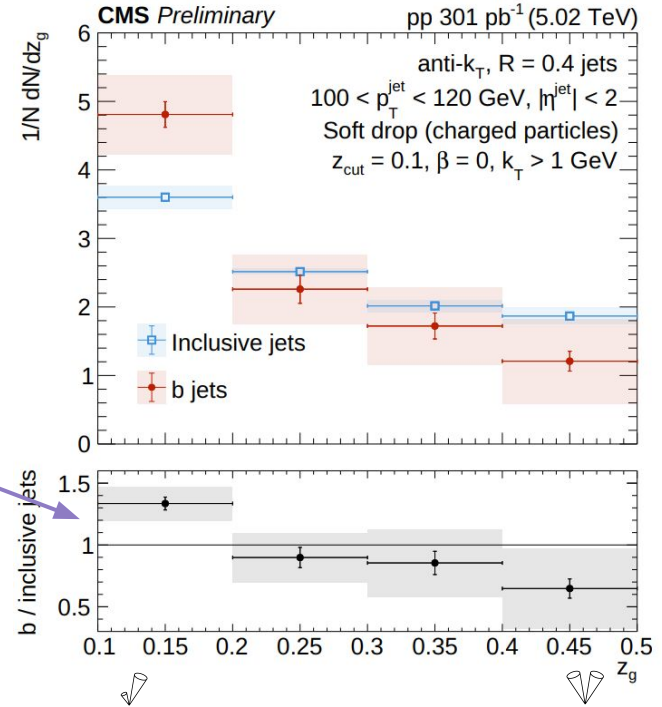

Ratio to inclusive

Groomed jet radius

Groomed momentum balance

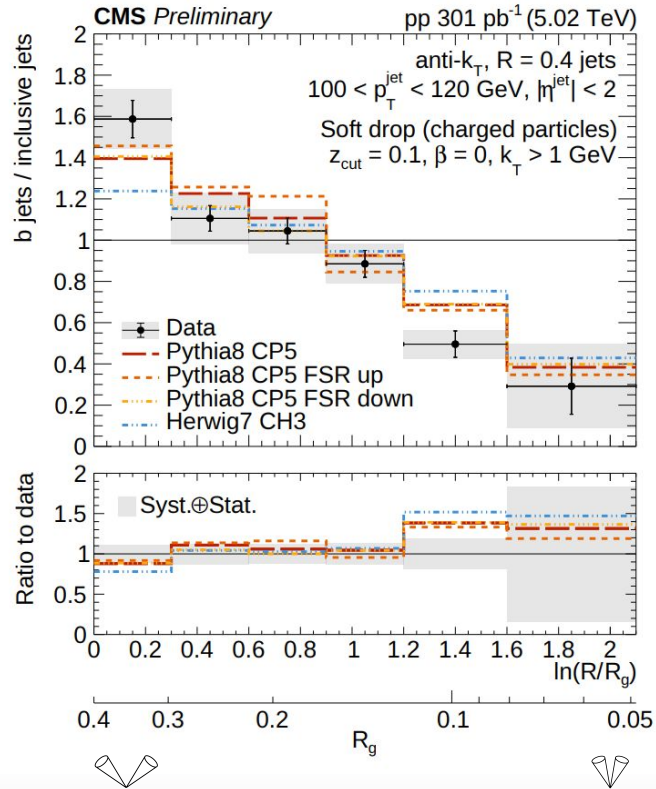

1-prong or low k_T ~38% for inclusive
and ~68% for b jets

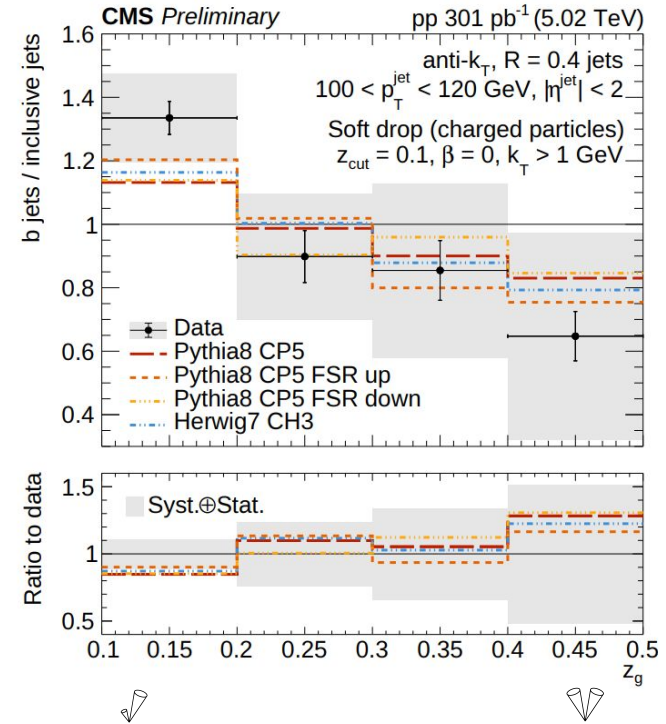

Ratio to inclusive

Groomed jet radius

Groomed momentum balance

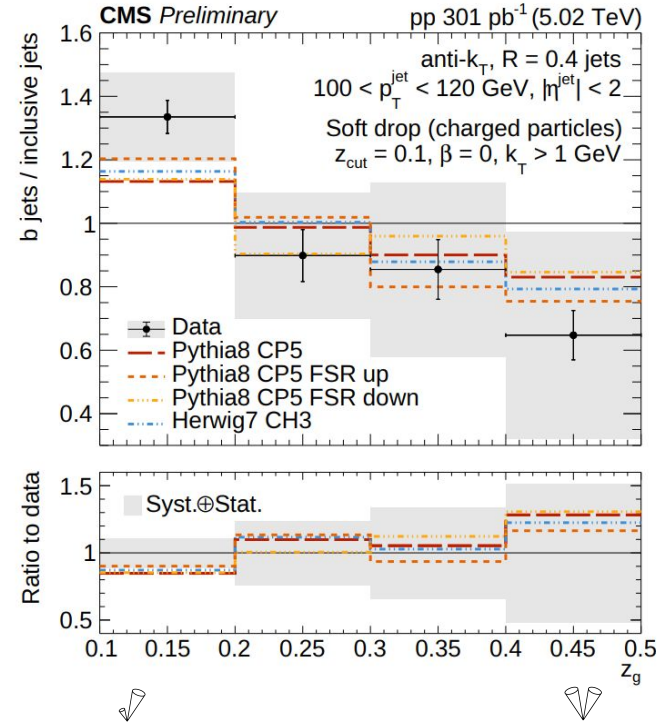

Ratio to inclusive

Groomed jet radius

Groomed momentum balance

Models ~agree with z_g
 PYTHIA8 in agreement with R_g but not HERWIG7

Prospects in HI collisions

Isolate medium induced radiation in dead cone region

[Phys. Rev. D 107, 094008](#)

Conclusion

b hadron decays crucial for b jet substructure measurements
⇒ developed a tool to partially reconstruct the b hadron

First time we clearly observe the suppression of collinear emissions for b jets
(**dead cone**)

**Separation of b hadron decay from QCD cascade can be used for other observables
in the future** (EECs, generalized angularities, masses)

Backup

Decay product identification

Binary classifier

- ▶ Gradient boosted decision tree
 - Signal = charged decay products
 - Background = charged particles from PV
- ▶ Inputs
 - Track properties (eg. impact parameter)
