Introduction: Odderon exchange in elastic pp
Model independent results:
Significance at least 6.26 σ
Model dependent results:
Significance at least 7.08 σ
New results at 8 TeV
1: H(x) scaling
2: ReBB Model vs ATLAS and TOTEM
3: Extended Pomeranchuk theorem

Odderon: extremely elusive, for 48 years

Odderon: L. Lukaszuk, B. Nicolescu,
Lett. Nuovo Cim. 8, 405 (1973)
Received: **31 July 1973**

Odderon is an odd component of
elastic scattering:
Changes sign for crossing

ЛАБОРАТОРИЯ ТЕОРЕТИЧЕСКОЙ ФИЗИКИ

EVIDENCE FOR NEW SINGULARITIES

IN REGGE PHENOMENOLOGY

1972

Odderon name coined: D. Joynson, E. Leader, B. Nicolescu, C. Lopez,
Nuovo Cim. 30A, 345 (1975) - Well established in QCD by now !
Honorable mention: A. V. Efremov, R. Peschanski, JINR-E2-6350 (1972)

Odderon: elusive experimentally

Odderon search at ISR: indication but no conclusive result
Breakstone et al, Phys. Rev. Lett. 54, 2180 (**1985**): CL = 99.9 %

Indication of Odderon
CL = 99.9 %,
Significance: 3.35 σ
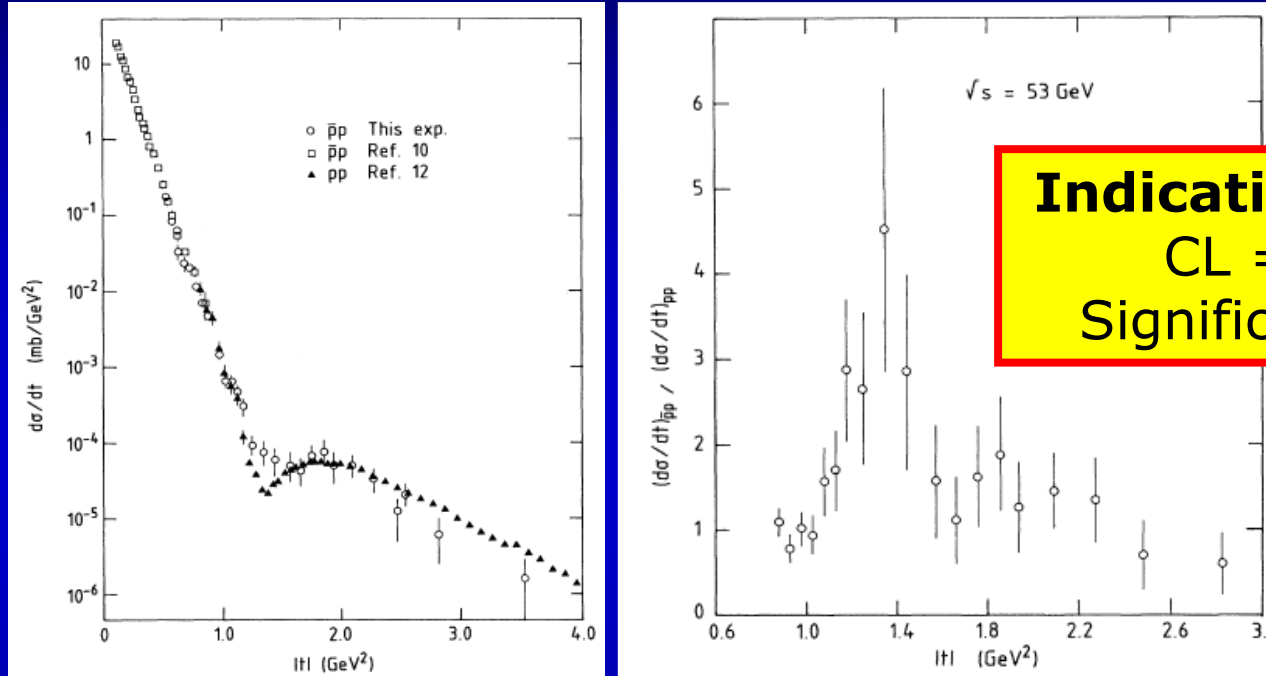

Terminology for **this** talk:
Agreement if statistical significance is < **3 σ**
Indication of signal if **3 σ** ≤ significance < **5 σ**
Evidence or observation of signal if **5 σ** ≤ significance
Discovery of signal if **5 σ** ≤ significance, **for the first time**.
Accepted: Discovery if Clay Mathematical Institute (CMI) criteria satisfied.
Miscovery if CMI criteria for Millenium Prize Problems are **not** satisfied.

Odderon: well established in QCD

Odderon proposed in Regge phenomenology:

α = 0.128
ϵ_{o1} = -0.753 ± 0.137

2.76 TeV

√s=2.76 TeV
- data pp
— reBB p=(q,d) pp extr.

Range: $0.372 \leq -t \leq 0.741$ [GeV²]
χ^2/NDF = 100.35/20 = 5.02
CL = 1.092e-10 %

σ_{tot} = 84.86 [mb]
σ_{in} = 62.72 [mb]
σ_{el} = 22.13[mb]
ρ_0 = 0.140

λ = 0.500
R_q = 0.419 [fm]

7 TeV

√s=7 TeV
- pp data
— reBB p=(q,d) pp extr.

Range: $0.377 \leq -t \leq 1.205$ [GeV²]
χ^2/NDF = 2811.46/56 = 50.20
CL = 0.000e+00 %

σ_{tot} = 94.54 [mb]
σ_{in} = 70.20 [mb]
σ_{el} = 24.34 [mb]
ρ_0 = 0.169

λ = 0.500
R_q = 0.437 [fm]
R_d = 0.919 [fm]
R_{qd} = 0.336 [fm]
A_{qq} = 1.000
α = 0.208
ϵ_{b1} = 2.256 ± 0.138
ϵ_{o1} = -0.649 ± 0.952

With new 8 TeV data:
Model dependent certainty
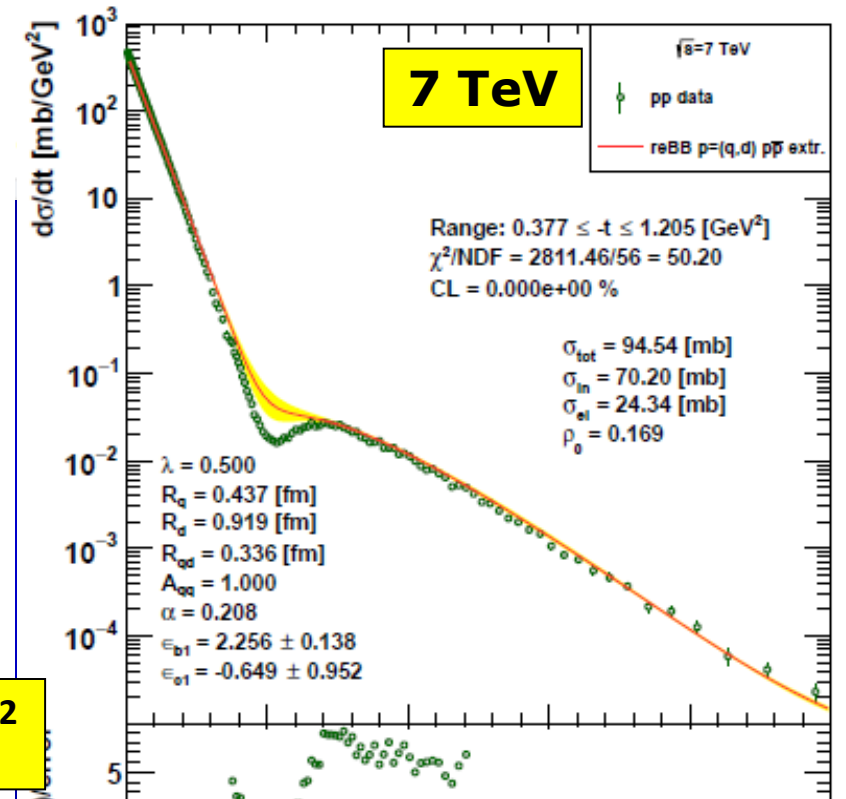

S: Model dependent Odderon significance ≥ 7.08 σ
C1: All D0 and TOTEM published data at 1.96, 2.76, and 7.0 TeV
C2: domain of validity extended to both pp and pbarp
But **limited to** $0.37 \leq -t \leq 1.2$ GeV² and $0.546 \leq$ sqrt(s) $\leq 7 \rightarrow 8$ TeV

