

# Froggatt-Nielsen models meet the SMEFT

Eetu Loisa

DAMTP, University of Cambridge

5 June 2024

# Motivation

**The flavour puzzle:** What explains the dramatic hierarchies in fermion masses and mixings?

Patterns especially clear in the quark sector.

Quark masses:

$$\frac{m_u}{m_t} \sim 10^{-5}$$

CKM elements:

$$V_{\text{CKM}} \approx \begin{pmatrix} 1 & 0.2 & 0.004 \\ 0.2 & 1 & 0.04 \\ 0.009 & 0.04 & 1 \end{pmatrix}$$

$$\Rightarrow V_{11} \gg V_{21} \gg V_{31}$$

# Yukawa sector of the SM

$$\mathcal{L} \supset y_{ij} \bar{\psi}_i H \psi_j \longrightarrow \frac{y_{ij} v_H}{\sqrt{2}} \bar{\psi}_i \psi_j$$

Two ingredients:

1. The Higgs vev  $v_H$
2. Dimensionless Yukawa couplings  $y_{ij}$

The mass hierarchies arise from the Yukawa couplings

Hierarchies in Yukawas could be generated anywhere between  $\mathcal{O}(\text{TeV})$  and  $M_{\text{Planck}}$

**Potential solutions:** introduce new symmetries, fields, extra dimensions, string theory etc.

No clear winner has emerged after decades of work.

# Problems

Too many models available

Many models predict fermion masses by design.  
How to falsify or distinguish between them?

Too much work to put bounds on all the different models.

→ Ideal situation to use the SMEFT.

# Our goals

1. Take a simple model of fermion masses and mixings  $\rightarrow$  Froggatt-Nielsen models
2. Match to the SMEFT
3. Study resulting operator and flavour structure

# Froggatt-Nielsen Models<sup>1</sup>

One of the oldest and simplest models of flavour.

## Setup:

SM fields &  $\mathcal{G}_{\text{SM}} = SU(3)_c \times SU(2)_L \times U(1)_Y$

+ new  $U(1)$  symmetry (global or gauged)

+ heavy flavon field  $\theta$  to break the symmetry

+ unknown UV dynamics: vector-like fermions? We remain agnostic about the details.

---

<sup>1</sup>Froggatt and Nielsen, 1979

# Toy model charge assignments

An example model producing down-quark masses:

Field	$\bar{Q}_1$	$\bar{Q}_2$	$\bar{Q}_3$	$d_1$	$d_2$	$d_3$	$H$	$\theta$
$U(1)_{\text{FN}}$ charge	6	4	0	5	3	3	-3	-2

Which Yukawa-like terms are allowed?

**dim-4:**  $y_{33}^d \bar{Q}_3 H d_3 + y_{32}^d \bar{Q}_3 H d_2$

**dim-5:**  $c_{31}^d \bar{Q}_3 H d_1 \left( \frac{\theta}{\Lambda_{\text{UV}}} \right)$

**dim-6:**  $c_{23}^d \bar{Q}_2 H d_3 \left( \frac{\theta}{\Lambda_{\text{UV}}} \right)^2 + c_{22}^d \bar{Q}_2 H d_2 \left( \frac{\theta}{\Lambda_{\text{UV}}} \right)^2$

## Yukawa sector

$$\mathcal{L} \supset y_{ij}^d \bar{Q}_i H d_j \longrightarrow \mathcal{L} \supset c_{ij}^d \bar{Q}_i H d_j \left( \frac{\theta}{\Lambda_{UV}} \right)^{x_{ij}}$$

Lower generations come with more powers of  $\theta/\Lambda_{UV}$

Flavon takes a vev:

$$\theta = \frac{v_\theta + \vartheta}{\sqrt{2}}$$

Define  $\lambda \equiv \frac{v_\theta}{\sqrt{2}\Lambda_{UV}} \sim 0.1$

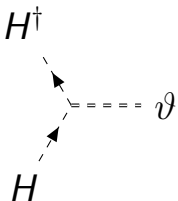

→ Yukawa matrices populated hierarchically.

# Scalar potential

$$V(H, \theta) = -\mu_H^2 H^\dagger H - \mu_\theta^2 \theta^* \theta + \lambda_{20} (H^\dagger H)^2 + \lambda_{02} (\theta^* \theta)^2 + \lambda_{11} \theta^* \theta H^\dagger H$$

After symmetry breaking:

$$\theta = \frac{v_\theta + \vartheta}{\sqrt{2}}$$

$$V(H, \theta) \supset -\lambda_{11} v_\theta \vartheta H^\dagger H \longrightarrow$$

The diagram shows a vertex interaction. On the left, a dashed line labeled  $H^\dagger$  enters from the top, and another dashed line labeled  $H$  enters from the bottom. On the right, a dashed line labeled  $\vartheta$  exits. The lines are connected by a central vertex with arrows pointing towards it.