 - Associated SV properties (eg. flight distance)

Agreement between the detector and the particle level

Impossible to “unfold” the decay effects

Multiple bin migrations to “decay angle”

Systematic uncertainties

Both for inclusive and b jets

- ▶ **Statistical uncertainty**
- ▶ **Matrix response statistical uncertainty** (jackknife resampling)
- ▶ **Shower and hadronization** (unfolding with HERWIG7 CH3 vs PYTHIA8 CP5)
- ▶ **FSR and ISR scale** (x2 or x1/2 independently in PYTHIA8 CP5)
- ▶ **Jet energy resolution** (vary JER scale factors)
- ▶ **Jet energy scale** (vary JEC per source)
- ▶ **Tracking efficiency** (randomly discard 3% of reconstructed tracks in PYTHIA8 CP5)

Only for b jets

- ▶ **b jet fraction model dependence** (template fit with HERWIG7 CH3 vs PYTHIA8 CP5)
- ▶ **Light and charm misidentification rate** (vary light+c fraction in template fit)
- ▶ **b tagging efficiency** (vary b tagging efficiency scale factors)

Systematic uncertainties

Leading sources related to physics model and b tagging

- ▶ **Shower and hadronization** (unfolding with HERWIG7 CH3 vs PYTHIA8 CP5)
- ▶ **FSR and ISR scale** (x2 or x1/2 independently in PYTHIA8 CP5)
- ▶ **b tagging efficiency** (vary b tagging efficiency scale factors)