Model dependent, Real Extended Bialas-Bzdak theory results,
Odderon significance ≥ 7.08 σ, from 1.96 and 2.76 TeV data only

Formalism: elastic scattering

$$\frac{d\sigma(s)}{dt} = \frac{1}{4\pi}|T_{el}(s,\Delta)|^2, \qquad \Delta = \sqrt{|t|}.$$

$$\sigma_{el}(s) = \int_0^\infty d|t|\frac{d\sigma(s)}{dt}$$

$$A(s) = \lim_{t\to 0}\frac{d\sigma}{dt}(s,t)$$

$$A(s) = \frac{1}{16\pi}(1 + \rho_0^2(s))\sigma_{tot}^2(s)$$

$$B(s,t) = \frac{d}{dt}\ln\frac{d\sigma(s)}{dt}$$

$$\rho(s,t) \equiv \frac{\mathrm{Re}\,T_{el}(s,\Delta)}{\mathrm{Im}\,T_{el}(s,\Delta)}$$

$$B(s) \equiv B_0(s) = \lim_{t\to 0}B(s,t),$$

$$\rho(s) \equiv \rho_0(s) = \lim_{t\to 0}\rho(s,t)$$

$$\sigma_{tot}(s) \equiv 2\,\mathrm{Im}\,T_{el}(\Delta = 0, s)$$

Basic problem: dσ/dt measures an amplitude, *modulus squared*.
If Odderon exists: signals in elastic scattering at t = 0 and at –t > 0.

Formalism in b space

$$\frac{d\sigma(s)}{dt} = \frac{1}{4\pi} |T_{el}(s,\Delta)|^2, \qquad \Delta = \sqrt{|t|}.$$

$$t_{el}(s,b) = \int \frac{d^2\Delta}{(2\pi)^2} e^{-i\Delta b} T_{el}(s,\Delta) =$$

$$= \frac{1}{2\pi} \int J_0(\Delta b) T_{el}(s,\Delta) \Delta d\Delta,$$

$$\Delta \equiv |\boldsymbol{\Delta}|, \quad b \equiv |\boldsymbol{b}|.$$

$$t_{el}(s,b) = i \left[1 - e^{-\Omega(s,b)} \right]$$

$$P(s,b) = 1 - \left| e^{-\Omega(s,b)} \right|^2$$

Impact parameter or b space:
elastic scattering interferes with propagation w/o collisions: Genuine quantum physics.
Complex opacity function $\Omega(s,b)$ (eikonal, from unitarity)
$0 \le P(s,b) \le 1$: *inelastic* scattering has a probabilistic interpretation

Looking for Crossing-Odd(eron) effects

$$T_{\text{el}}^{pp}(s,t) = T_{\text{el}}^{+}(s,t) - T_{\text{el}}^{-}(s,t),$$
$$T_{\text{el}}^{p\bar{p}}(s,t) = T_{\text{el}}^{+}(s,t) + T_{\text{el}}^{-}(s,t),$$
$$T_{\text{el}}^{+}(s,t) = T_{\text{el}}^{P}(s,t) + T_{\text{el}}^{f}(s,t),$$
$$T_{\text{el}}^{-}(s,t) = T_{\text{el}}^{O}(s,t) + T_{\text{el}}^{\omega}(s,t).$$

$$T_{\text{el}}^{P}(s,t) = \frac{1}{2}\left(T_{\text{el}}^{pp}(s,t) + T_{\text{el}}^{p\bar{p}}(s,t)\right)$$
$$T_{\text{el}}^{O}(s,t) = \frac{1}{2}\left(T_{\text{el}}^{p\bar{p}}(s,t) - T_{\text{el}}^{pp}(s,t)\right)$$

for $\sqrt{s} \geq 1$ TeV,

Three simple consequences:

$$T_{el}^{O}(s,t) = 0 \implies \frac{d\sigma^{pp}}{dt} = \frac{d\sigma^{p\bar{p}}}{dt} \quad \text{for } \sqrt{s} \geq 1 \text{ TeV}$$

$$\frac{d\sigma^{pp}}{dt} = \frac{d\sigma^{p\bar{p}}}{dt} \quad \text{for } \sqrt{s} \geq 1 \text{ TeV} \not\!\!\implies T_{el}^{O}(s,t) = 0.$$

$$\frac{d\sigma^{pp}}{dt} \neq \frac{d\sigma^{p\bar{p}}}{dt} \quad \text{for } \sqrt{s} \geq 1 \text{ TeV} \implies T_{el}^{O}(s,t) \neq 0$$

Odderon search: a possible strategy

Known trivial s-dependences in
$\sigma_{tot}(s)$, $\sigma_{el}(s)$, $B(s)$, $\rho(s)$

Try to scale this out
Data collapsing (scaling)

Look for scaling violations

In the TeV energy range:
Odderon is equivalent with
a crossing-odd component
Look for violations of C-symmetry

Scaling in the diffractive cone region

$$\frac{d\sigma}{dt} = A(s) \exp\left[B(s)t\right]$$

$$A(s) = B(s)\,\sigma_{\mathrm{el}}(s) = \frac{1+\rho_0^2(s)}{16\,\pi}\,\sigma_{\mathrm{tot}}^2(s),$$

$$\frac{1}{B(s)\sigma_{\mathrm{el}}(s)}\frac{d\sigma}{dt} = \exp\left[tB(s)\right]$$

$$H(x) \equiv \frac{1}{B(s)\sigma_{\mathrm{el}}(s)}\frac{d\sigma}{dt},$$

$$x = -tB(s).$$

Advantages:
1) H(x) ~ exp(-x) in the diffractive cone
2) Start from a place that you know
3) Measurable both for pp and pbarp

