(christophe.grojean@desy.de)

— on behalf of the FCC team —

Future Circular Collider

- A versatile particle collider housed in a 91km underground ring
- Implemented in several stages:
 - an e^+e^- “Higgs/EW/Flavour/top/QCD” factory running at 90-365 GeV  **FCC-ee**
 - followed by a high-energy pp collider reaching 100 TeV  **FCC-hh**

Outline

1. Why do we need a new collider?
2. FCC feasibility study
3. FCC-ee: overview of physics programme
4. FCC-ee/hh as a Higgs/electroweak factory
5. FCC-ee as a flavour factory
6. FCC-hh: the broadest exploration potential at high-energy
7. FCC-ee↔FCC-hh: complementarity and synergy
8. Conclusion

1.
Why do we need a new collider?

The LHC Legacy (so far).

- ▶ **Standard Model (SM) confirmed to high accuracy up to energies of several TeV**
(thanks to a firm control of exp. & th. syst. uncertainties, the LHC became a precision machine)
- ▶ **Higgs boson discovered** at the mass predicted* by LEP precision EW measurements

*within the Standard Model

- ▶ **Absence of new physics**

TeV-scale Naturalness might not explain DM/baryogenesis

Traditional New Physics models are under siege

New approaches: relaxion, Nnaturalness, clockwork...

Cosmology might settle the vacuum of the SM

We need a broad, versatile and ambitious programme that

1. sharpens our knowledge of already discovered physics
 2. pushes the frontiers of the unknown at high and low scales
- together FCC-ee & FCC-hh combine these 2 aspects —

more **PRECISION** and more **ENERGY**, for more **SENSITIVITY** to New Physics

Precision as a discovery tool.

Many historical examples

- ▶ Uranus anomalous trajectory \rightarrow Neptune
- ▶ Mercury perihelion \rightarrow General Relativity
- ▶ Z/W interactions to quarks and leptons \rightarrow Higgs boson
- ▶ ...

Sometimes, these discoveries were expected based on theoretical arguments
(e.g. Rayleigh-Jeans UV catastrophe for QM, unitarity breakdown for the Higgs)
but precision gave valuable additional clues.

In any case, experimentalists shouldn't lean too heavily on theorist priors/prejudices
(remember discovery of CP violation).

At times when we don't have a precise theoretical guidance, we need powerful experimental tools to make progress.

The FCC project offers unprecedented opportunities on many different fronts.
No LHC/SSC-like **no-lose theorem** but a **promise** of making significant
steps forward in our understanding of the fundamental laws of Nature.

The Higgs requires more precision.

“The Higgs isn’t everything; it’s the only thing!”*

The scalar discovery in 2012 has been an important milestone for HEP.

Many of us are still excited about it. Others should be too.

Higgs = **new forces** of different nature than the interactions known so far

- No underlying local symmetry.
- No quantised charges.
- Deeply connected to the space-time vacuum structure.

— The discovery of the Higgs opens new deep questions —

- What is the origin of the Higgs boson?
- Is it elementary and isolated, or does it emerge from a deeper underlying dynamics?
- Which role did the Higgs play during the big bang, and how did it influence the evolution of the Universe?
- Does the Higgs boson play a role in explaining other fundamental open questions in particle physics which the SM cannot address (flavour, DM, baryogenesis, inflation...)

The Higgs requires more precision.

(HL)-LHC will make remarkable progress.
But it won't be enough.
A new collider is needed!

The knowledge of the values of the **Higgs couplings** is essential to understand the deep structure of matter/Universe:

$m_W, m_Z \leftrightarrow$ Higgs couplings
↑
lifetime of stars
(why $t_{\text{Sun}} \sim t_{\text{life evolution}}$?)

$m_e, m_u, m_d \leftrightarrow$ Higgs couplings
↙ ↘
size of atoms nuclei stability

EWSB @ $t \sim 10^{-10}\text{s} \leftrightarrow$ Higgs self-coupling(s)
? Higgs(es) potential

matter/anti-matter \leftrightarrow CPV in Higgs sector
?

2. FCC feasibility study

The launch of the feasibility study.

“An **electron-positron** Higgs factory is the highest-priority next collider. For the longer term, the European particle physics community has the ambition to operate a **proton-proton** collider at the highest achievable energy.”

— CERN council approved the Strategy and CERN management implemented it —
FCC Feasibility Study (FS) started in 2021 and will be completed in 2025.

Mid-term review in 2023.

FCC feasibility mid-term report.

- **703 pages:** 7 chapters (cost and financial feasibility is a separate document) + refs.

- Placement scenario (75 pages)
- Civil engineering (50 pages)
- Implementation with the host states (45 pages)
- Technical infrastructure (110 pages)
- FCC-ee collider design and performance (170 pages)
- FCC-hh accelerator (60 pages)
- (Cost and financial feasibility)
- Physics and experiments (110 pages)
- References (70 pages)

- **Executive summary:** 44 pages

Edited by:

B. Auchmann, W. Bartmann, M. Benedikt, J.P. Burnet, P. Craievich,
M. Giovannozzi, C. Grojean, J. Gutleber, K. Hanke, P. Janot, M. Mangano,
J. Osborne, J. Poole, T. Raubenheimer, T. Watson, F. Zimmermann

This project has received funding under the European Union's
Horizon 2020 research and innovation programme under grant
agreement No 951754.

This document has been produced by the organisations participating in the
FCC feasibility study. The studies and technical concepts presented here
do not represent an agreement or commitment of any of CERN's Member
States or of the European Union for the construction and operation of an
extension to CERN's existing research infrastructures.

The midterm report of the FCC Feasibility Study reflects work in progress
and should therefore not be propagated to people who do not have direct
access to this document.

1 Overview	54
1.1 FCC-ee	54
1.2 FCC-hh	55
2 Specificities	56
2.1 FCC-ee	58
2.2 FCC-hh	64
2.3 FCC-ee/hh	73
2.4 FCC-ee/hh as a Higgs/electroweak factory	78
3 Theoretical potential	88
3.1 FCC-ee: much more than a Higgs factory:	93
• precision for discovery	93
• tera-Z direct discovery potential	96
3.2 FCC-ee/hh as a Higgs/electroweak factory	98
3.3 FCC-ee as a flavour factory	99
3.4 FCC-hh: the broadest exploration potential at high-energy	101
4 FCC-ee ↔ FCC-hh: complementarity and synergy	103
5 Machine-Detector Interface (MDI)	104
5.5 Machine-Detector Interface (MDI)	104
5.6 Physics Programme	105
5.7 FCC-hh	106

— Main physics topics covered/discussed in the report —

1. FCC-ee: much more than a Higgs factory:
 - precision for discovery
 - tera-Z direct discovery potential
2. FCC-ee/hh as a Higgs/electroweak factory
3. FCC-ee as a flavour factory
4. FCC-hh: the broadest exploration potential at high-energy
5. FCC-ee ↔ FCC-hh: complementarity and synergy

Feedback.

Andy **Parker** (SAC chair), Norbert **Holtkamp** (CRP chair), Hugh **Montgomery** (SPC chair), Laurent **Salzarulo** (FC chair), Eliezer **Rabinovici** (Council president)

“many thanks for the work done, congratulations for the results, impressive quality of the study...”

“Financial Committee underlines the need to make the project attractive from the physics viewpoint and takes the view that it would be unfortunate to sacrifice the attractiveness of the physics for the sake of reducing costs.”

“Si j’ai voulu venir là aujourd’hui c’est pour témoigner ma confiance aux équipes et notre volonté, notre ambition de conserver la première place dans ce domaine.”
[“My visit here bears witness to my trust in CERN personnel and France’s will and ambition to keep the leadership in this domain.”]

E. Macron, CERN 16.11.2023

US Statement of Intent

Deirdre Mulligan

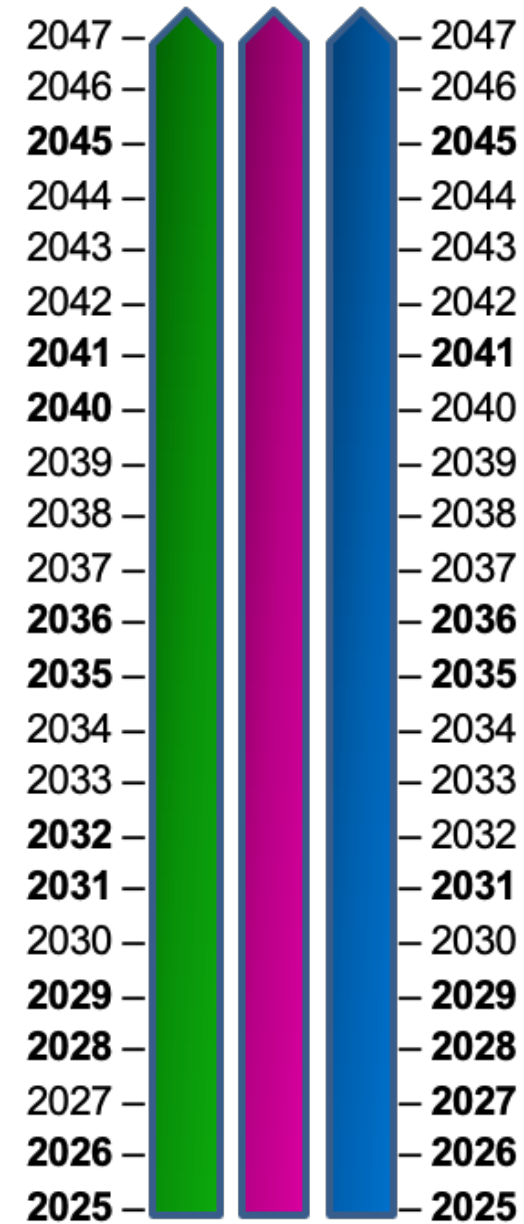

Fabiola Gianotti

“Should the CERN Member States determine the FCC-ee is likely to be CERN’s next world-leading research facility following the high-luminosity Large Hadron Collider, the United States intends to collaborate on its construction and physics exploitation, subject to appropriate domestic approvals.”

White House, April 26, 2024

Collider Programme (and beyond).

— CDR baseline runs (2IPs)
 — Additional opportunities

- **Opportunities** beyond the baseline plan (\sqrt{s} below Z, 125GeV, 217GeV; larger integrated lumi...)
- **Opportunities** to exploit FCC facility differently (to be studied more carefully):
 - using the electrons from the injectors for beam-dump experiments,
 - extracting electron beams from the booster,
 - reusing the synchrotron radiation photons.

FCC-ee: Explore & Discover.

