

$\mathcal{R}(D^{(*)})$ at LHCb

Greg Ciezarek, on behalf of the LHCb collaboration

CERN

September 24, 2024

$$\bar{B} \rightarrow D^{(*)} \tau^- \bar{\nu}_\tau$$

- In the SM, the only difference between $\bar{B} \rightarrow D^{(*)} \tau^- \bar{\nu}_\tau$ and $\bar{B} \rightarrow D^{(*)} \mu^- \bar{\nu}_\mu$ is the mass of the lepton
- Ratio $R(D^{(*)}) = \mathcal{B}(\bar{B} \rightarrow D^{(*)} \tau^- \bar{\nu}_\tau) / \mathcal{B}(\bar{B} \rightarrow D^{(*)} \mu^- \bar{\nu}_\mu)$ is sensitive to e.g. charged Higgs, leptoquarks
 - Form factors mostly cancel (except helicity suppressed amplitude) \rightarrow reduced dependence on theory
- D vs D^* : different meson spin, so different physics sensitivity

Overview

- Three results:
 - $R(D^*)$ and $R(D^0)$ with $\tau \rightarrow \mu\nu\nu$ (LHCb-PAPER-2022-039)
 - $R(D^{*+})$ with $\tau \rightarrow \pi\pi\pi\nu$ (LHCb-PAPER-2022-052)
 - $R(D^{*+})$ and $R(D^+)$ with $\tau \rightarrow \mu\nu\nu$ (LHCb-PAPER-2024-007)
- The two muonic analyses follow broadly the same strategy, will discuss together

Experimental challenge

$$\bar{B}^0 \rightarrow D^{*+} \tau^- \bar{\nu}_\tau$$

$$\bar{B}^0 \rightarrow D^{*+} \mu^- \bar{\nu}_\mu$$

- Difficulty: multiple neutrinos
 - No narrow peak to fit (in any distribution)
- Main backgrounds: partially reconstructed B decays
 - $B \rightarrow D^* \mu \nu, B \rightarrow D^{**} \mu \nu, B \rightarrow D^* D (\rightarrow \mu X) X \dots$
 - Reject these with charged track isolation
- Also combinatorial, misidentified backgrounds

Fit strategy

Phys. Rev. Lett. 115 (2015) 111

$$\bar{B}^0 \rightarrow D^{*+} \tau^- \bar{\nu}_\tau$$

$$\bar{B}^0 \rightarrow D^{*+} \mu^- \bar{\nu}_\mu$$

- Can use B flight direction to measure transverse component of missing momentum
- No way of measuring longitudinal component \rightarrow use approximation to access rest frame kinematics
 - Assume $\gamma\beta_{z,visible} = \gamma\beta_{z,total}$
 - $\sim 20\%$ resolution on B momentum, long tail on high side
- Can then calculate rest frame quantities - $m_{missing}^2$, E_μ , $q^2 \equiv M(\ell\nu)$

Fit strategy

- Three dimensional template fit in E_{μ}^{\prime} (left), $m_{missing}^2$ (middle), and q^2
 - Projections of fit to isolated data shown
- All uncertainties on template shapes incorporated in fit:
 - Continuous variation in e.g different form factor parameters
 - Shape variations for all major backgrounds controlled using data samples
- (Understanding agreement between simulation and data also essential)

One pion sample

LHCb-PAPER-2024-007

- Sample with exactly one additional pion: D^{**} backgrounds
 - Include the four known resonances, individually floating yields
 - Updated model from [Bernlochner, Ligeti](#): all parameters unconstrained

Two pion sample

LHCb-PAPER-2024-007

- Sample with exactly two additional pions: heavier D^{**} backgrounds (including any non-resonant)
- No theory model: cocktail sample, variation in q^2 slope

Kaon sample

LHCb-PAPER-2024-007

- Sample with at least one additional kaon: $B \rightarrow D^0 DX$ backgrounds
 - Also strongly constrained by the previous two samples

Misidentified backgrounds

- Misidentified hadron component derived from data
- Use RICH PID to decompose pions, kaons etc
- Put them back together with different weights, momentum smearing

Misidentified backgrounds

- Inverted muon ID: select misidentified muons
 - We have these backgrounds under good control
 - Systematic uncertainty ~ 4 times smaller than original muonic $\mathcal{R}(D^{*})$