$$H(x) \equiv \frac{1}{B(s)\sigma_{\mathrm{el}}(s)} \frac{d\sigma}{dt},$$

$$x = -tB(s).$$

Legend:
- 62.5 GeV
- 52.8 GeV
- 44.7 GeV
- 30.7 GeV
- 23.5 GeV

y-axis: $1 / (B\,\sigma_{\mathrm{el}})\ d\sigma/dt$

x-axis: -t B
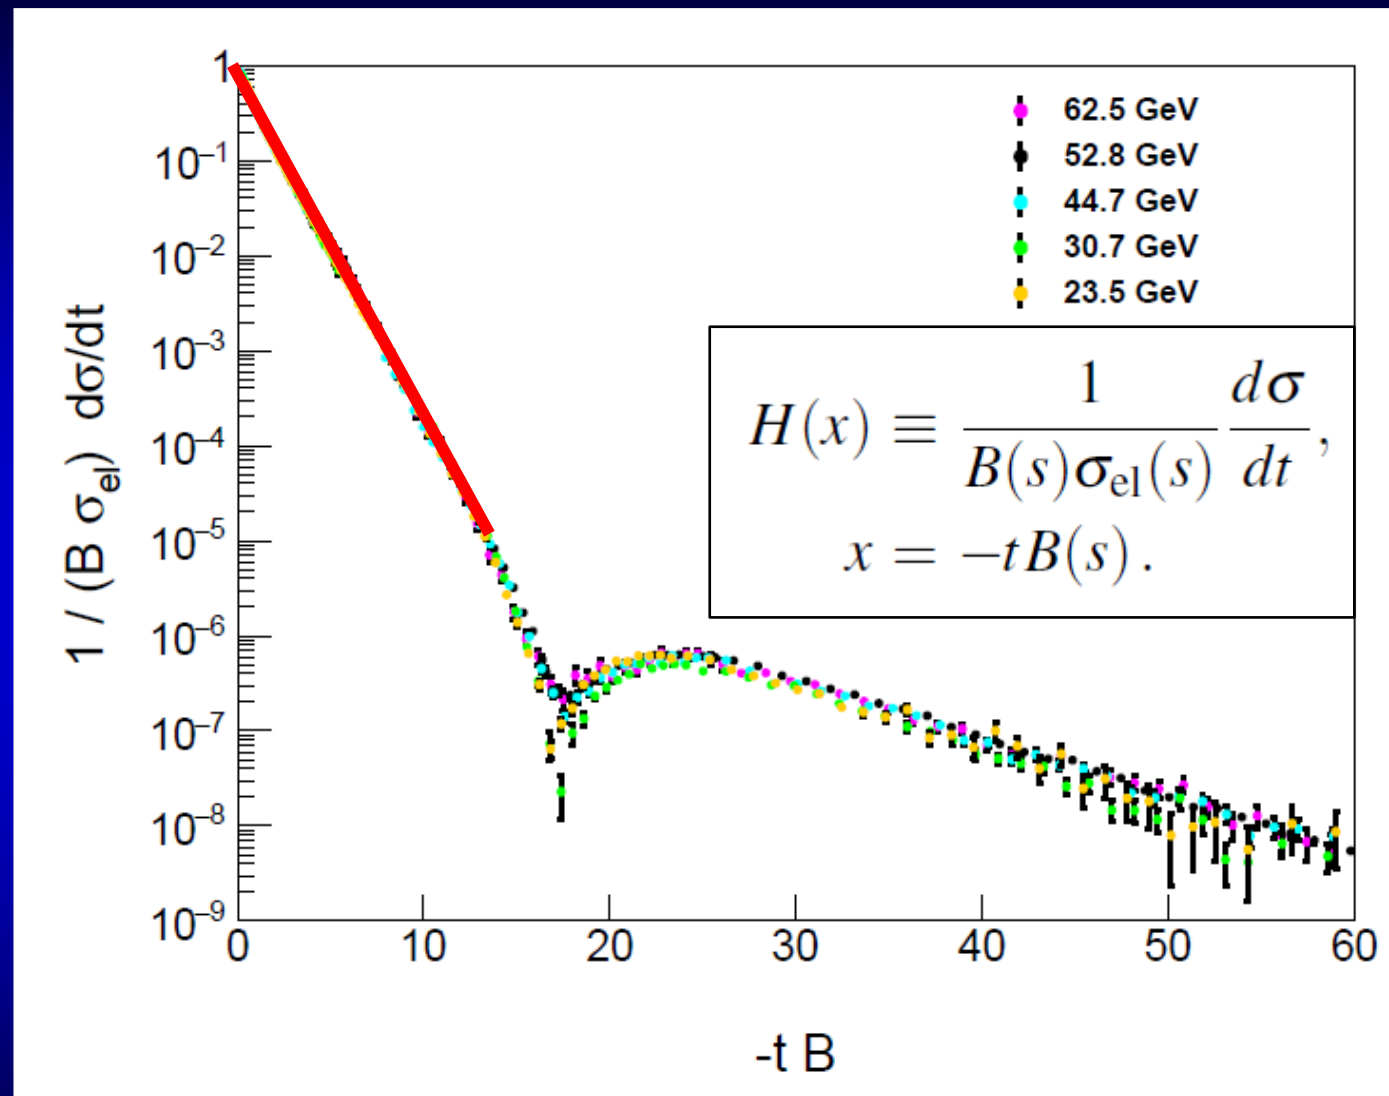

H(x) = exp(-x) in the cone
Works better than expected, even in the bump/tail region!

$$t_{el}(s, \mathbf{b}) = (i + \rho_0)\, r(s) E(\tilde{\mathbf{x}}).$$

$$
\begin{aligned}
\mathrm{Re}\, \exp\left[-\Omega(s, b)\right] &= 1 - r(s) E(\tilde{\mathbf{x}}), \\
\mathrm{Im}\, \exp\left[-\Omega(s, b)\right] &= \rho_0\, r(s) E(\tilde{\mathbf{x}}), \\
\tilde{\mathbf{x}} &= \mathbf{b}/R(s), \\
R(s) &= \sqrt{B(s)},
\end{aligned}
$$

$$\frac{d\sigma}{dt} = \frac{1}{4\pi}|T_{el}(\Delta)|^2 = \frac{1 + \rho_0^2}{4\pi} r^2(s) R^2(s) |\tilde{E}(R(s)\Delta)|^2$$

$$A = \left.\frac{d\sigma}{dt}\right|_{t=0} = \frac{1 + \rho_0^2}{4\pi} r^2(s) R^2(s) |\tilde{E}(0)|^2,$$

$$\frac{1}{A}\frac{d\sigma}{dt} = \frac{|\tilde{E}(\sqrt{x})|^2}{|\tilde{E}(x=0)|^2} = H(x),$$

Advantages:
H(x) ≠ exp(-x) arbitrary positive def. in the dip-bump region
Measurable both for pp and p-antip. Normalized as H(0) = 1.

Test of the H(x) scaling at 7 vs 2.76 TeV

$$H(x) \equiv \frac{1}{B(s)\sigma_{\mathrm{el}}(s)} \frac{d\sigma}{dt},$$

$$x = -tB(s).$$
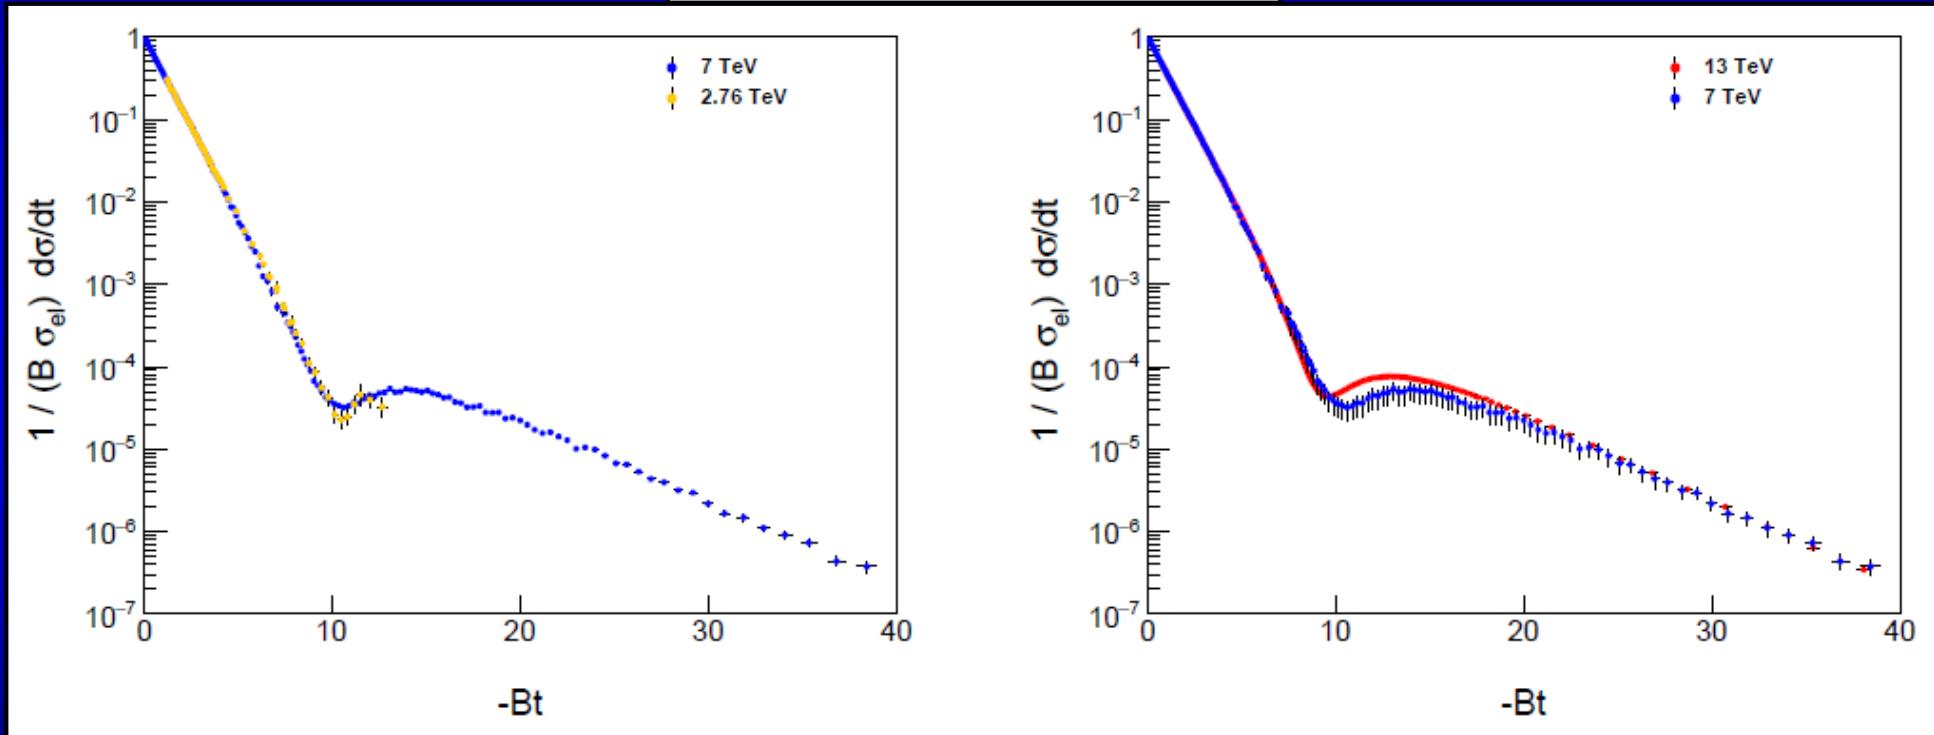

Valid between 2.76 and 7 TeV, even with stat errors only, H(x) scaling valid even in the bump/tail region! Between 8 and 13 TeV, scaling limited to the cone, but scaling **violated** beyond stat+syst errors in dip/dump/tail region!