PED @ CERN-SPC 2022

- **EXPLORE INDIRECTLY** the 10-100 TeV energy scale with precision measurements
 - From the correlated properties of the Z , b, c, τ , W, Higgs, and top particles
 - ▶ Up to 20-50-fold improved precision on ALL electroweak observables (EWPO)
 - m_Z , m_W , m_{top} , Γ_Z , $\sin^2 \theta_W^{\text{eff}}$, R_b , $\alpha_{\text{QED}}(m_Z)$, $\alpha_s(m_Z, m_W, m_t)$, top EW couplings ...
 - ▶ Up to 10 × more precise and model-independent Higgs couplings (width, mass) measurements
 - Access the Higgs potential and infer the vacuum structure of the Universe
 - Reveals the dynamics of the EW phase transition and infer the fate of the EW vacuum
- **DISCOVER** that the Standard Model does not fit
 - New Physics! → Pattern of deviations may point to the source.
- **DISCOVER** a violation of flavour conservation / universality
 - $Z \rightarrow \tau \mu$ in 5×10^{12} Z decays; $\tau \rightarrow \mu \nu / e \nu$ in 2×10^{11} τ decays; $B^0 \rightarrow K^{*0} \tau^+ \tau^-$ or $B_S \rightarrow \tau^+ \tau^-$ in 10^{12} bb evts
- **DISCOVER** dark matter, e.g., as invisible decays of Higgs or Z
- **DISCOVER DIRECTLY** elusive (aka feebly-coupled) particles
 - in the 5-100 GeV mass range, such as right-handed neutrinos, dark photons, light Higgs-like scalars, dilaton, ALPs, relaxions...

See Bonus Slides
for examples and plots

FCC-ee: Explore & Discover.

- **ALPs@ colliders**

e.g. $e^+e^- \rightarrow \gamma a$

$e^+e^- \rightarrow ha$

Knapen, Thamm arXiv:2108.08949

Astro/Cosmo → long-lived ALPs
colliders → short-lived ALPs MeV+

4.
FCC-ee/hh as a Higgs/electroweak factory

Higgs @ FCC-ee.

Central goal of FCC-ee: model-independent measurement of Higgs width and couplings with (<) % precision. Achieved through operation at two energy points.

Sensitivity to both processes very helpful in improving precision on couplings.

Complementarity with 365GeV on top of 240GeV
 improvement factor: ∞/3/2/1.5/1.2 on $\kappa_\lambda/\kappa_W/\kappa_b/\kappa_g, \kappa_c/\kappa_\gamma$ (plot in bonus)

Higgs @ FCC-ee.

- Absolute normalisation of couplings (by recoil method)
- Measurement of width (from $ZH \rightarrow ZZZ^*$ and $WW \rightarrow H$)
- $\delta\Gamma_H \sim 1\%$, $\delta m_H \sim 3 \text{ MeV}$ (resp. 25%, 30 MeV @ HL-LHC)
- Model-independent coupling determination and improvement factor up to 10 compared to LHC
- (Indirect) sensitivity to new physics up to 70 TeV (for maximally strongly coupled models)
($\delta\kappa_X = v^2/f^2$ & $m_{\text{NP}} = g_{\text{NP}} f$)
- Unique access to electron Yukawa

— Higgs programme needs Z-pole —

Higgs coupling sensitivity

Coupling	HL-LHC	FCC-ee (240–365 GeV)
		2 IPs / 4 IPs
κ_W [%]	1.5*	0.43 / 0.33
κ_Z [%]	1.3*	0.17 / 0.14
κ_g [%]	2*	0.90 / 0.77
κ_γ [%]	1.6*	1.3 / 1.2
$\kappa_{Z\gamma}$ [%]	10*	10 / 10
κ_c [%]	—	1.3 / 1.1
κ_t [%]	3.2*	3.1 / 3.1
κ_b [%]	2.5*	0.64 / 0.56
κ_μ [%]	4.4*	3.9 / 3.7
κ_τ [%]	1.6*	0.66 / 0.55
$\text{BR}_{\text{inv}} (< \%, 95\% \text{ CL})$	1.9*	0.20 / 0.15
$\text{BR}_{\text{unt}} (< \%, 95\% \text{ CL})$	4*	1.0 / 0.88

Table from mid-term report

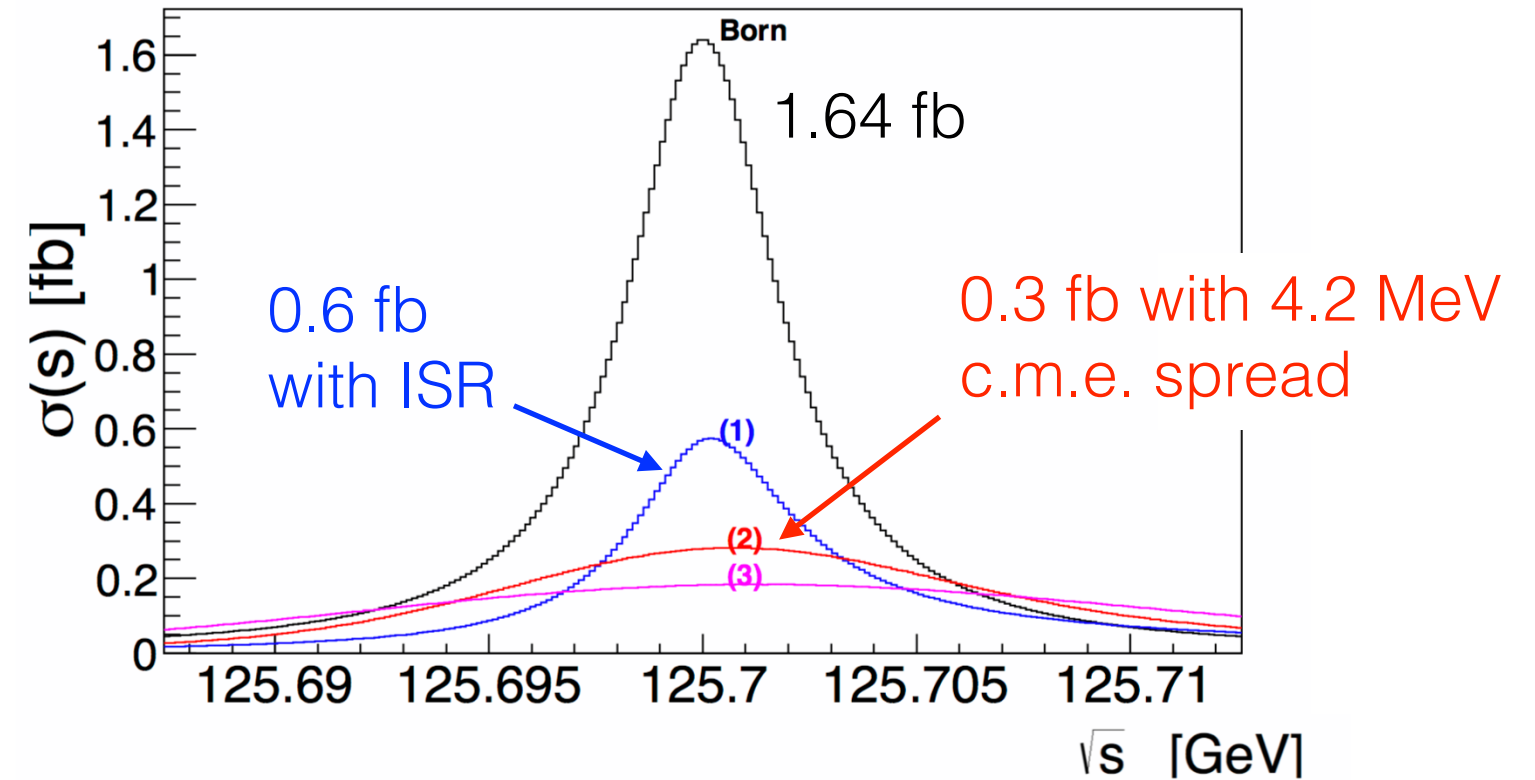

$$\kappa_X = \frac{g_{hXX}}{g_{hXX}^{\text{SM}}}$$

The stuff we are made of: Y_e .

The high luminosity, the precise control of the beam \sqrt{s} , the clean reconstruction of final states make it possible to observe:

Jadach+, arXiv: 1509.02406

$$\sigma(e^+e^- \rightarrow H) = 1.64 \text{ fb}$$

$$\sigma_{\text{spread+ISR}}(e^+e^- \rightarrow H) = 0.17 \times \sigma(e^+e^- \rightarrow H) = 290 \text{ ab}$$

FCC-ee is in the unique position to establish that the Higgs is responsible for the mass of the stable elementary particles ordinary matter is made of.

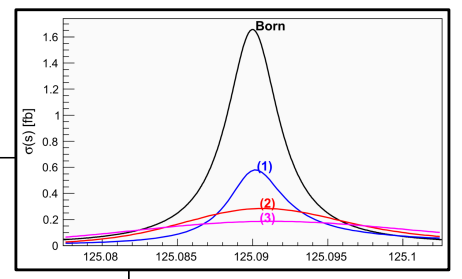

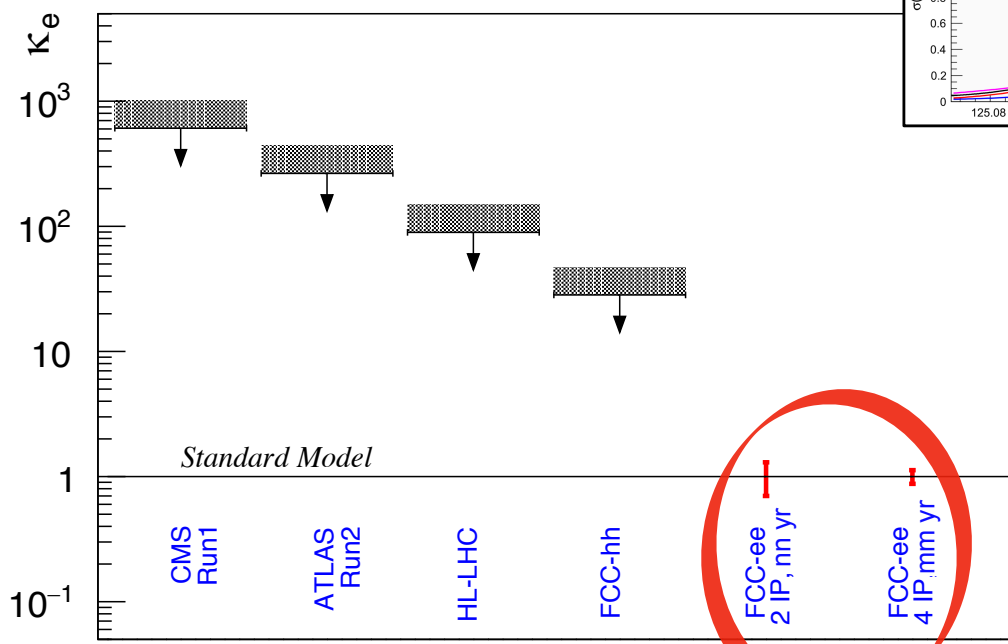

The stuff we are made of: Y_e .

