CVMFS@GSI

Tuesday 17 September 2024 17:25 (15 minutes)

GSI is and has been operating a cvmfs instance for many years.
It is used primarily to make prerequisites for physics simulations and analysis of GSI and future FAIR experiments available on our compute cluster.
These include items such as precompiled executables, Spack packages, as well as Apptainer images.
The current cvmfs setup at GSI will be outlined in this talk.