H(x) SCALING, USING 8 TeV

Method of ratios, same as in M. Praszalowicz's talk
But for $H(x|pp,s_1)/H(x|pp,s_2)$ and to show H(x) scaling in pp

8 TeV → 2.76 TeV
χ^2/NDF = 19.7 / 63, CL = 1e+02%

2.76 TeV → 8 TeV
χ^2/NDF = 14 / 50, CL = 1e+02%

Legend:
- 2.76 TeV → 8 TeV
- 8 TeV → 2.76 TeV

Left axis: $H(x) = 1/(B\,\sigma_{el})\; d\sigma/dt$
$x = -Bt$

Right axis: $H(x,\, pp\text{-}2.76) \,/\, H(x,\, pp\text{-}8)$
x
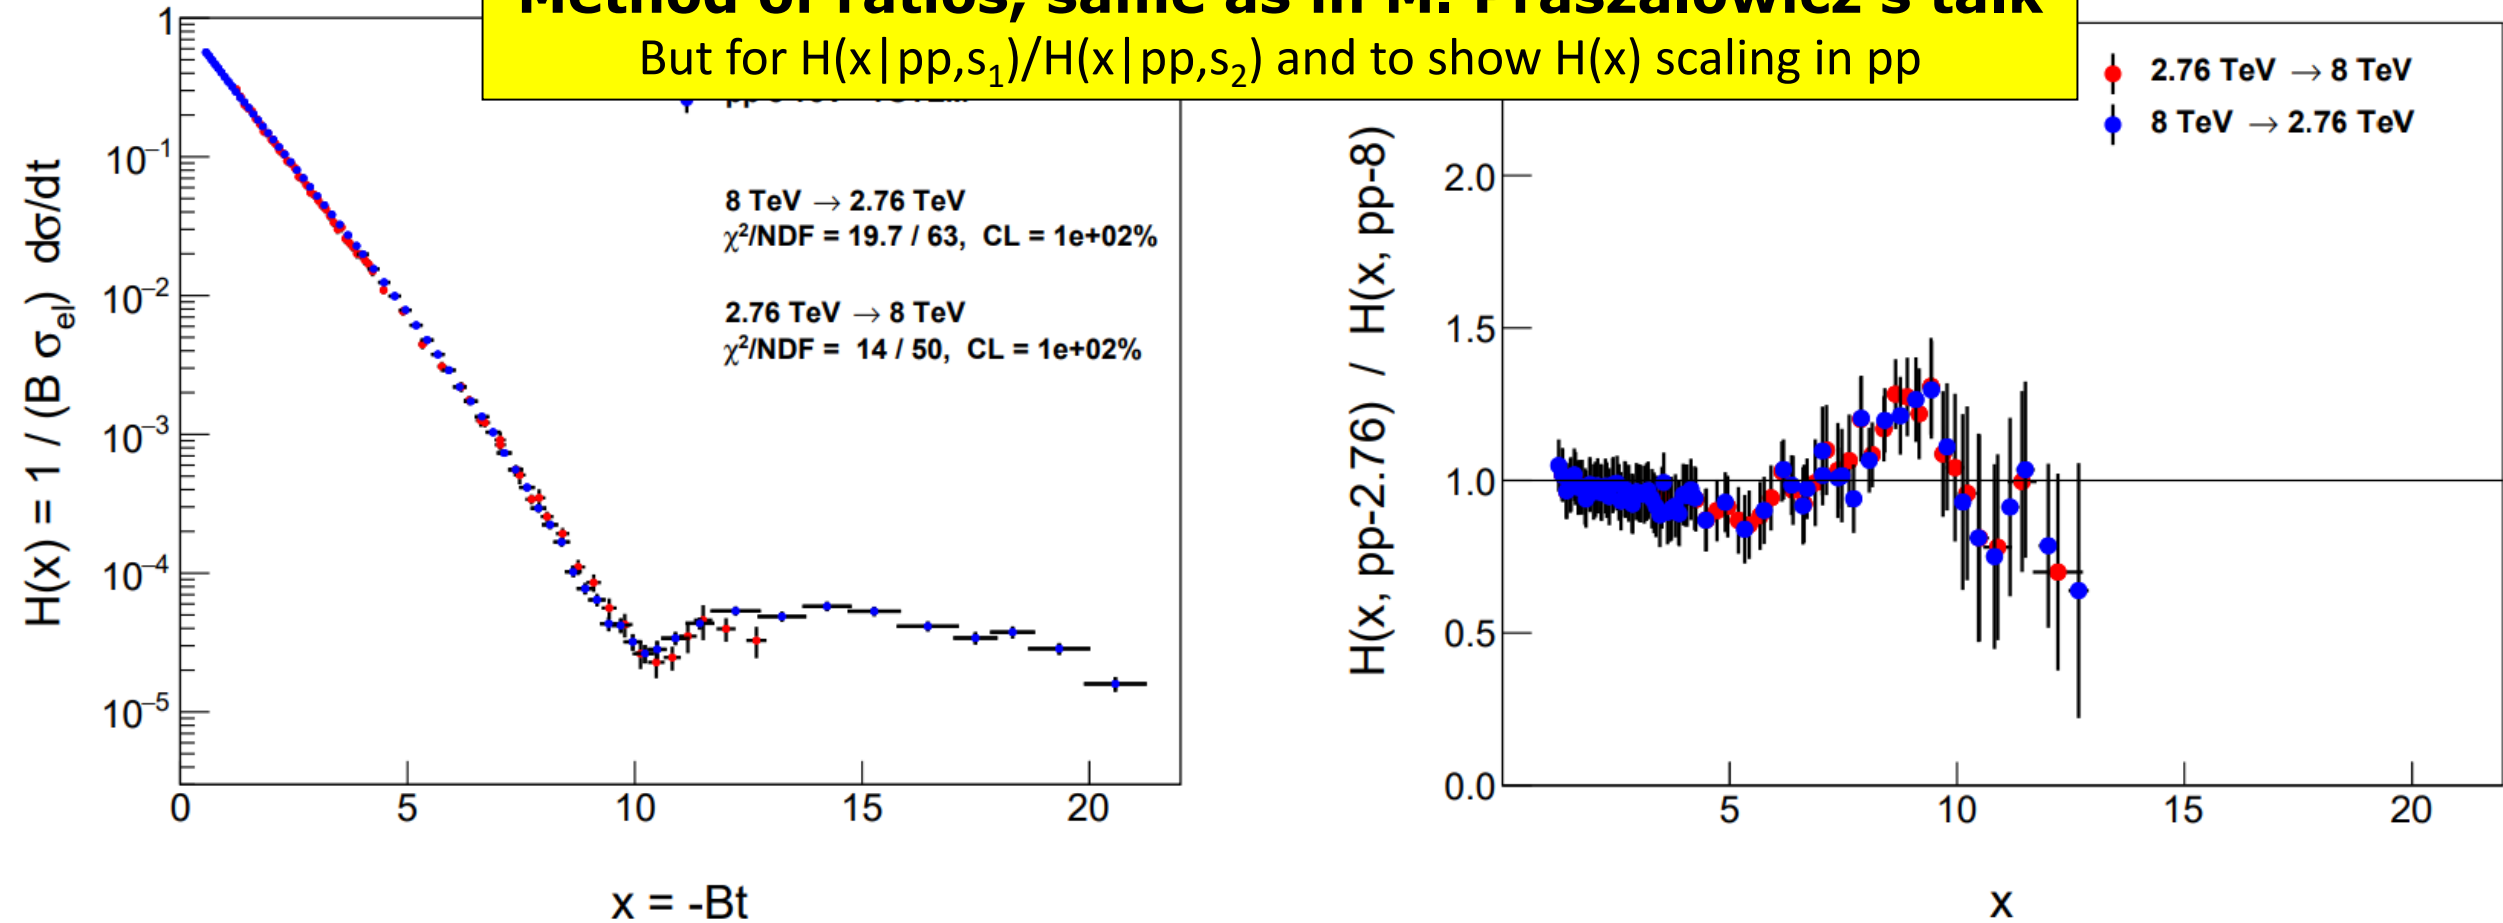