# Matching strategy

1) Write down a Froggatt-Nielsen EFT up to a given operator dimension. At dimension-4:

$$\mathcal{L}_{\text{FN}} \supset y_{33}^d \bar{Q}_3 H d_3 + y_{32}^d \bar{Q}_3 H d_2 - \lambda_{11} (\theta^* \theta) (H^\dagger H).$$

At dimension-5:

$$\begin{aligned} \mathcal{L}_{\text{FN}} \supset & y_{33}^d \bar{Q}_3 H d_3 + y_{32}^d \bar{Q}_3 H d_2 - \lambda_{11} (\theta^* \theta) (H^\dagger H) \\ & + c_{31}^d \bar{Q}_3 H d_1 \left( \frac{\theta}{\Lambda_{\text{UV}}} \right) \end{aligned}$$

and so on.

2) Break the  $U(1)_{\text{FN}}$  symmetry:

$$\theta = \frac{v_\theta + v^\vartheta}{\sqrt{2}}$$

3) Integrate out  $v^\vartheta$  and match to the SMEFT up to a given operator dimension.

# Technical details

We have obtained our tree-level results manually and loop-level results using Matchete<sup>2</sup> which uses the functional method.

Have manually cross-checked loop-level results using diagrammatic matching.

---

<sup>2</sup>Fuentes-Martin et al., 2212.04510

# Organisation

We need to approach the matching systematically.

We can:

1. Go to higher operator dimensions in  $\mathcal{L}_{\text{FN}}$
2. Go to higher operator dimensions in the SMEFT
3. Match at tree-level, one-loop, two-loop...?

# Organisation

We need to approach the matching systematically.

We can:

1. Go to higher operator dimensions in  $\mathcal{L}_{\text{FN}}$   
 $d_{\text{FN}} = 4, 5$
2. Go to higher operator dimensions in the SMEFT  
 $d_{\text{SMEFT}} = 6$
3. Match at tree-level, one-loop, two-loop...?  
Tree- and one-loop-level

$$d_{\text{FN}} = 4; d_{\text{SMEFT}} = 6; \text{ tree-level}$$

The only non-trivial Lagrangian term comes from the scalar potential:

$$\mathcal{L}_{\text{FN}}^{d=4} \supset y_{33}^d \bar{Q}_3 H d_3 + y_{32}^d \bar{Q}_3 H d_2 - \lambda_{11} \theta^* \theta H^\dagger H$$

After SSB:

$$\begin{aligned} \mathcal{L}_{\text{FN}}^{d=4} \supset y_{33}^d \bar{Q}_3 H d_3 + y_{32}^d \bar{Q}_3 H d_2 \\ - \lambda_{11} v_\theta \vartheta (H^\dagger H) - \frac{\lambda_{11}}{2} \vartheta^2 (H^\dagger H) \end{aligned}$$

Integrate out  $\vartheta$ :

$$\mathcal{L}_{\text{SMEFT}} \supset -\frac{\lambda_{11}^2 v_\theta^2}{2m_\theta^4} (H^\dagger H) \square (H^\dagger H)$$

$$d_{\text{FN}} = 4; d_{\text{SMEFT}} = 6; \text{loop-level}$$

Many more diagrams. E.g.

Matching done by [Jiang et al., 1811.08878](#)  
and [Haisch et al., 2003.05936](#)

$d_{\text{FN}} = 5$ ;  $d_{\text{SMEFT}} = 6$ ; tree-level

$$\mathcal{L}_{\text{FN}}^{d=5} = \mathcal{L}_{\text{FN}}^{d=4} + c_{31}^d \bar{Q}_3 H d_1 \left( \frac{\theta}{\Lambda_{\text{UV}}} \right)$$

After SSB:

$$\mathcal{L}_{\text{FN}}^{d=5} = \mathcal{L}_{\text{FN}}^{d=4} + c_{31}^d \lambda \bar{Q}_3 H d_1 + c_{31}^d \bar{Q}_3 H d_1 \left( \frac{v}{\Lambda_{\text{UV}}} \right)$$

(Recall  $\lambda \sim v_\theta/\Lambda_{\text{UV}} \sim 0.1$ )