The high luminosity, the precise control of the beam \sqrt{s} , the clean reconstruction of final states make it possible to observe:

- ◆ $20 \text{ ab}^{-1} / \text{year}$ at $\sqrt{s} = 125 \text{ GeV}$ (not in baseline FCC-ee)
- ◆ Monochromatization $\sigma_{\sqrt{s}} \sim 1-2 \times \Gamma_H \sim 6 \text{ to } 10 \text{ MeV}$

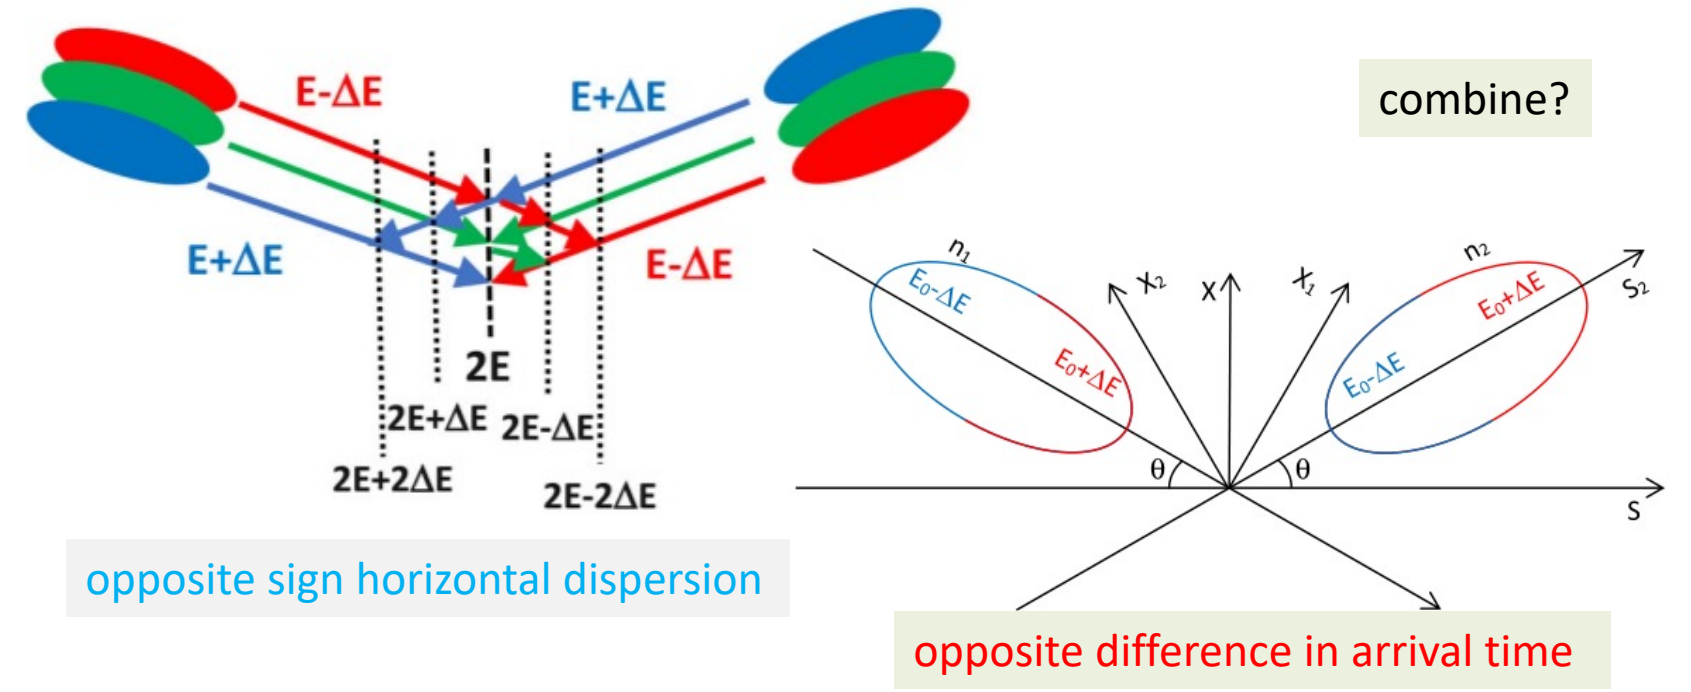

● Resonant $ee \rightarrow H$ production

Upper Limits / Precision on κ_e

Monochromatisation

Monochromatization: **UNDER STUDY**
 taking advantage of the separate e^+ and e^- rings, one can distribute in opposite way high and low energies in the beam (in x, z time)

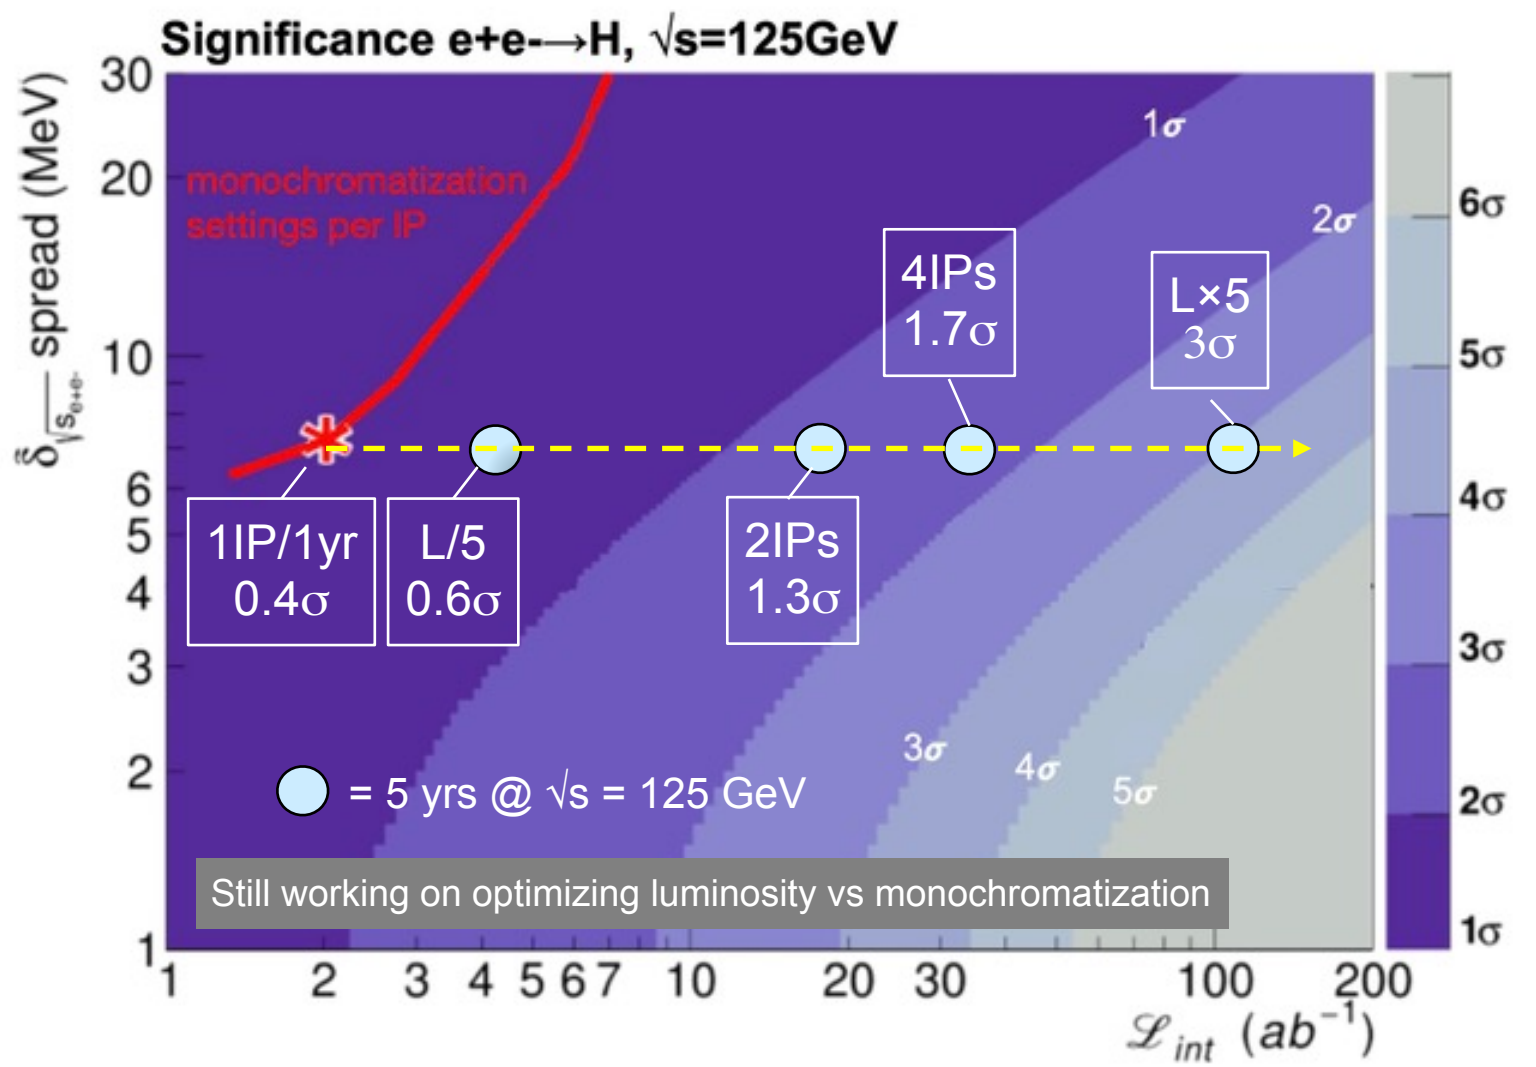

The stuff we are made of: Y_e .

