

New Physics

in the era of future colliders

Marc Riembau
CERN

Corfu 2024
Workshop on Future Accelerators

This is a personal, hence biased and time-dependent, view on what “*new physics*” means.

I do not claim any original thought, similar things have been said several times

Nature circa 2010:

1 m

10^{-6} m

10^{-10} m

10^{-17} m

Nature in 2024:

The LHC provided the **two** discoveries that transformed this picture:

The discovery of a scalar that can explain the origin of mass

The discovery of a mass gap above the electroweak scale

Both play an equally important role in our current description of Nature

Nature in 2024:

The Standard Model embodies *our* most fundamental understanding of Nature

Nature in 2024:

The Standard Model embodies *our* most fundamental understanding of Nature

It is ridiculous to think it is *the* fundamental description of Nature

Nature in 2024:

The Standard Model embodies *our* most fundamental understanding of Nature

It is ridiculous to think it is *the* fundamental description of Nature

It is ridiculous to think it is *a* fundamental description of Nature

Nature in 2024:

1 m

10^{-6} m

No explanation for flavor structure

Theta_QCD is compatible with zero without apparent reason

Higgs potential metastable

No explanation of matter-antimatter asymmetry

No dark matter candidate

No inflaton candidate

Unknown microscopic origin of neutrino masses

Large hierarchies

Dark energy???

...

The Standard Model

It is ridiculous

It is ridiculous

Understanding of Nature

Nature

Nature

Nature in 2024:

The Standard Model embodies *our* most fundamental understanding of Nature

It is ridiculous to think it is *the* fundamental description of Nature

It is ridiculous to think it is *a* fundamental description of Nature

But it is *a* description

1 m

10^{-6} m

10^{-10} m

10^{-17} m

unknown

New **P**hysics

Order-of-magnitude estimate for future reach:

The LHC has found plenty of new resonances compatible with multiquark states

Both competing explanations have issues:

Apparent per mille fine tuning
Missing partners

Cannot explain prompt production
Not in SU(3) of flavor

In *universal theories*, electroweak force cannot propagate arbitrarily

$$\begin{pmatrix} W & X \\ X & Y \end{pmatrix} > 0$$

$$W > 0, \quad Y > 0, \quad WY - X^2 > 0$$

Best determination of W parameter is from CMS, [\[CMS collab. 2202.06075\]](#)

$$W = -1.2^{+0.5}_{-0.6} \times 10^{-4} !$$

New **P**henomena

N P phenomena

e
w

LHC has revealed many surprising, poorly understood phenomena.
A particularly fascinating one is the long-range correlation in high-multiplicity jets

$$\frac{1}{N_{ch}^j} \frac{dN^{pair}}{d\Delta\phi^*} \propto \sum_{n=1}^{\infty} V_{n\Delta} \cos(n\Delta\phi^*)$$

Collectivity?

Multiparton interactions?

String dynamics?

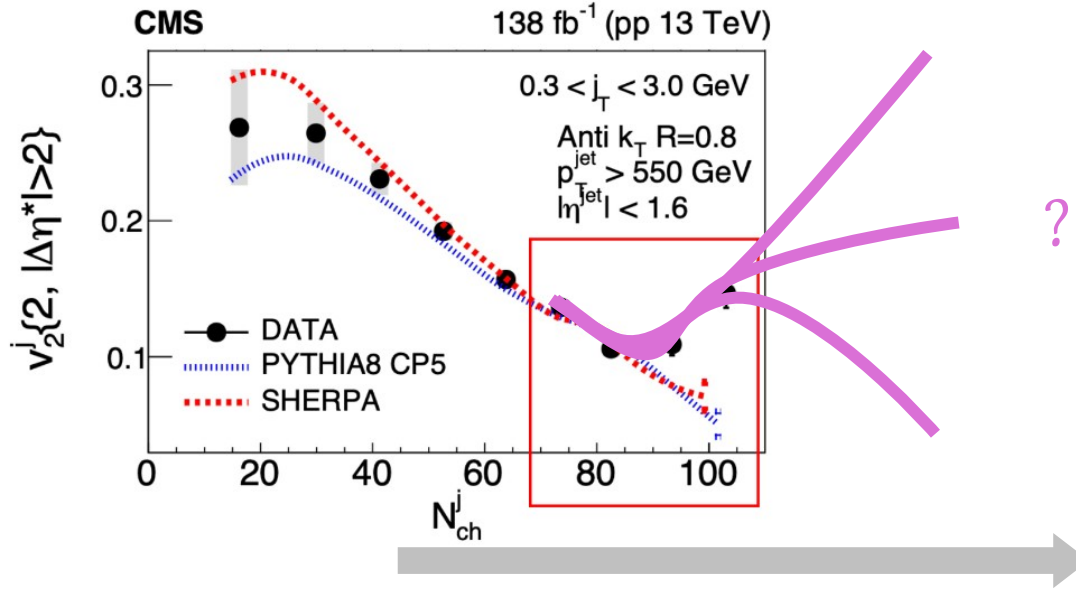

Check the workshop *On the theory interpretation of multi-particle correlations in small collision systems*,
In particular Wei Li's talk [<https://indico.cern.ch/event/1380096/>]

w

Cross sections: rate at which a given state is produced.

$$\sigma(i \rightarrow j) \propto \langle i | \mathcal{M}^\dagger | j \rangle \langle j | \mathcal{M} | i \rangle$$

Can be a very hard question!

Recent resurgence of an old idea:

What is the correlation between energy fluxes at different directions?

$$\langle \mathcal{E}_1 \mathcal{E}_2 \rangle_\chi \propto \sum_\beta \int d\sigma(\alpha \rightarrow \beta) \sum_{i,j \in \beta} E_i E_j \delta(\cos \theta_{ij} - \chi)$$

Theoretically (and experimentally) more robust (e.g. defined in CFTs)

Basham, Brown, Ellis, Love '78

An experimental measure is presented for a precise test of quantum chromodynamics. This measure involves the asymmetry in the energy-weighted opening angles of the jets of hadrons produced in the process $e^+e^- \rightarrow$ hadrons at energy W . It is special for several reasons: It is reliably calculable in asymptotically free perturbation theory; it has rapidly vanishing (order $1/W^2$) corrections due to nonperturbative confinement effects; and it is straightforward to determine experimentally.

$$\frac{d\langle E \rangle}{d\chi} = \sum_i \int d\Omega |\mathcal{A}|^2 E_i \delta(\cos \theta_i - \chi)$$

Summary

New physics is a multifaceted concept, it lies between the known and the unknown

“As long as a branch of science offers an abundance of problems, so long is it alive; a lack of problems foreshadows extinction or the cessation of independent development.”

David Hilbert, 1900 *Mathematical problems*
during the Second International Congress of Mathematicians in Paris

New physics is within each of us
in our ability to ask good, relevant questions
when explaining what we see