Between 2.76 and 8 TeV, H(x) scaling observed!

$$H(x) \equiv \frac{1}{B(s)\sigma_{el}(s)} \frac{d\sigma}{dt},$$
$$x = -tB(s).$$

pp 7 TeV - TOTEM
pp 8 TeV - TOTEM

8 TeV → 7 TeV
χ^2/NDF = 74.5 /145, CL = 1e+02%

7 TeV → 8 TeV
χ^2/NDF = 48.6 / 72, CL = 98%

7 TeV → 8 TeV
8 TeV → 7 TeV

$H(x) = 1 / (B \, \sigma_{el}) \; d\sigma/dt$

x = -Bt

$H(x, pp\text{-}7) \, / \, H(x, pp\text{-}8)$

x
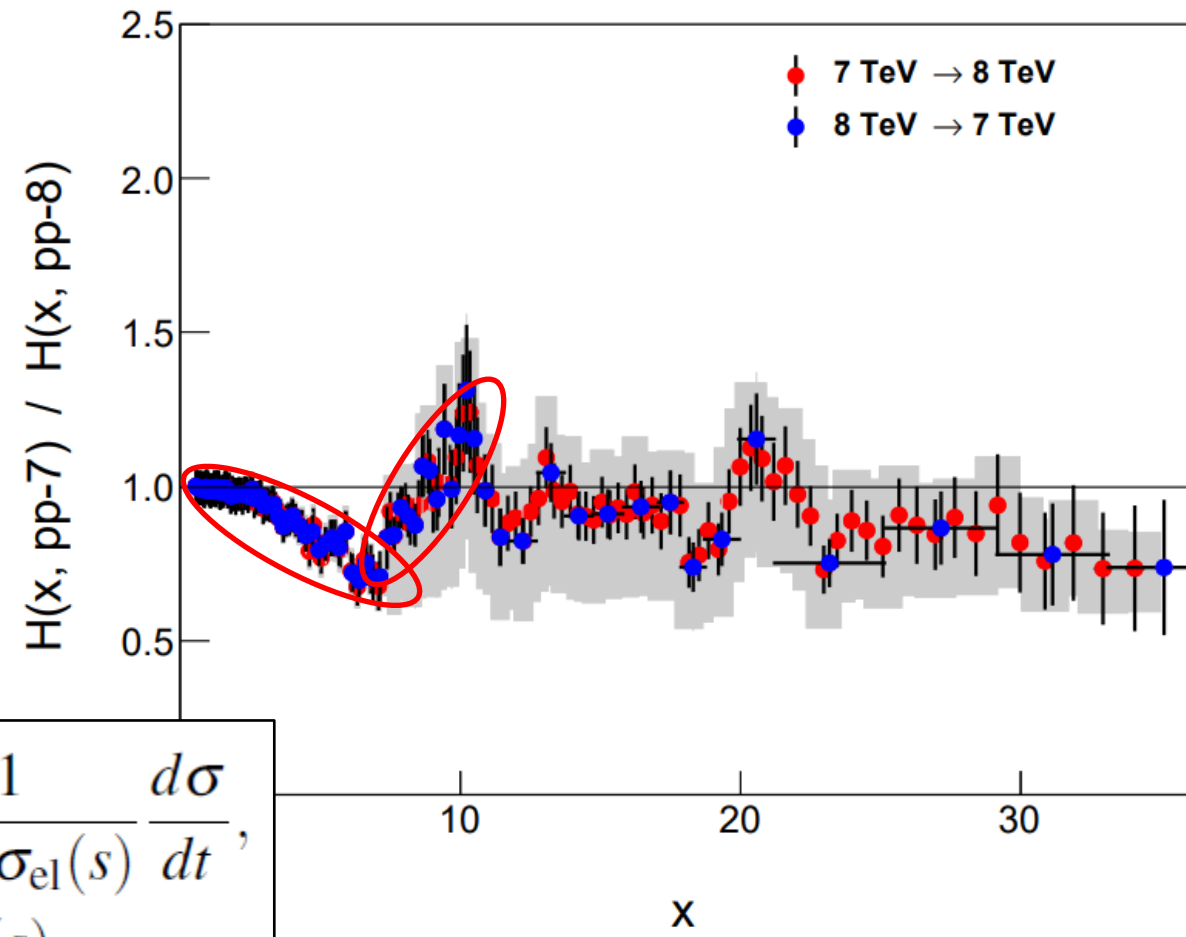

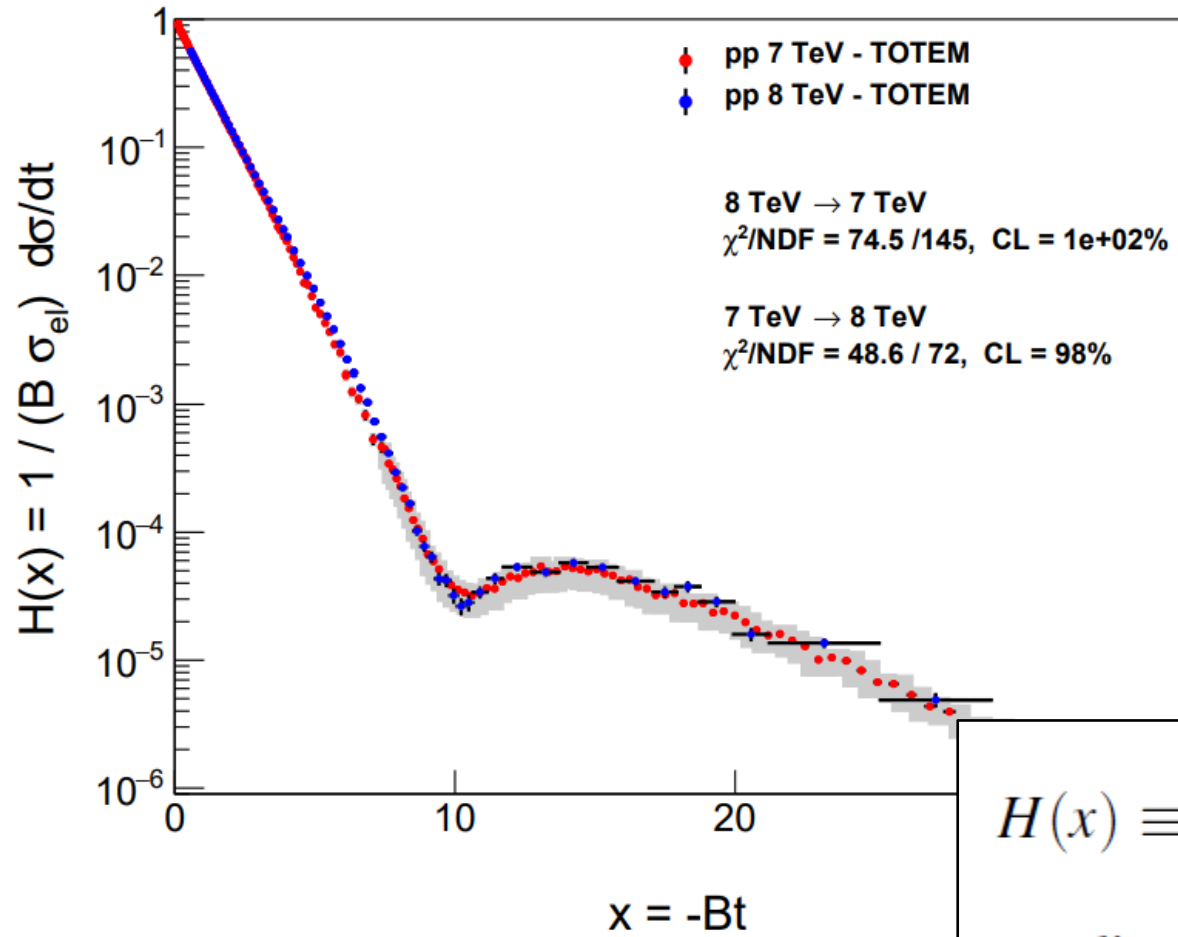

$$H(x) \equiv \frac{1}{B(s)\sigma_{el}(s)} \frac{d\sigma}{dt},$$
$$x = -tB(s).$$

Between 7 and 8 TeV, H(x) scaling observed, but …
Hungarian-Swedish team, e-Print: 2405.06733 [hep-ph],
MDPI Universe **2024**, *10*(6), 264