The high luminosity, the precise control of the beam \sqrt{s} , the clean reconstruction of final states make it possible to observe:

- ◆ $20 \text{ ab}^{-1} / \text{year}$ at $\sqrt{s} = 125 \text{ GeV}$ (not in baseline FCC-ee)
- ◆ Monochromatization $\sigma_{\sqrt{s}} \sim 1-2 \times \Gamma_H \sim 6 \text{ to } 10 \text{ MeV}$
 - Resonant $ee \rightarrow H$ production

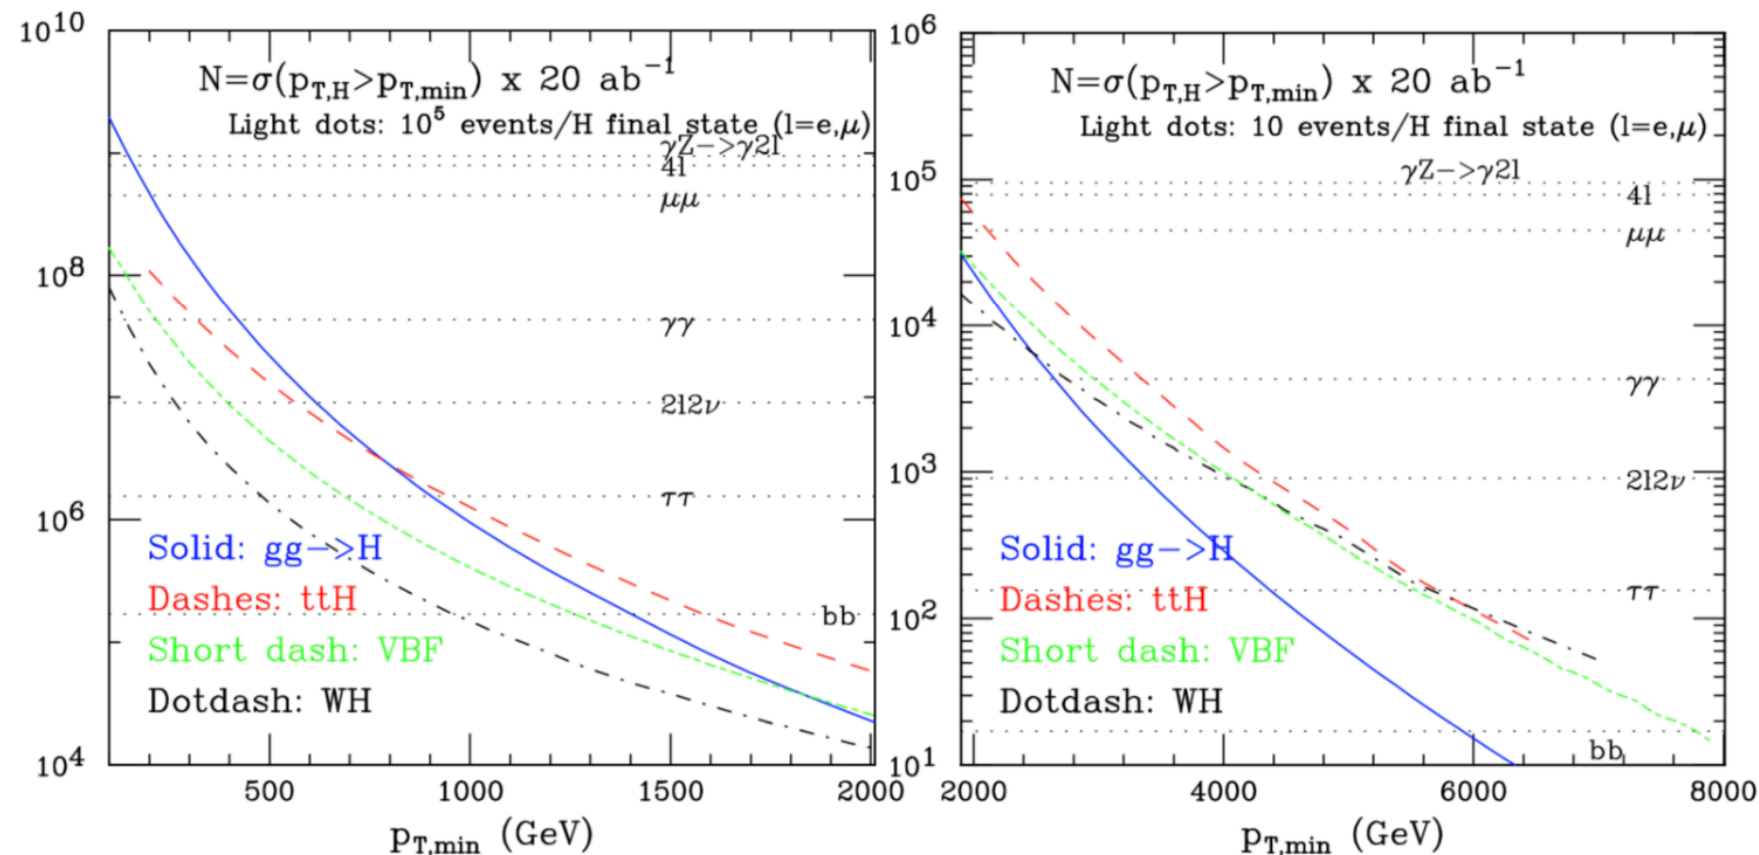

Upper Limits / Precision on κ_e

Higgs @ FCC-hh.

	ggH (N ³ LO)	VBF (N ² LO)	WH (N ² LO)	ZH (N ² LO)	t \bar{t} H (N ² LO)	HH (NLO)
N100	24×10^9	2.1×10^9	4.6×10^8	3.3×10^8	9.6×10^8	3.6×10^7
N100/N14	180	170	100	110	530	390

(N100 = $\sigma_{100 \text{ TeV}} \times 30 \text{ ab}^{-1}$ & N14 = $\sigma_{14 \text{ TeV}} \times 3 \text{ ab}^{-1}$)

- Large rate ($> 10^{10}$ H, $> 10^7$ HH)
 - unique sensitivity to rare decays
 - few % sensitivity to self-coupling
- Explore extreme phase space:
 - e.g. 10^6 H w/ $p_T > 1$ TeV
 - clean samples with high S/B
 - small systematics

Tera-Z EW precision measurements.

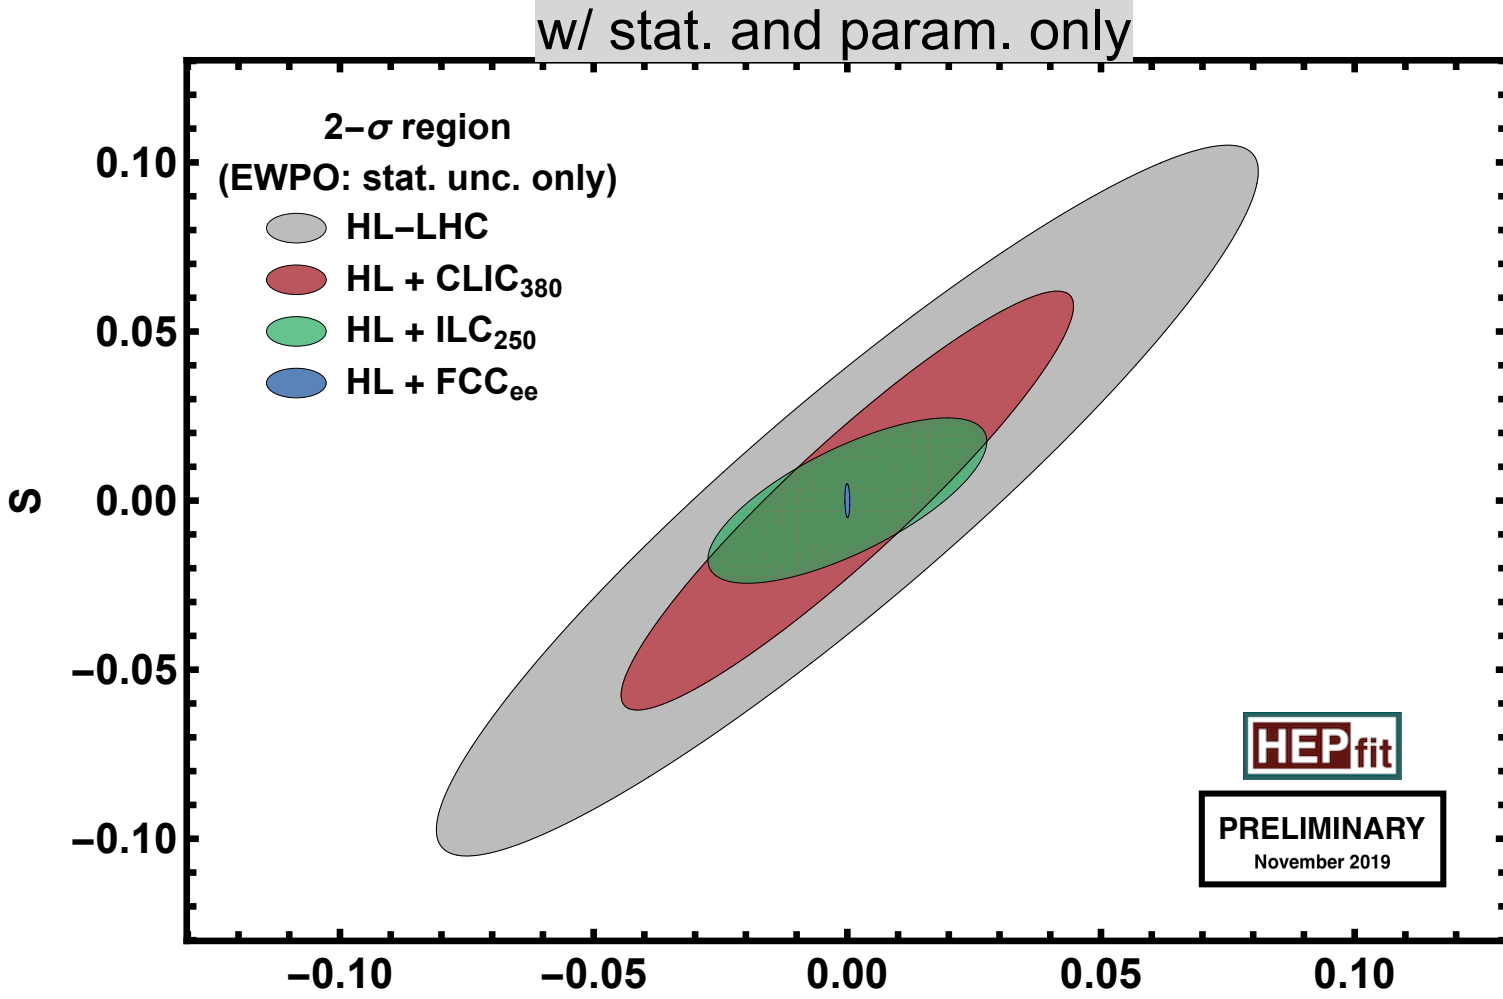

► The target is to reduce syst. uncertainties to the level of stat. uncertainties.
(exploit the large samples and innovative control analyses)

► Exquisite \sqrt{s} precision (100keV@Z, 300keV@WW) reduces beam uncertainties (EPOL)

~50 times better precision than LEP/LSD on EW precision observables

(stat. improvement alone is a factor 300-2'000 so innovative analyses can bring syst. down too)

Indirect sensitivity
to 70TeV-scale sector
connected to EW/Higgs

(For the impact of the theory uncertainties on the EW fit, see bonus slides)

Tera-Z EW precision measurements.