# Matching

$$\mathcal{L}_{\text{SMEFT}} \supset \frac{\lambda \lambda_{11} c_{31}^d}{m_\theta^2} (H^\dagger H) (\bar{Q}_3 H d_1) + \text{H.c.}$$

$$d_{\text{FN}} = 5; d_{\text{SMEFT}} = 6; \text{loop-level}$$

where

$$C_{Hd}^{11} = \frac{|c_{31}^d|^2 \lambda^2}{64\pi^2 m_\theta^2} (1 + 2\mathbb{L}).$$

(Have defined  $\mathbb{L} = \log \mu^2 / m_\theta^2$ )

# Key findings at 1-loop

Main operator types:

Higgs-enhanced Yukawas:  $(H^\dagger H) \bar{\psi}_i H \psi_j$

Higgs kinetic operators:  $(H^\dagger i \overleftrightarrow{D}_\mu H) (\bar{\psi}_i \gamma^\mu \psi_j)$

4-fermion operators:  $(\bar{\psi}_i \psi_j) (\bar{\psi}_k \psi_l)$

Flavour patterns controlled by powers of  $\lambda$

Some operator classes appear at tree-level, others loop-suppressed

## E.g. Higgs kinetic operators

$$C_{Hd}^{ij} \left( H^\dagger i \overleftrightarrow{D}_\mu H \right) (\bar{d}_i \gamma^\mu d_j)$$

with

$$C_{Hd}^{ij} \sim \frac{1}{32\pi^2 m_\theta^2} \begin{pmatrix} 0.1\lambda_{11}^2 & \lambda\lambda_{11} & \lambda\lambda_{11} \\ \lambda\lambda_{11} & -\lambda_{11}^2 & -\lambda_{11}^2 \\ \lambda\lambda_{11} & -\lambda_{11}^2 & -\lambda_{11}^2 \end{pmatrix}$$

Recall:

Field	$d_1$	$d_2$	$d_3$	$\theta$
$U(1)_{\text{FN}}$ charge	5	3	3	-2

# Conclusions

**Goal:** Understand the infrared imprint of Froggatt-Nielsen models.

**Method:** Systematically match a Froggatt-Nielsen EFT to the SMEFT.

**Findings:** Rich flavour structure especially in  $(H^\dagger H)\bar{\psi}_i H\psi_j$ ,  $(H^\dagger i \overleftrightarrow{D}_\mu H)(\bar{\psi}_i \gamma^\mu \psi_j)$  and  $(\bar{\psi}_i \gamma^\mu \psi_j)(\bar{\psi}_k \gamma^\mu \psi_l)$  operators.

Wilson coefficients show hierarchies controlled by  $\lambda$ .

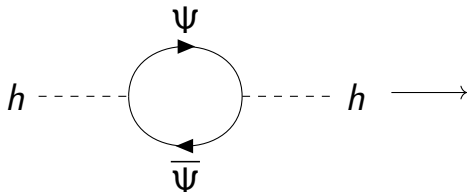

# The End

Thank you for listening!

# Back-up

# UV sensitivity of Yukawas

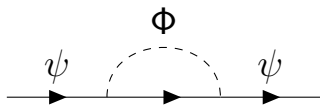

**Note:** The flavour puzzle is different from the *hierarchy problem* concerning the Higgs mass  $m_H^2$ .

A Feynman diagram showing a loop of fermions  $\psi$  and anti-fermions  $\bar{\psi}$ . The loop is connected to two external Higgs boson lines  $h$  via dashed lines. The fermion line is labeled  $\psi$  at the top and  $\bar{\psi}$  at the bottom. The Higgs lines are labeled  $h$  on both sides. An arrow points from the diagram to the equation  $\delta m_H^2 \sim M_\psi^2$ .

$$\delta m_H^2 \sim M_\psi^2$$

versus

A Feynman diagram showing a fermion line  $\psi$  with a self-energy loop of a scalar field  $\phi$ . The fermion line is labeled  $\psi$  at both ends. The scalar loop is labeled  $\phi$  at the top. An arrow points from the diagram to the equation  $\delta m_\psi \sim m_\psi \log(M_\phi/m_\psi)$ .

$$\delta m_\psi \sim m_\psi \log(M_\phi/m_\psi)$$

## Some model predictions

Nir and Seiberg noticed ([hep-ph/9212278](#), [hep-ph/9310320](#)) that FN models necessarily predict e.g.

$$|V_{ub}| \sim |V_{us} V_{cb}|,$$

$$|V_{ij}| \gtrsim \frac{m_{u_i}}{m_{u_j}},$$

$$|V_{ij}| \gtrsim \frac{m_{d_i}}{m_{d_j}}.$$

These relations could fail in nature but they do not.  
→ Promising for FN models.