Method of ratios, same as in M. Praszalowicz's talk
But for H(x|pbarp)/H(x|pp) and to show the Odderon signal

8 TeV → 1.96 TeV ($\epsilon_{b,8TeV}$ = -1.37):
χ^2/NDF = 46.4 / 17, CL = 0.015%

1.96 TeV → 8 TeV ($\epsilon_{b,8TeV}$ = -0.56):
χ^2/NDF = 92.8 / 35, CL = 3.9e-05%

$$H(x) \equiv \frac{1}{B(s)\sigma_{el}(s)} \frac{d\sigma}{dt},$$
$$x = -tB(s).$$
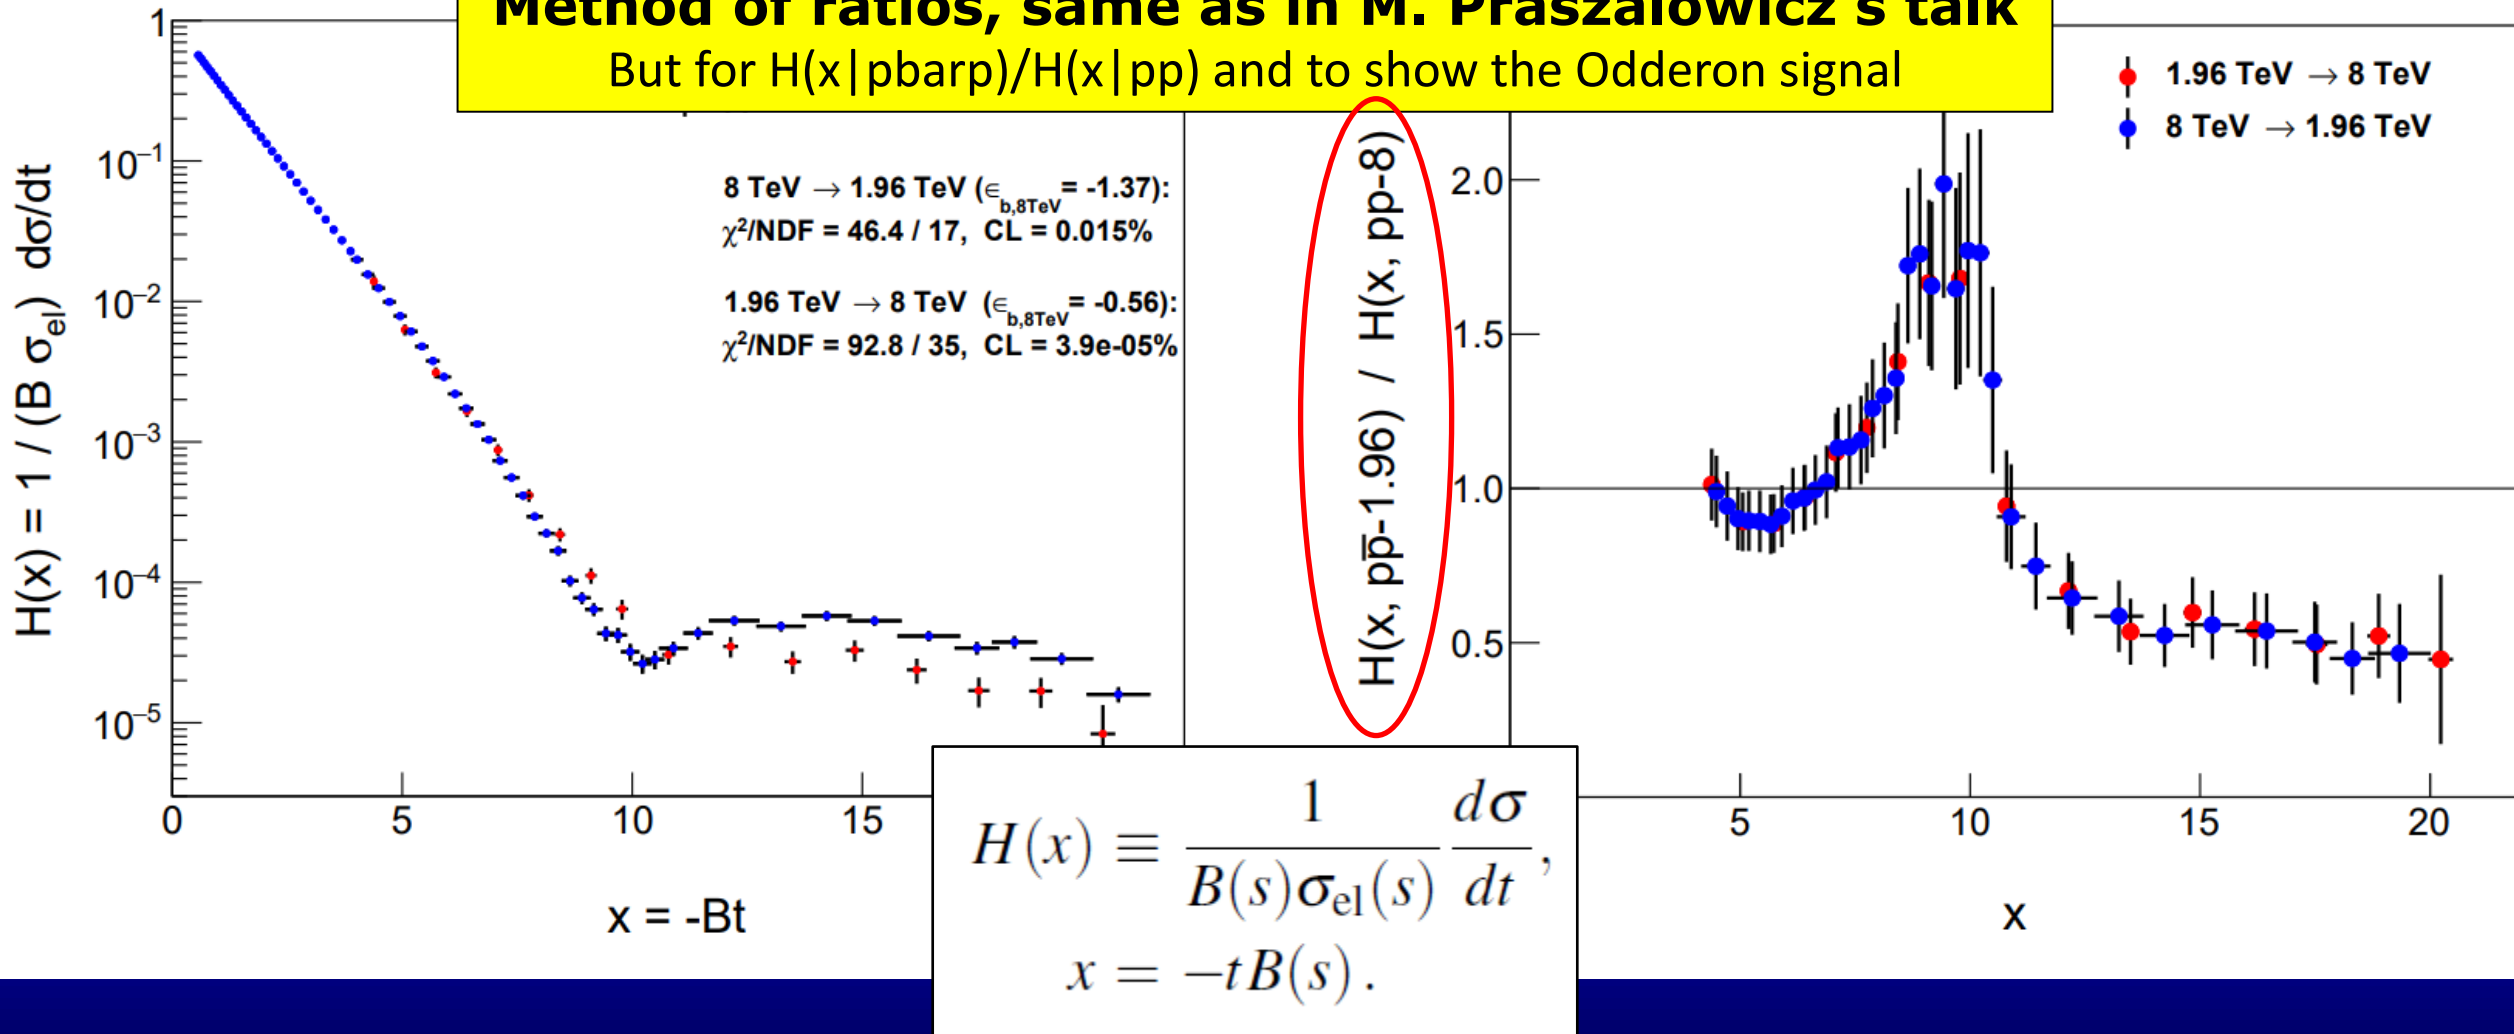