$D^0 \mu^+$ signal sample

- $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}$ now modelled using BGL form-factors, $B^- \rightarrow D^0 \ell^- \bar{\nu}_\ell$ with BCL
 - Helicity-suppressed terms constrained by theory, other parameters float freely
 - $B^- \rightarrow D^0 \ell^- \bar{\nu}_\ell$ form factors from [HPQCD](#)
 - $\bar{B}^0 \rightarrow D^{*+} \ell^- \bar{\nu}$ form factors from: [Bigi, Gambino, Schacht](#)

$D^{*+}\mu^{-}$ signal sample (D^0)

LHCb-PAPER-2022-039

- Excellent fit quality throughout

$D^+ \mu^+$ signal sample

LHCb-PAPER-2024-007

- Neutral isolation rejects $D^{*+} \rightarrow D^+ \pi^0$, reduces cross feed \rightarrow use the D^{*+} as a signal sample, next slide

$D^{*+}\mu^+$ signal sample (D^+)

LHCb-PAPER-2024-007

- Very nice additional sample reconstructed with neutral!
 $D^{*+} \rightarrow D^+ \pi^0$

Data/MC agreement

- Generally percent level agreement, some localised discrepancies \rightarrow systematic

Full uncertainties

 D^0

Internal fit uncertainties	$\sigma_{\mathcal{R}(D^*)}(\times 10^{-2})$	$\sigma_{\mathcal{R}(D^0)}(\times 10^{-2})$	Correlation

Statistical uncertainty	0.043	0.081

$$\tau \rightarrow \pi\pi\pi(\pi^0)$$

LHCb-PAPER-2022-052

- Compared to muonic $\mathcal{R}(D^*)$:
 - Large $\bar{B}^0 \rightarrow D^{*+} \mu^- \bar{\nu}_\mu$, $B \rightarrow D^{*0} \mu^+ \nu$ backgrounds absent
 - Additional $B \rightarrow D^* \pi\pi\pi X$ backgrounds
 - $B \rightarrow D^* DX$ with $D \rightarrow \pi\pi\pi X$
- Need external input: measure rate relative to $B \rightarrow D^* \pi\pi\pi$
- Now updated with 2015+2016 data

Removing $B \rightarrow D^* \pi \pi \pi X$

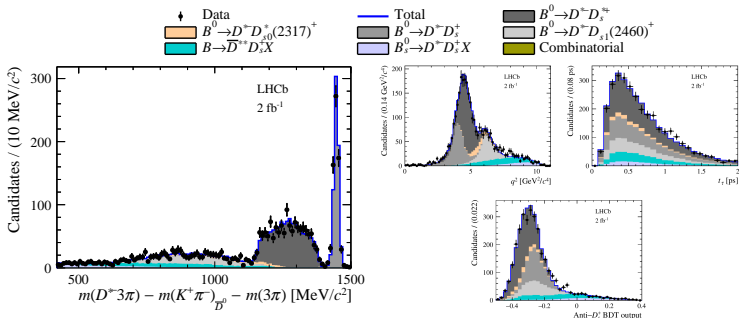

- Can use decay topology to remove direct $B \rightarrow D^* \pi \pi \pi X$ decays:
- If the $\pi \pi \pi$ vertex is displaced from the B vertex, cannot be direct $B \rightarrow D^* \pi \pi \pi X$
- Can remove a large, poorly measured background
 - And control the remainder
- $B \rightarrow D^* D X$ major physics background remaining

