

Determination of V_{cb} from Exclusive Decays

Monday, September 23, 2024 4:00 PM (30 minutes)

We present a determination of V_{cb} taking into account the most recent data on exclusive decays as well as form factor calculations from lattice QCD. We employ unitarity constraints within the Boyd-Grinstein-Lebed (BGL) parametrization and carefully study their impact on the results. Furthermore, we give updated Standard Model predictions for the lepton-flavor non-universality observables $R(D^{(*)})$.