- ▶ The target is to reduce syst. uncertainties to the level of stat. uncertainties.
(exploit the large samples and innovative control analyses)

- ▶ Exquisite \sqrt{s} precision (100keV@Z, 300keV@WW) reduces beam uncertainties (EPOL)

~50 times better precision than LEP/LSD on EW precision observables

(stat. improvement alone is a factor 300-2'000 so innovative analyses can bring syst. down too)

Need TH results to fully exploit Tera-Z

Table from mid-term report

Quantity	Current precision	FCC-ee stat. (syst.) precision	Required theory input	Available calc. in 2019	Needed theory improvement [†]
m_Z	2.1 MeV	0.004 (0.1) MeV	non-resonant	NLO,	NNLO for
Γ_Z	2.3 MeV	0.004 (0.025) MeV	$e^+e^- \rightarrow f\bar{f}$,	ISR logarithms	$e^+e^- \rightarrow f\bar{f}$
$\sin^2 \theta_{\text{eff}}^\ell$	1.6×10^{-4}	$2(2.4) \times 10^{-6}$	initial-state radiation (ISR)	up to 6th order	
m_W	12 MeV	0.25 (0.3) MeV	lineshape of $e^+e^- \rightarrow WW$ near threshold	NLO ($ee \rightarrow 4f$ or EFT framework)	NNLO for $ee \rightarrow WW$, $W \rightarrow f\bar{f}$ in EFT setup
HZZ coupling	—	0.2%	cross-sect. for $e^+e^- \rightarrow ZH$	NLO + NNLO QCD	NNLO electroweak
m_{top}	100 MeV	17 MeV	threshold scan $e^+e^- \rightarrow t\bar{t}$	N ³ LO QCD, NNLO EW, resummations up to NNLL	Matching fixed orders with resummations, merging with MC, α_s (input)

Indirect sensitivity to 70TeV-scale sector connected to EW/Higgs

[†]The listed needed theory calculations constitute a minimum baseline; additional partial higher-order contributions may also be required.

Flavour defines shared (vertexing, tracking, calorimetry) and specific (hadronic PID) detector requirements.

FCC-ee flavour opportunities.

- **CKM element V_{cb}** (critical for normalising the Unitarity Triangle) from WW decays
- **Tau physics** ($>10^{11}$ pairs of tau's produced in Z decays)
 - test of lepton flavour universality: G_F from tau decays @ 10 ppm @ FCC-ee (0.5 ppm from muon decays)
 - lepton flavour violation:
 - $\tau \rightarrow \mu \gamma$: 4×10^{-8} @ Belle2021 $\rightarrow 10^{-9}$ @ FCC-ee
 - $\tau \rightarrow 3\mu$: 2×10^{-8} @ Belle $\rightarrow 3 \times 10^{-10}$ @ BelleII $\rightarrow 10^{-11}$ @ FCC-ee
 - tau lifetime uncertainty:
 - 2000 ppm \rightarrow 10 ppm
 - tau mass uncertainty:
 - 70 ppm \rightarrow 14 ppm
- **Semi-leptonic mixing asymmetries a_{sl}^s and a_{sl}^d**
- ...

6.

FCC-hh: the broadest exploration potential at high-energy

Resonance production.

Protons are made of 5 quarks, gluons, photons, W/Z

FCC-hh effectively collides 196 different initial states = perfect exploratory machine

resonances produced

Plot from mid-term report

FCC-hh mass reach

Plot from FCC CDR

FCC-hh allows the direct exploration of new physics at energy scales up to 40 TeV, including any physics that may be indirectly indicated by precision Higgs and EW measurements at FCC-ee.

Pushing limits of SUSY.

Plot from [arXiv:1606.00947](https://arxiv.org/abs/1606.00947)

Plot from [arXiv:1605.08744](https://arxiv.org/abs/1605.08744) and [arXiv:1504.07617](https://arxiv.org/abs/1504.07617)

Factor 10 increase on the HL-LHC limits.

15-20TeV squarks/gluinos
 require kinematic threshold 30-40TeV:
 FCC-hh is more than a $\sqrt{s} \sim 10\text{TeV}$ factory

7.
Examples of
complementarity & synergy FCC-ee ↔ FCC-hh

Synergy $ee \leftrightarrow hh$.

1 FCC-hh without ee could bound BR_{inv} but it could say nothing about $BR_{untagged}$ (FCC- ee needed for absolute normalisation of Higgs couplings)

FCC-hh is determining top Yukawa through ratio $t\bar{t}h/t\bar{t}Z$

So the extraction of top Yukawa heavily relies on the knowledge of $t\bar{t}Z$ from FCC- ee

K_t (%)

Mangano+ '15

	$\sigma(t\bar{t}H)$ [pb]	$\sigma(t\bar{t}Z)$ [pb]	$\frac{\sigma(t\bar{t}H)}{\sigma(t\bar{t}Z)}$
13 TeV	$0.475^{+5.79\%+3.33\%}_{-9.04\%-3.08\%}$	$0.785^{+9.81\%+3.27\%}_{-11.2\%-3.12\%}$	$0.606^{+2.45\%+0.525\%}_{-3.66\%-0.319\%}$
100 TeV	$33.9^{+7.06\%+2.17\%}_{-8.29\%-2.18\%}$	$57.9^{+8.93\%+2.24\%}_{-9.46\%-2.43\%}$	$0.585^{+1.29\%+0.314\%}_{-2.02\%-0.147\%}$

(uncertainty drops in ratio)

3 Subsequently, the 1% sensitivity on $t\bar{t}h$ is essential to determine h^3 at O(5%) at FCC-hh

Plots from mid-term report

FCC-hh tunnel is great for FCC-ee.

- **80-100 km is needed to accelerate pp up to 100 TeV**
- **80-100 km is also exactly what is needed**
 - to get enough luminosity (5 times more than in 27 km) to maybe get sensitivity to the Higgs self coupling, the electron Yukawa coupling, or sterile neutrinos,
 - to make TeraZ a useful flavour factory,
 - for transverse polarisation to be available all the way to the WW threshold (allowing a precise W mass measurement)
 - for the top threshold to be reached and exceeded.

Conclusions & Outlook

A circular “**Higgs factory**” like FCC-ee has a rich potential:

- * Search directly *&* indirectly for New Physics
- * Establish new organising principles of Nature (LEP→ gauge symmetries, FCC→??)

And FCC-ee is an essential part of an integrated programme to probe the energy frontier.

The FCC project perfectly fits the **needs of HEP after LHC**:

- * guaranteed deliverables & broad exploration potential *

**We have profound questions and we need to create opportunities to answer them.
FCC will for sure contribute.**

Colliders are the most powerful microscopes we have to study Nature at the smallest scales and also from the early moments of the Universe. They'll keep providing a quantitative understanding to progress forward.

Acknowledgement.

This project is supported from the European Union's Horizon 2020 research and innovation programme under grant agreement No 951754.

BONUS

Some work ahead of us.

- Development of a common software and the estimate of the computing needs
- Evaluation of the physics performance and requirements for detectors
- Conceptualisation of detectors capable of delivering these requirements
- Mitigation of the interaction region constraints on detectors and vice versa
- Design of methods and tools for centre-of-mass energy calibration, beam polarisation, and monochromatization
- Understanding and optimisation of the physics program
- Exploration of the physics opportunities
- Development of the theoretical tools and observables needed to meet the measurement targets

FCC feasibility study

Objectives of FCC feasibility study.

- Demonstration of the geological, technical, environmental and administrative feasibility of the tunnel and surface areas and optimisation of placement and layout of the ring and related infrastructure.
- Pursuit, together with the Host States, of the preparatory administrative processes required for a potential project approval to identify and remove any showstopper.
- Optimisation of the design of the colliders and their injector chains, supported by R&D to develop the needed key technologies.
- Elaboration of a sustainable operational model for the colliders and experiments in terms of human and financial resource needs, as well as environmental aspects and energy efficiency.
- Development of a consolidated cost estimate, as well as the funding and organisational models needed to enable the project's technical design completion, implementation and operation.
- Identification of substantial resources from outside CERN's budget for the implementation of the first stage of a possible future project (tunnel and FCC-ee).
- Consolidation of the physics case and detector concepts for both colliders.

