

# Determination of $V_{cb}$ from Exclusive Decays

*Monday 23 September 2024 16:00 (30 minutes)*

We present a determination of  $V_{cb}$  taking into account the most recent data on exclusive decays as well as form factor calculations from lattice QCD. We employ unitarity constraints within the Boyd-Grinstein-Lebed (BGL) parametrization and carefully study their impact on the results. Furthermore, we give updated Standard Model predictions for the lepton-flavor non-universality observables  $R(D^{(*)})$ .