# Goldstones: a threat or an opportunity?

The flavon field  $\theta$  contains two degrees of freedom

$$\theta = \frac{v_\theta + \vartheta + i\pi}{\sqrt{2}}$$

If  $U(1)_{\text{FN}}$  is a global symmetry, its breaking gives a light (pseudo-)Goldstone boson.

Calibbi et al., 1612.08040 and Ema et al., 1612.05492 identify  $\pi$  as the QCD axion.

Severe constraints on the axion mass and decay constant imply  $v_\theta \gtrsim 10^{14}$  GeV

## Gauged $U(1)_{\text{FN}}$

Introduce a  $Z'$  boson which eats the  $\pi$  component of the scalar field.

The covariant derivatives

$$\mathcal{L} \supset \bar{\psi}_i i \not{D} \psi_i + (D_\mu H)^\dagger (D^\mu H)$$

yield interactions between the SM fields and the  $Z'$ .

Phenomenologically more viable than having a Goldstone.

All potential complications can be removed by assuming we have a *discrete* flavour symmetry instead of a  $U(1)_{\text{FN}}$ .

For the toy model

$$\mathcal{L}_{\text{FN}} \supset -g_{\text{F}} Z'_{\mu} (\Omega_{ij} \bar{d}_i \gamma^{\mu} d_j + \xi_{ij} \bar{Q}_i \gamma^{\mu} Q_j),$$

with two flavour matrices

$$\Omega = \begin{pmatrix} 5 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 3 \end{pmatrix} \quad \text{and} \quad \xi = - \begin{pmatrix} 6 & 0 & 0 \\ 0 & 4 & 0 \\ 0 & 0 & 0 \end{pmatrix}.$$

Integrating out  $Z'$  gives

$$\begin{aligned} \mathcal{L}_{\text{SMEFT}}^{d=6} \supset & -\frac{g_{\text{F}}^2 \Omega_{ij} \Omega_{kl}}{2M_{Z'}^2} (\bar{d}_i \gamma^{\mu} d_j) (\bar{d}_k \gamma_{\mu} d_l) \\ & -\frac{g_{\text{F}}^2 \xi_{ij} \xi_{kl}}{2M_{Z'}^2} (\bar{Q}_i \gamma^{\mu} Q_j) (\bar{Q}_k \gamma_{\mu} Q_l) - \frac{g_{\text{F}}^2 \Omega_{ij} \xi_{kl}}{M_{Z'}^2} (\bar{d}_i \gamma^{\mu} d_j) (\bar{Q}_k \gamma_{\mu} Q_l). \end{aligned}$$

The Higgs covariant derivatives contribute to:

$$\mathcal{L}_{\text{SMEFT}}^{d=6} \supset -\frac{9g_F^2}{2M_{Z'}^2} (H^\dagger H) \square (H^\dagger H) - \frac{18g_F^2}{M_{Z'}^2} (H^\dagger D^\mu H)^* (H^\dagger D_\mu H)$$

Finally, can use the  $Z'$  to “connect” the two covariant derivatives:

$$\mathcal{L}_{\text{SMEFT}}^{d=6} \supset -\frac{3g_F^2 \Omega_{ij}}{M_{Z'}^2} (H^\dagger i \overleftrightarrow{D}_\mu H) (\bar{d}_i \gamma^\mu d_j) \\ - \frac{3g_F^2 \xi_{ij}}{M_{Z'}^2} (H^\dagger i \overleftrightarrow{D}_\mu H) (\bar{Q}_i \gamma^\mu Q_j).$$

# Basics of EFT matching

There are two main ways to match UV theories to EFTs:

## 1) Diagrammatic matching

Require that at low energies, UV theory and EFT give identical scattering amplitudes

$$i\mathcal{A}_{\text{EFT}}(p_i) = i\mathcal{A}_{\text{UV}}(p_i) \quad \text{for } p_i \ll \Lambda_{\text{UV}}$$

Draw UV diagrams with heavy internal lines.  
Expand heavy propagators as

$$\frac{i}{p_i^2 - m_\theta^2} \rightarrow \frac{-i}{m_\theta^2} \left( 1 + \frac{p_i^2}{m_\theta^2} + \dots \right)$$