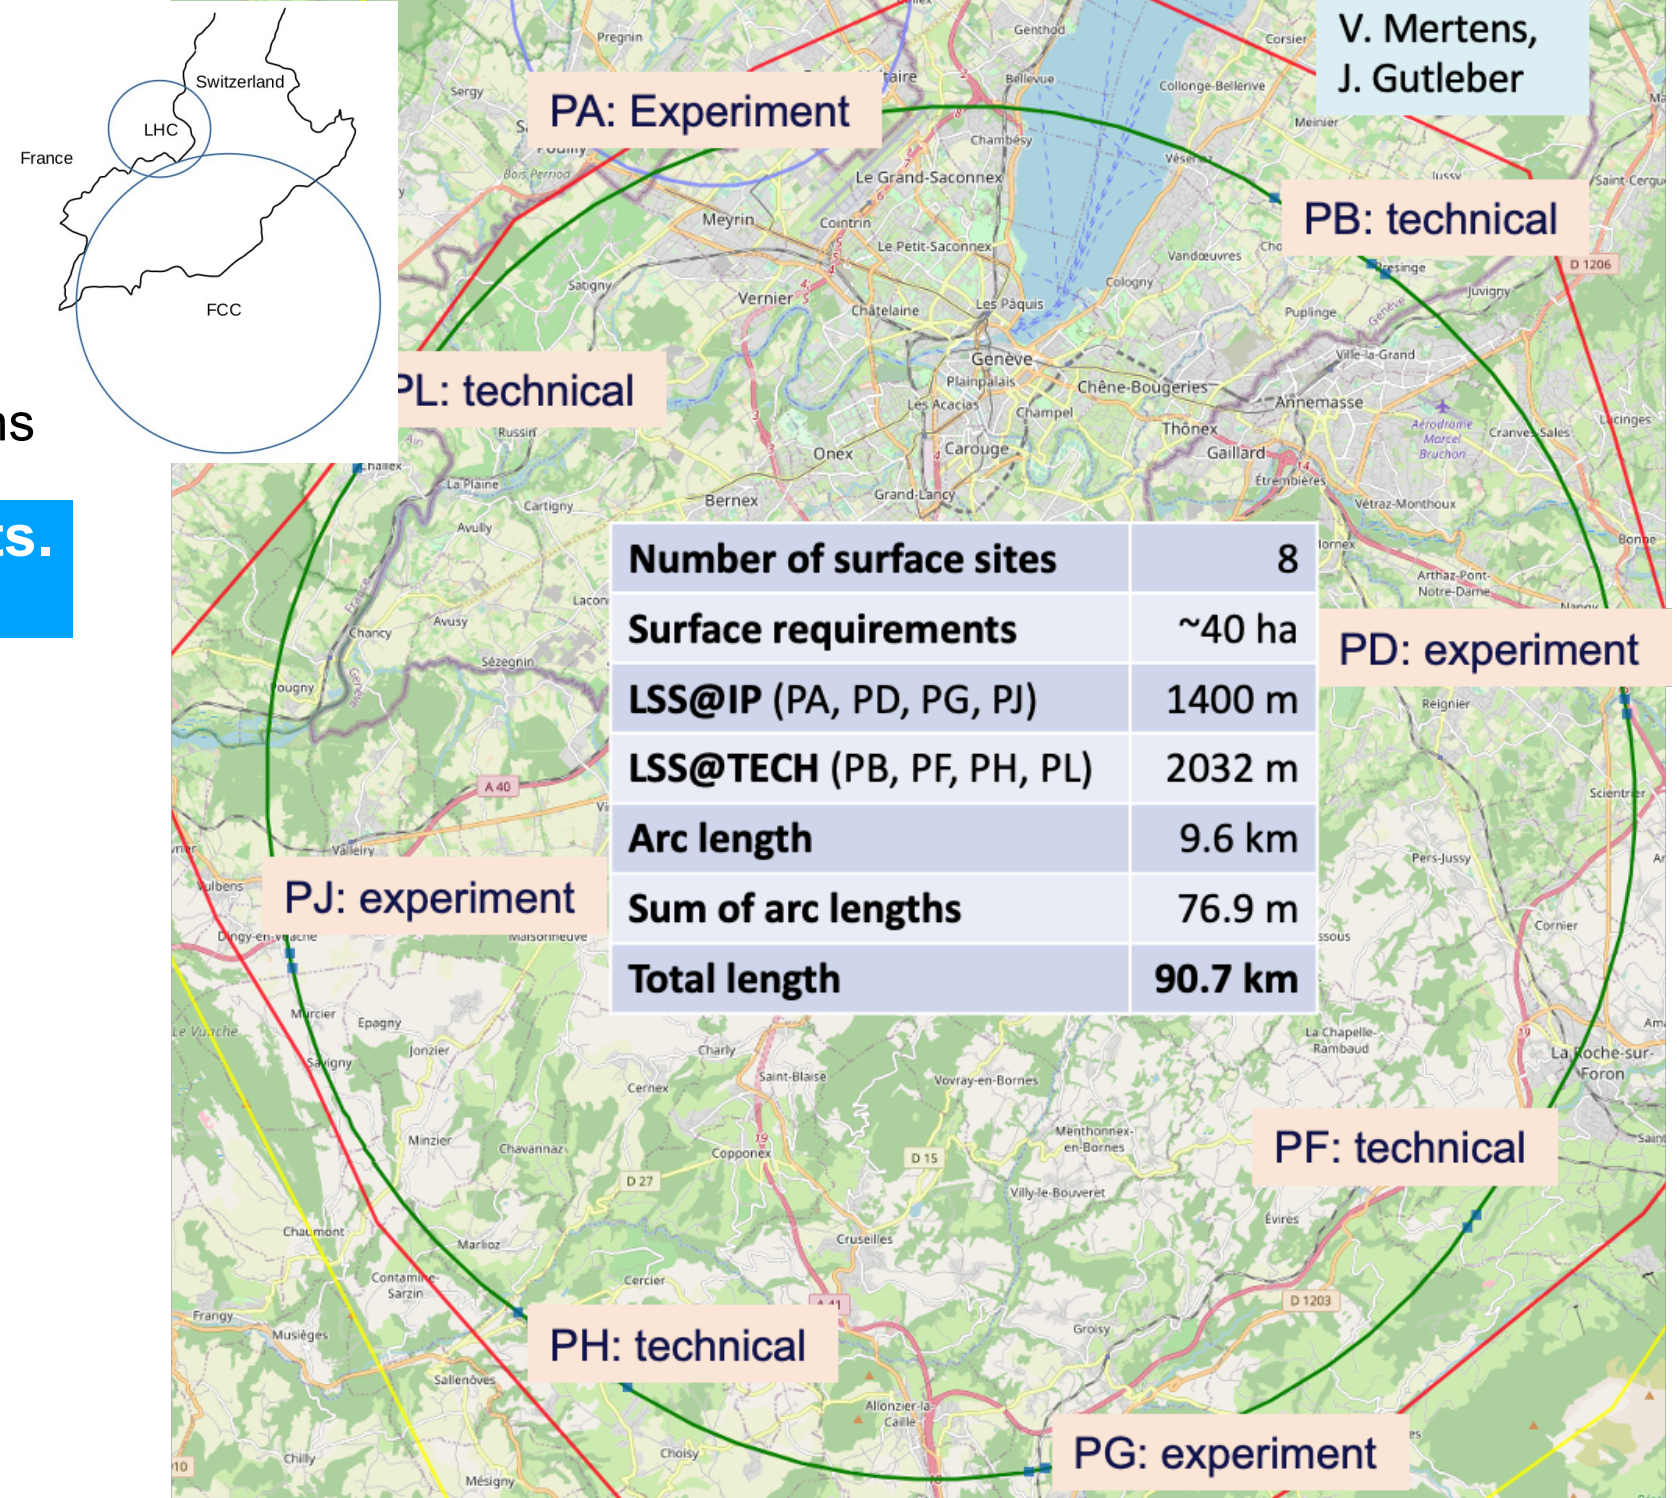

Optimized placement and layout.

M. Benedikt @ CERN 13.02.24

Layout chosen out of ~ 100 initial variants, based on **geology** and **surface constraints** (land availability, access to roads, etc.), **environment**, (protected zones), **infrastructure** (water, electricity, transport), **machine performance** etc.

“Avoid-reduce-compensate” principle of EU and French regulations

Overall lowest-risk baseline: 90.7 km ring, 8 surface points.
Whole project now adapted to this placement

Whole project now adapted to this placement

- **Site investigations in areas with uncertain geological conditions:**

- ▶ Optimisation of localisation of drilling locations ongoing with site visits since end 2022.
- ▶ Alignment with FR and CH on the process for obtaining autorisation procedures. Ongoing for start of drillings in Q2/2024

- **Contracts Status:**

- ▶ Contract for engineering services and role of Engineer during works, active since July 2022
- ▶ Site investigations tendering ongoing towards contract placement in December 2023 and mobilization from January 2024

Environmental considerations.

M. Benedikt @ CERN 13.02.24

- **Excavated material** from FCC subsurface infrastructures: 6.5 Mm³ in situ, 8.4 Mm³ excavated
- **Priority : reuse, minimize disposal**
- 2021-2022: International competition “**Mining the Future**”, launched with the support of the EU Horizon 2020 grant, to find innovative and realistic ideas for the reuse of molasse (96% of excavated materials)
- 2023: “**OpenSky Laboratory**” project: Objective - Develop and test an innovative process to transform sterile “molasse” into fertile soil for agricultural use and afforestation. launched in Jan. 2024: 5500m² near LHC P5 in Cessy (FR). Trial with 5 000t of excavated local molasse → convert it to arable soil (agricultural/forestry)
- **Heat:**
 - heating for local houses
 - cheese factories in Jura and Haute-Savoie expressed special interest

Accelerated soil transformation with funghi

Connections with local infrastructure.

M. Benedikt @ CERN 13.02.24

- **Road accesses** developed for all 8 surface sites
 - ▶ Four possible highway connections defined
 - ▶ Less than 4 km new departmental roads required

- **Connections to electrical grid**

- ▶ Electrical connection concept studied by RTE (French electrical grid operator) → requested loads have no significant impact on grid

- ▶ Powering concept and power rating of the three sub-stations compatible with FCC-hh

- ▶ R&D efforts aiming at further reduction of the energy consumption of FCC-ee and FCC-hh

EW Precision Measurements at FCC-ee

Experimental (statistical and systematic) precision of a selection of measurements accessible at FCC-ee, compared with the present world-average precision. FCC-ee syst. scaled down from LEP estimates. Room for improvement with dedicated studies. Note that syst. go down also with stat. (e.g. beam energy determination from $ee \rightarrow Z/\gamma$ thus goes down with luminosity).

Table from mid-term report

Improvements of EW measurements

Exquisite measurements of m_Z (100 keV), Γ_Z (25 keV), m_W (<500 keV), $\alpha_{\text{QED}}(m_Z)$ ($3 \cdot 10^{-5}$) (all unique to FCC-ee)

w/. stat.+ param. + th-exp syst.