Between 1.96 and 8 TeV, H(x|s,pp) and H(x|s,pbarp) are clearly different, with 3 < 3.79 < 5 σ

Odderon significances from H(x) scaling

$\sqrt{s}$ (TeV)	χ^2	NDF	CL	significance (σ)
1.96 vs. 2.76	3.85	11	9.74×10^{-1}	0.03
1.96 vs. 7	80.1	17	3.681×10^{-10}	6.26
1.96 vs. 8	46.4	17	1.502×10^{-4}	3.79

Simple Levy fits at small –t
(For details, see the poster of I. Szanyi)

$$\frac{d\sigma}{dt}(s,t) \simeq A(s)\exp(tB(s))$$

$$\sigma_{el}(s) = \int_0^\infty d|t| \frac{d\sigma(s)}{dt}$$

$$A(s) = \frac{1}{16\pi}(1 + \rho_0^2(s))\sigma_{tot}^2(s)$$

$$\sigma_{el}(s) = \frac{1}{16\pi}(1 + \rho_0^2(s))\frac{\sigma_{tot}^2(s)}{B_0(s)}$$

If Odderon exists: signals possible both at t = 0 and at –t > 0.
Where the significance of the signal is coming from?

$$T_{\rm el}^{O}(s,t) = \frac{1}{2}\left(T_{\rm el}^{p\bar{p}}(s,t) - T_{\rm el}^{pp}(s,t)\right)$$

valid for $\sqrt{s} \geq 1\,\text{TeV},$

Some simple consequences at small –t, Gaussian sources:

If any of

$$\frac{d\sigma}{dt}(s,t) \simeq A(s)\exp(tB(s))$$

$$A^{pp}(s) \neq A^{p\bar{p}}(s),$$
$$B^{pp}(s) \neq B^{p\bar{p}}(s).$$

is statistically significant

$$\text{for } \sqrt{s} \geq 1\,\text{TeV} \implies T_{\rm el}^{O}(s,0) \neq 0$$

$$\rho_0^{pp}(s) \neq \rho_0^{p\bar{p}}(s),$$
$$\sigma_{el}^{pp}(s) \neq \sigma_{el}^{p\bar{p}}(s),$$
$$\sigma_{tot}^{pp}(s) \neq \sigma_{tot}^{p\bar{p}}(s).$$

33

$$T_{\text{el}}^{O}(s,t) = \frac{1}{2}\left(T_{\text{el}}^{p\bar{p}}(s,t) - T_{\text{el}}^{pp}(s,t)\right)$$

valid for $\sqrt{s} \geq 1\,\text{TeV},$

Some simple consequences at small –t, Levy sources:

If any of

$$\frac{d\sigma}{dt}(s,t) \simeq a(s)\exp\left[-(tb(s))^{\alpha_L/2}\right]$$

$$a^{pp}(s) \neq a^{p\bar{p}}(s),$$
$$b^{pp}(s) \neq b^{p\bar{p}}(s),$$
$$\alpha_L^{pp} \neq \alpha_L^{p\bar{p}},$$

is statistically significant

$$\text{for } \sqrt{s} \geq 1\,\text{TeV} \implies T_{el}^{O}(s,0) \neq 0$$

$$\rho_0^{pp}(s) \neq \rho_0^{p\bar{p}}(s),$$
$$\sigma_{el}^{pp}(s) \neq \sigma_{el}^{p\bar{p}}(s),$$
$$\sigma_{tot}^{pp}(s) \neq \sigma_{tot}^{p\bar{p}}(s).$$

Levy generalized Bialas-Bzdak Model

Simple results at small -t:

$$a(s) = \frac{81}{16}\pi \left(2R_q^{\alpha_L(s)}(s)\right)^{4/\alpha_L} (1 + 4\alpha_R^2(s))$$

$$b(s) = \frac{1}{36}\left(\frac{4}{3}\right)^{2/\alpha_L(s)} \left((2 + 2^{\alpha_L(s)})R_{qd}^{\alpha_L(s)}(s) + 3^{\alpha_L(s)}\left(2R_d^{\alpha_L(s)}(s) + R_q^{\alpha_L(s)}(s)\right)\right)^{2/\alpha_L(s)}$$

$$\rho_0(s) = 2\alpha_R(s)$$

$$\sigma_{tot}(s) = 9\pi \left(2R_q^{\alpha_L(s)}(s)\right)^{2/\alpha_L(s)}$$

$$\sigma_{el}(s) = \frac{a(s)}{b(s)}\Gamma\left(\frac{2 + \alpha_L(s)}{\alpha_L(s)}\right)$$

From data fits: R_q, R_d, R_{qd}, α_L is same in pp and pbarb But!

$$\rho_0^{pp}(s) \neq \rho_0^{p\bar{p}}(s),$$
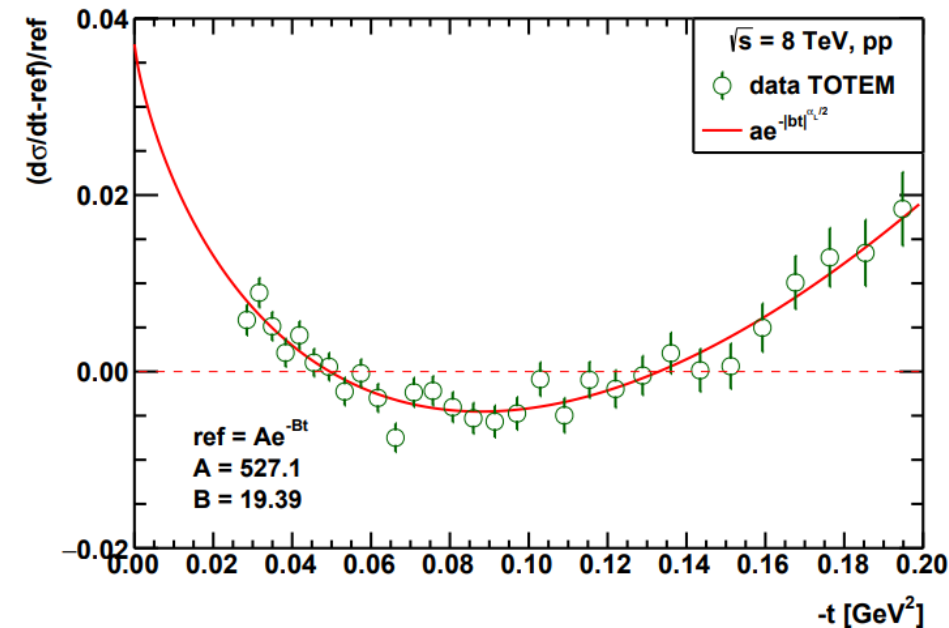