D_s BDT

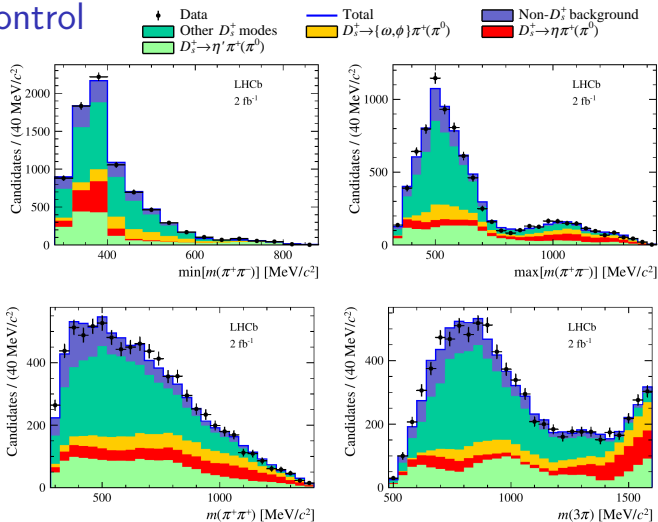

- $[\pi\pi\pi]$ lifetime discriminates between tau and $B \rightarrow D^*DX$
- Can use partial reconstruction techniques to reconstruct D peak in $B \rightarrow D^{*+}D$ (not $B \rightarrow D^*DX$)
- $\tau \rightarrow \pi\pi\pi\nu$ is mostly $a_1(1260)$, $D \rightarrow \pi\pi\pi X$ mostly isn't
 - Use the $\pi\pi\pi$ (sub) structure to separate $\bar{B}^0 \rightarrow D^{*+}\tau^-\bar{\nu}_\tau$ from $B \rightarrow D^{*+}D_s^-X$
- Put everything in an MVA: kinematics, Dalitz, partial reconstruction, neutral isolation

D_s control

- Use data to control $B \rightarrow D^*DX$ modelling
- Can use $D_{(s)} \rightarrow \pi\pi\pi$ mass peak to select a pure $B \rightarrow D^*DX$ sample
- This controls the $B \rightarrow D^*DX$ modelling, but not the $D \rightarrow \pi\pi\pi X$

3. Hadronic tau

 D_s control

- Again, use data to control background modelling
- Use low BDT region to control $D_s \rightarrow \pi\pi\pi X$ substructure

Fit

- 3D template fit in BDT, q^2 , tau lifetime to determine signal yield
- Control fit input implemented via constraints

Uncertainties (relative)

Source	Systematic uncertainty on $\mathcal{K}(D^*)$ (%)
PDF shapes uncertainty (size of simulation sample)	2.0
Fixing $B \rightarrow D^{*-} D_s^+(X)$ bkg model parameters	1.1
Fixing $B \rightarrow D^{*-} D_s^0(X)$ bkg model parameters	1.5
Fractions of signal τ^+ decays	0.3
Fixing the $\bar{D}^{*+} \tau^+ \nu_\tau$ and $D_s^{*+} \tau^+ \nu_\tau$ fractions	+1.8 -1.9
Knowledge of the $D_s^+ \rightarrow 3\pi X$ decay model	1.0
Specifically the $D_s^+ \rightarrow a_1 X$ fraction	1.5
Empty bins in templates	1.3
Signal decay template shape	1.8
Signal decay efficiency	0.9
Possible contributions from other τ^+ decays	1.0
$B \rightarrow D^{*-} D^+(X)$ template shapes	+2.2 -0.8
$B \rightarrow D^{*-} D^0(X)$ template shapes	1.2
$B \rightarrow D^{*-} D_s^+(X)$ template shapes	0.3
$B \rightarrow D^{*-} 3\pi X$ template shapes	1.2
Combinatorial background normalisation	+0.5 -0.6
Preselection efficiency	2.0
Kinematic reweighting	0.7
Vertex error correction	0.9
PID efficiency	0.5
Signal efficiency (size of simulation sample)	1.1
Normalisation mode efficiency (modelling of $m(3\pi)$)	1.0
Normalisation efficiency (size of simulation sample)	1.1
Normalisation mode PDF choice	1.0
Total systematic uncertainty	+6.2 -5.9
Total statistical uncertainty	5.9

Conclusion

- Joint measurements of $\mathcal{R}(D)$ and $\mathcal{R}(D^*)$ with D^0 and D^+ :
[LHCb-PAPER-2022-039](#) and [LHCb-PAPER-2024-007](#)
- D^0 update with Run 2 data ongoing
- Hadronic $\mathcal{R}(D^*)$ updated with partial run 2 data
 - [LHCb-PAPER-2022-052](#)
- Important caveat: measurements assume SM shape+uncertainties for $\bar{B} \rightarrow D^{(*)} \tau^- \bar{\nu}_\tau$
 - Fine for a SM null test
 - If there is non lefthanded vector new physics, measurements of $\mathcal{R}(D^{(*)})$ no longer valid
- Much more to come!