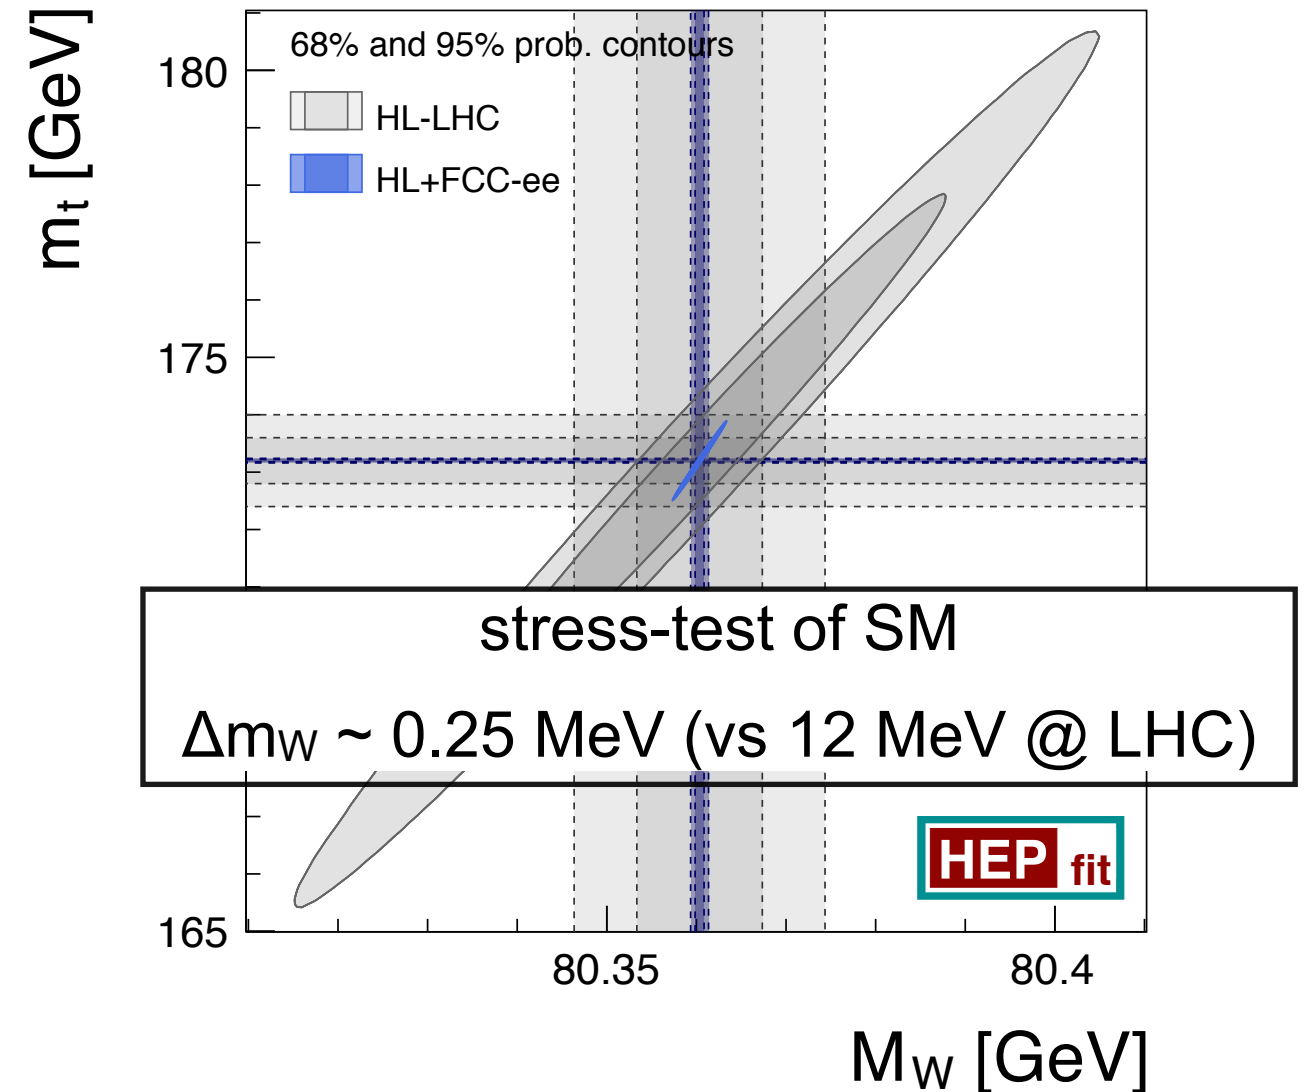

The importance of improved EW measurements is threefold:

- 1) improve mass reach in indirect search for NP ($S \sim 10^{-2} \rightarrow M \sim 70$ TeV)
- 2) reduced parametric uncertainties for other measurements
- 3) reduced degeneracies in a global fit for Higgs couplings

Improvements of EW measurements

Exquisite measurements of m_Z (100 keV), Γ_Z (25 keV), m_W (<500 keV), $\alpha_{\text{QED}}(m_Z)$ ($3 \cdot 10^{-5}$) (all unique to FCC-ee)

w/ stat. and param. only

The importance of improved EW measurements is threefold:

- 1) improve mass reach in indirect search for NP ($S \sim 10^{-2} \rightarrow M \sim 70$ TeV)
- 2) reduced parametric uncertainties for other measurements
- 3) reduced degeneracies in a global fit for Higgs couplings

Systematics vs. Statistics.

PED @ CERN-SPC '2022

- We often hear that more Z pole statistics is useless, because they are systematics-limited
 - ◆ This is a passive attitude, which leads to pessimistic expectations and wrong conclusions/planning
 - Experience shows that a careful experimental systematic analysis boils down to a statistical problem
 - If well prepared, theory will go as far as deemed useful : this preparation starts today (and needs SUPPORT)
 - We are working in the spirit of matching systematic errors to expected statistics for all precision measurements

- ◆ Take the Z lineshape

$\alpha_{\text{QED}}(m_Z)$: Stat. 3×10^{-5}
Obtained at FCC-ee from off-peak asymmetries (87.9 & 94.3 GeV): for the first time, it is a direct measurement of this quantity (game changer)

- Enters as a limiting parametric uncertainties in the new physics interpretation many past and future measurements.
- Is statistics limited and will directly benefit from more luminosity
- No useful impact on $\alpha_{\text{QED}}(m_Z)$ with five times less luminosity

$\sin^2\theta_W^{\text{eff}}$ and Γ_Z (also m_W vs m_Z) : Stat. 2×10^{-6} and 4 keV
Error dominated by point-to-point energy uncertainties.
Based on in-situ comparisons between \sqrt{s} (e.g. with muon pairs), with measurements made every few minutes (100's times per day)
Boils down to

- statistics (the more data the better, scales down as $1/\sqrt{L}$)
- detector systematics (uncorrelated between experiments, scales down a $1/\sqrt{N_{\text{experiments}}}$)

- ◆ Most of the work is (will be) on systematics
 - But huge statistics will turn into better precision
→ A real chance for discovery

Z (and W) mass: Stat. 4 keV (250 keV)
Error dominated by \sqrt{s} determination with resonant depolarization.
As more understanding is gained, progress are made at a constant pace, and this error approaches regularly the statistical limit

Impact of TH uncertainties.

J. de Blas, FCC CDR overview '19

	Current		FCCee		
	Exp.	SM	Exp.	SM (par.)	SM (th.)
δM_W [MeV]	± 15	± 8	± 1	$\pm 0.6/\pm 1$	± 1
$\delta \Gamma_Z$ [MeV]	± 2.3	± 0.73	± 0.1	± 0.1	± 0.2
$\delta \mathcal{A}_\ell$ [$\times 10^{-5}$]	± 210	± 93	± 2.1	$\pm 8/\pm 14$	± 11.8
δR_b^0 [$\times 10^{-5}$]	± 66	± 3	± 6	± 0.3	± 5

Some EW measurements @ Tera

measure $\sigma(e^+e^- \rightarrow \mu^+\mu^-)$ and $A_{FB}^{\mu\mu}$ at (a) judicious \sqrt{s}

The γ exchange term is proportional to $\alpha_{QED}^2(\sqrt{s})$
 The Z exchange term is proportional to G_F^2 , hence independent of α_{QED}
 The γZ interference is proportional to $\alpha_{QED}(\sqrt{s}) \times G_F$

strongly depends on \sqrt{s}
direct measurement of $\alpha_{QED}(s)$ at $\sqrt{s} \neq m_Z$
 measure $\sin^2\theta_W$ to high precision

Excellent experimental control of off-peak di-muon asymmetry motivates campaign to collect 50-80 ab^{-1} off peak to gain highest sensitivity to Z- γ interference

$$A_{FB}^{\mu\mu}(s) \simeq \frac{3}{4} \mathcal{A}_e \mathcal{A}_\mu \times \left[1 + \frac{8\pi\sqrt{2}\alpha_{QED}(s)}{m_Z^2 G_F (1 - 4\sin^2\theta_W^{eff})^2} \frac{s - m_Z^2}{2s} \right]$$

Allows for clean determination of $\alpha_{QED}(m_Z^2)$, which is a *critical* input for m_W closure tests (see later).

relative α_{QED} uncertainty with 80 ab^{-1}

This dependence, & location of half-integer spin tunes, guides the choice of off-peak energies: 87.8 & 93.9 GeV.

- Measure $\alpha_{QED}(m_Z^2)$ to 3×10^{-5} rel. precision (currently 1.1×10^{-4})
- Stat. dominated; syst. uncertainties $< 10^{-5}$ (dominated by \sqrt{s} calib)
- Theoretical uncertainties $\sim 10^{-4}$, higher order calcs needed

Impact of Z-pole on Higgs.

J. De Blas et al. 1907.04311

Comparing 3 EW scenarios: LEP/SLD, actual EW measurements, perfect EW measurements

- FCC-ee and CEPC benefit a lot (>50% on HVV) from Z-pole run
- FCC-ee and CEPC EW measurements are almost perfect for what concerns Higgs physics (<10%).

Impact of Z-pole on Higgs.

J. De Blas et al. 1907.04311

Comparing 3 EW scenarios: LEP/SLD, actual EW measurements, perfect EW measurements

- FCC-ee and CEPC benefit a lot (>50% on HVV) from Z-pole run
- FCC-ee and CEPC EW measurements are almost perfect for what concerns Higgs physics (<10%).
- LEP EW measurements are a limiting factor (~30%) to Higgs precision at ILC, especially for the first runs
But EW measurements at high energy (via Z-radiative return) help mitigating this issue

precision reach with different assumptions on $e^+e^- \rightarrow WW$ measurements

Higgs self-coupling.

Higgs self-couplings is very interesting for a multitude of reasons
(vacuum stability, hierarchy, baryogenesis, GW, EFT probe...).

How much can it deviate from SM given the tight constraints on other Higgs couplings?
Do you need to reach HH production threshold to constrain h^3 coupling?

ECFA Higgs study group '19

Large self-coupling scenarios.

Generically: $\left| \frac{\delta_{h^3}}{\delta_{\text{single } h}} \right| \sim O(1)$ (composite Higgs/susy)