→ UV diagram captured by local EFT operator

$$C_{dH}^{31}(H^\dagger H)(\bar{Q}_3 H d_1)$$

## 2) Functional matching

Start with UV Lagrangian  $\mathcal{L}_{UV}$  and derive Euler-Lagrange equation for heavy field:

$$\partial_\mu \frac{\delta \mathcal{L}_{UV}}{\delta(\partial_\mu \vartheta)} = \frac{\delta \mathcal{L}_{UV}}{\delta \vartheta}$$

We get

$$\begin{aligned} (\square + m_\theta^2) \vartheta &= -\lambda_{11} v_\theta (H^\dagger H) - \lambda_{11} (H^\dagger H) \vartheta \\ &\quad + \frac{c_{31}}{\Lambda_{UV}} \bar{Q}_3 H d_1 + \dots \end{aligned}$$

Get a recursive equation for  $\vartheta$ :

$$\begin{aligned}\vartheta &= \frac{-\lambda_{11}v_\theta}{\square + m_\theta^2} (H^\dagger H) - \frac{\lambda_{11}}{\square + m_\theta^2} (H^\dagger H)\vartheta \\ &+ \frac{c_{31}}{\Lambda_{UV}(\square + m_\theta^2)} \overline{Q}_3 H d_1 + \dots\end{aligned}$$

Plug back into  $\mathcal{L}_{UV}$  to eliminate  $\vartheta$  from the theory.

The resulting Lagrangian is the EFT.

Diagrammatic and functional methods give identical results.

Both methods extend to loop-level.

Diagrammatically:

The diagram shows a loop with two external lines labeled  $d_1$  (solid arrows) and two external lines labeled  $H$  (dashed arrows). The top arc of the loop is labeled  $Q_3$  and the bottom arc is labeled  $\vartheta$ . To the right of the diagram is the mathematical expression  $\sim \int \frac{d^d k}{(2\pi)^d} (\dots)$ .

The “hard region”  $k^2 \sim m_\theta^2$  of the loop integral gives a contribution to a local EFT operator

$$\longrightarrow C_{Hd}^{11} (H^\dagger i \overleftrightarrow{D}_\mu H) (\bar{d}_1 \gamma^\mu d_1)$$

Functional method at 1-loop is more complicated.

# Functional matching beyond tree-level

The following is copied from [Cohen, Lu and Zhang, 2011.02484](#):

Write fields as  $\varphi = (\Phi, \phi)$  where  $\Phi$  stands for heavy fields.

Matching based on equating 1LPI effective actions of the EFT and UV theory:

$$\Gamma_{\text{EFT}}[\phi] = \Gamma_{\text{L,UV}}[\phi].$$

At tree-level,

$$\mathcal{L}_{\text{EFT}}^{(\text{tree})}[\phi] = \mathcal{L}_{\text{UV}}[\Phi, \phi] \Big|_{\Phi = \Phi_c[\phi]}$$

At 1-loop:

$$\Gamma_{L,UV}^{1\text{-loop}}[\phi] = \Gamma_{L,UV}^{1\text{-loop}}[\phi] \Big|_{\text{hard}} + \Gamma_{L,UV}^{1\text{-loop}}[\phi] \Big|_{\text{soft}}$$

and

$$\Gamma_{\text{EFT}}^{1\text{-loop}}[\phi] = \mathcal{S}_{\text{EFT}}^{1\text{-loop}} + \left( \text{1-loop contributions from } \mathcal{L}_{\text{EFT}}^{(\text{tree})} \right)$$

Second terms in both expressions equal. Get

$$\mathcal{S}_{\text{EFT}}^{1\text{-loop}} = \Gamma_{L,UV}^{1\text{-loop}}[\phi] \Big|_{\text{hard}}$$

How does one evaluate the RHS?

$$\begin{aligned}\mathcal{S}_{\text{EFT}}^{1\text{-loop}} &= \frac{i}{2} \log \text{Sdet} \left( -\frac{\delta^2 \mathcal{S}_{\text{UV}}}{\delta \phi^2} \Big|_{\Phi = \Phi_c[\phi]} \right) \Big|_{\text{hard}} \\ &= \frac{i}{2} \text{STr} \log \mathbf{K} \Big|_{\text{hard}} - \frac{i}{2} \sum_{n=1}^{\infty} \frac{1}{n} \text{Sdet} \left[ (\mathbf{K}^{-1} \mathbf{X})^n \right] \Big|_{\text{hard}}\end{aligned}$$

Truncate at desired order in EFT expansion.