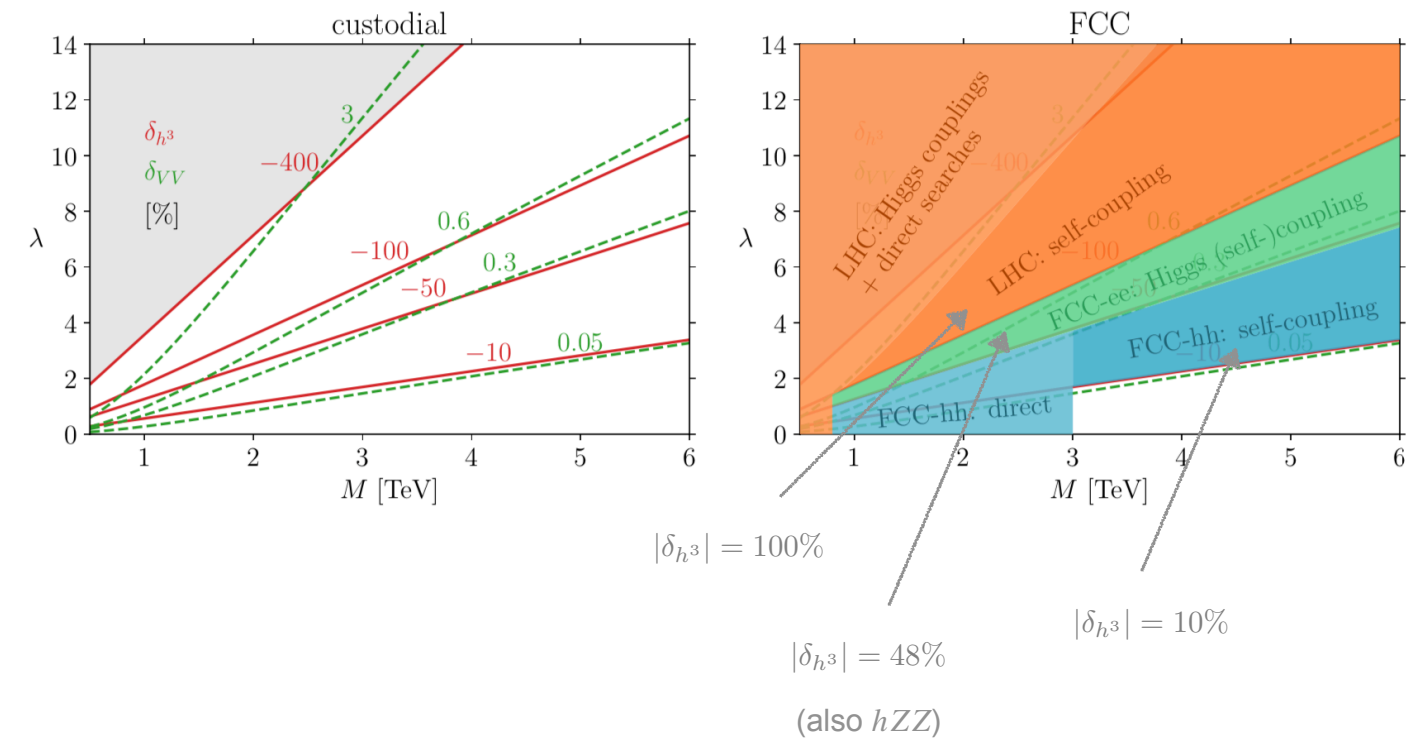

Particular exceptions: Higgs DM-portal models or custodial EW quadruplet

DiVita et al.: 1704.01953

Falkowski, Rattazzi: 1902.05936

Durieux, McCullough, Salvioni: 2209.00666

h^3 generically is not a tool to discover BSM but exceptions exist.

Other exceptions: non-decoupled/fine-tuned spectra

Bahl, Braathen, Weiglein: 2202.03453

Large self-coupling scenarios.

It is true that we haven't "measured" the Higgs potential but there are only peculiar physics scenarios that produce large deviations in the shape of the potential without leaving imprints elsewhere.

R. Petrossian-Byrne/N. Craig @ LCWS'23

Important to understand which dynamics is really probed when embarking into challenging measurements. Actually, double Higgs production is also interesting to probe new physics in its tail rather than near threshold (where the sensitivity to Higgs self-coupling comes from).

Higgs self-coupling.

ECFA Higgs study group '19

1

Don't need to reach HH threshold to have access to h^3 .
Z-pole run is very important if the HH threshold cannot be reached

2

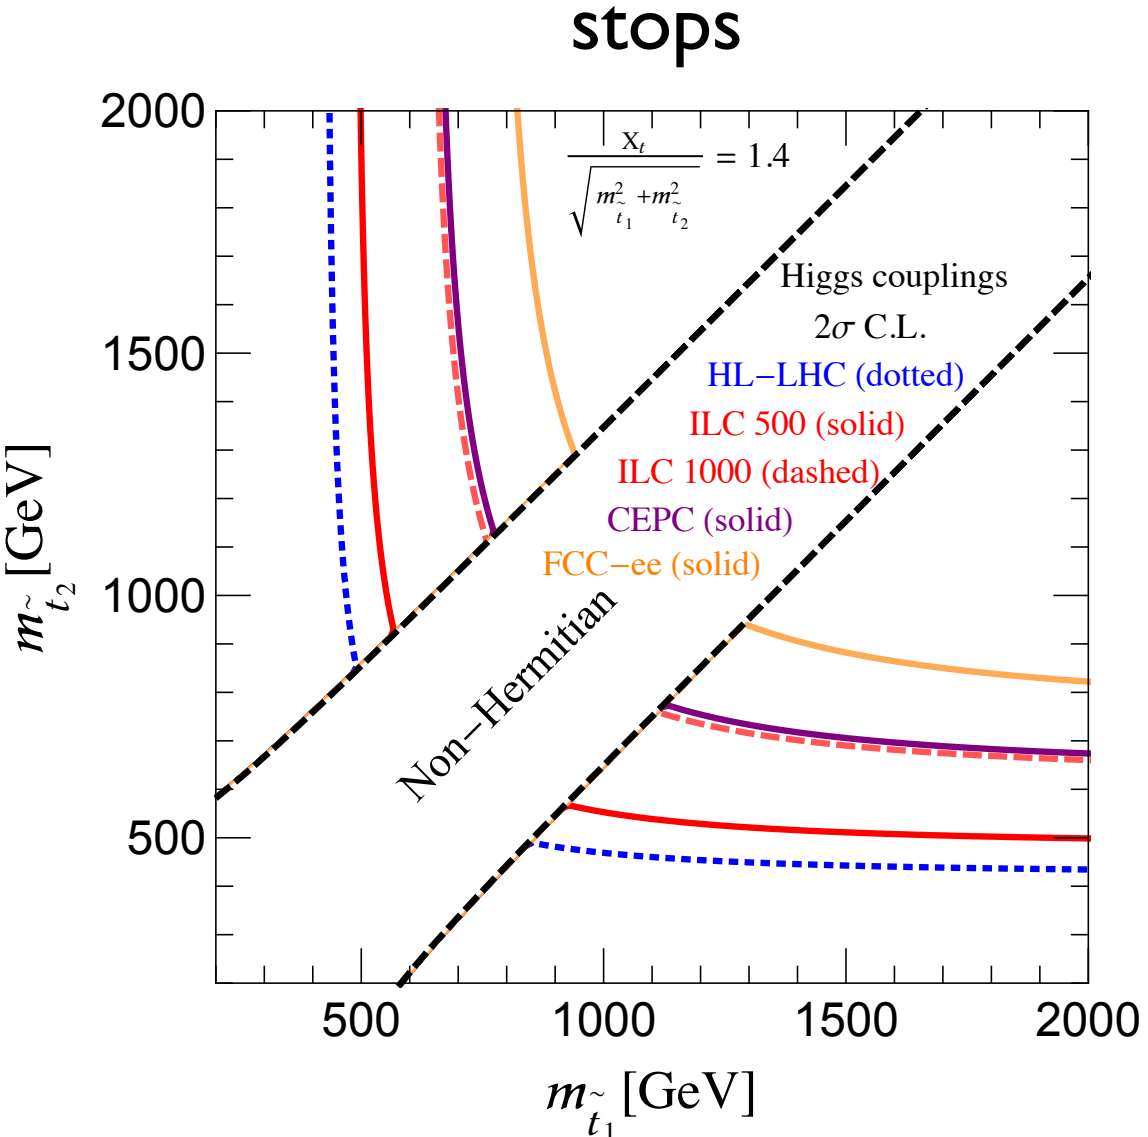

The determination of h^3 at FCC-hh relies on HH channel, for which FCC-ee is of little direct help. But the extraction of h^3 requires precise knowledge of y_t .
 $1\% y_t \leftrightarrow 5\% h^3$
Precision measurement of y_t needs ee

50% sensitivity: establish that $h^3 \neq 0$ at 95%CL
20% sensitivity: 5σ discovery of the SM h^3 coupling
5% sensitivity: getting sensitive to quantum corrections to Higgs potential

Cost of Operation

Energy and carbon footprint.

FCC-ee total instantaneous power demand at each centre-of-mass energies

J.-P. Burnet, FCC Week'22

		Z	W	H	TT	
Beam energy (GeV)		45.6	80	120	182.5	
Magnet current		25%	44%	66%	100%	
Power ratio		6%	19%	43%	100%	
PRF EL (MW)	Storage	146	146	146	146	← Ongoing R&D
PRFb EL (MW)	Booster	2	2	2	2	
Pcryo (MW)	all	1,3	12,6	15,8	47,5	← Ongoing R&D
Pcv (MW)	all	33	34	36	40.2	
PEL magnets (MW)	Stroage	6	17	39	89	↓ Potential energy savings
PEL magnets (MW)	Booster	1	3	5	11	
Experiments (MW)	Pt A & G	8	8	8	8	
Data centers (MW)	Pt A & G	4	4	4	4	
General services (MW)		36	36	36	36	
Power during beam operation (MW)		237	262	291	384	

◆ At 240 GeV, the instantaneous power of FCC-ee amounts to 291 MW

● As a comparison, $P(\text{ILC}_{250})=140$ MW, $P(\text{CLIC}_{380})=110$ MW : less power hungry than FCC-ee?

➔ Not clear: both produce (2 to 4 times) less Higgs than FCC-ee_{240} , with (3 to 6 times) longer running time

Energy and carbon footprint.

- **Our first responsibility (as particle physicists) is to do the maximum of science**
 - ◆ **With the minimal energy consumption and the minimal environmental impact for our planet**
 - Should become one of our top-level decision criteria for design, choice and optimization of a collider
- **All Higgs factories have a “similar” physics outcome (ESU’20 and Snowmass’21)**
 - ◆ **Natural question: what is their energy consumption or carbon footprint for the same physics outcome?**
 - Circular colliders have a much larger instantaneous luminosity and operate several detectors
 - FCC-ee is at CERN, where electricity is already almost carbon-free (and will be even more so in 2048)

Cost of Operation.

The total electrical energy consumption over the fourteen years of the FCC-ee research programme is estimated to be around 27 TWh [58], corresponding to an average electricity consumption of 1.9 TWh/year over the entire operation programme, to be compared with the 1.2 TWh/year consumed by CERN today and the expected 1.4 TWh/year for HL-LHC⁹. At the CERN electricity prices from 2014/15, the electricity cost for FCC-ee collider operation would be about 85 MEuro per year. In the HZ running mode, about one million Higgs bosons are expected to be produced in three years, which sets the price of each FCC-ee Higgs boson at 255 Euros. A similar exercise can be done for the first stage of CLIC, expected to consume 0.8 TWh/year over 8 years at 380 GeV to produce about 150,000 Higgs bosons, which sets the price of a CLIC Higgs boson at about 2000 Euros. Finally, with the official ILC operation cost in Japan of 330 MEuro per year [10], its 11.5 to 18.5 years of operation (Section 5), and the 500,000 Higgs bosons produced in total, the price of an ILC Higgs boson is between 7,000 and 12,000 Euros, i.e., between 30 and 50 times more expensive than at FCC-ee. These operation costs are summarized in Table 8.

Table 8: Operation costs of low-energy Higgs factories, expressed in Euros per Higgs boson.

Collider	ILC ₂₅₀	CLIC ₃₈₀	FCC-ee ₂₄₀
Cost (Euros/Higgs)	7,000 to 12,000	2,000	255