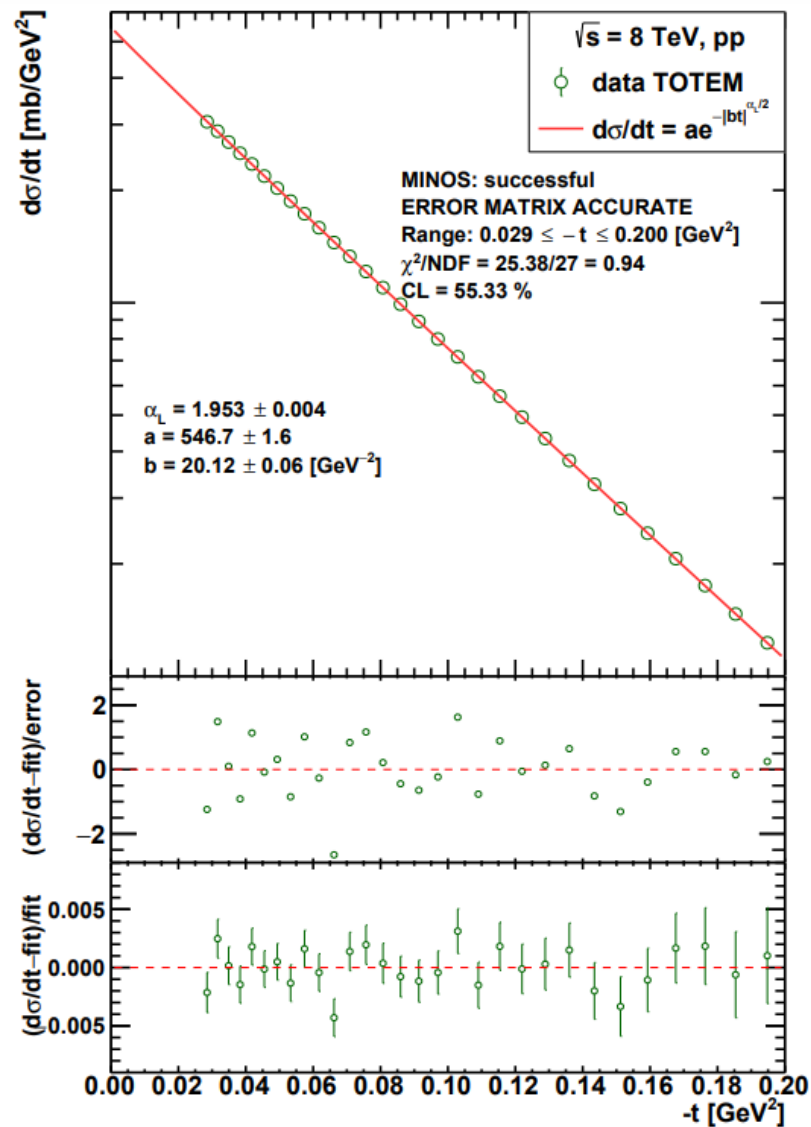

$$\frac{d\sigma}{dt}(s,t) \simeq a(s) \exp\left[-(tb(s))^{\alpha_L/2}\right]$$

From Glauber's theory, p=(q,d)
Good quality fits at 8 TeV and also
at every low −t dataset for pp, pbarp

$$\frac{d\sigma}{dt}(s,t) \simeq a(s) \exp\left[-(tb(s))^{\alpha_L/2}\right]$$
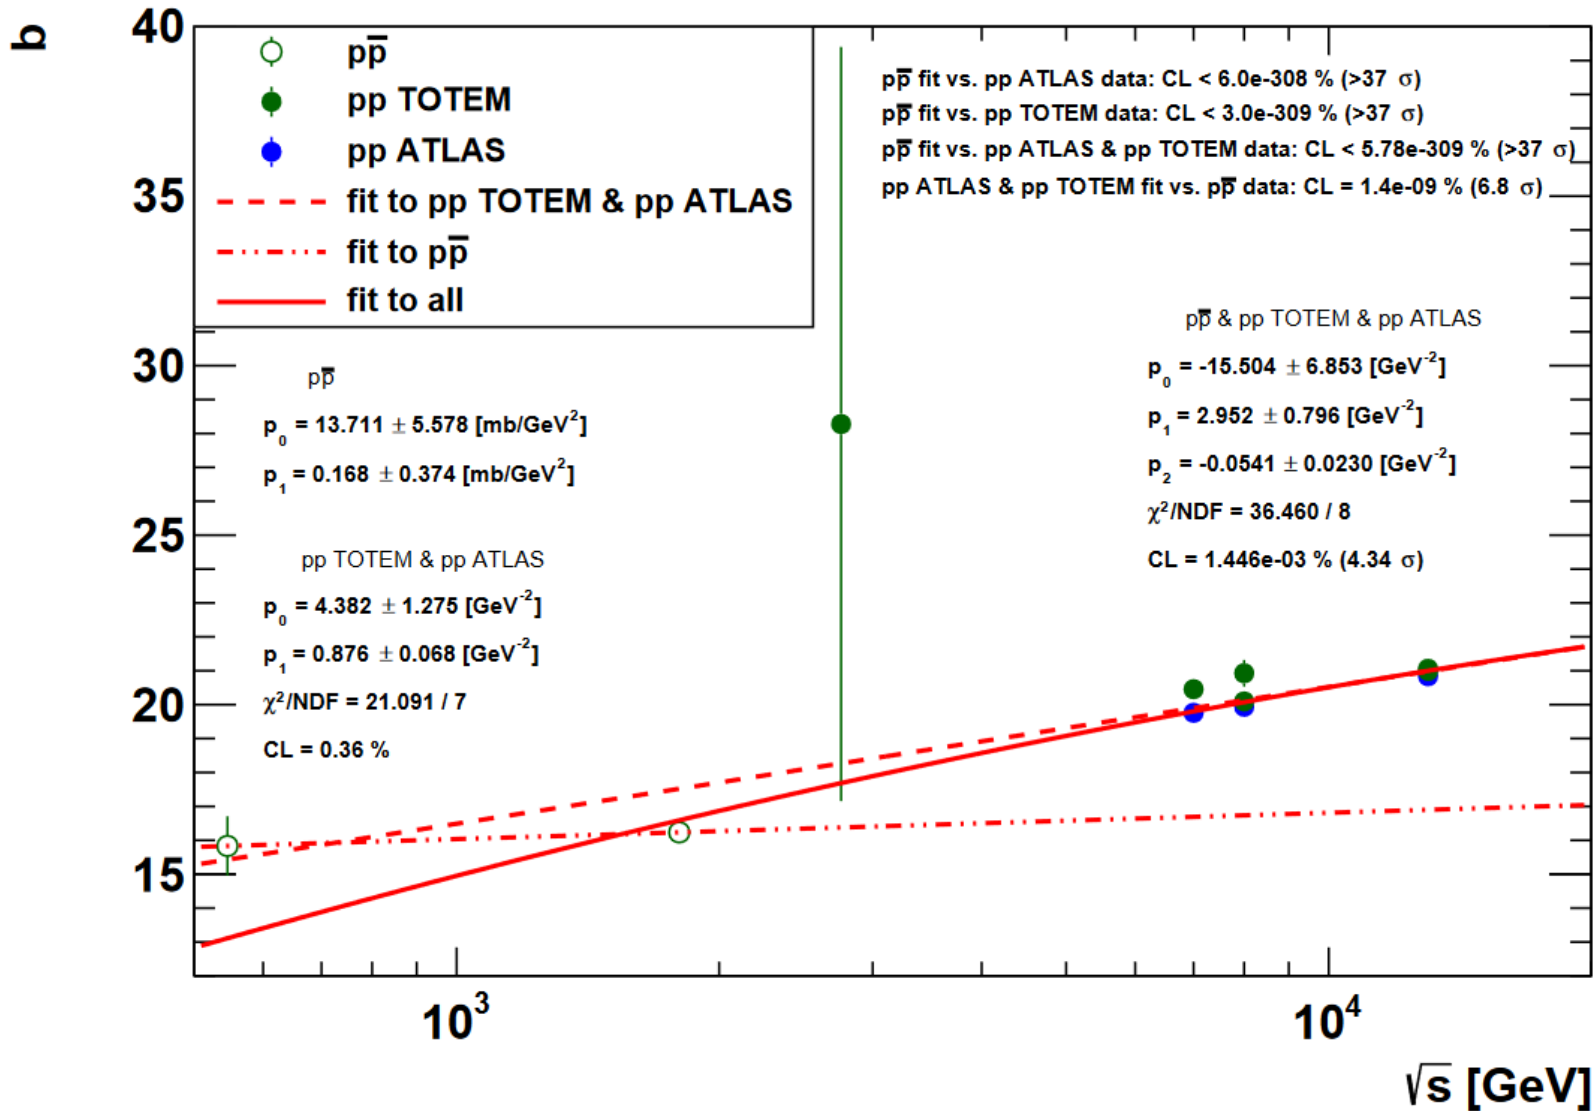

$$\frac{d\sigma}{dt}(s,t) \simeq a(s) \exp\left[-(tb(s))^{\alpha_L/2}\right]$$
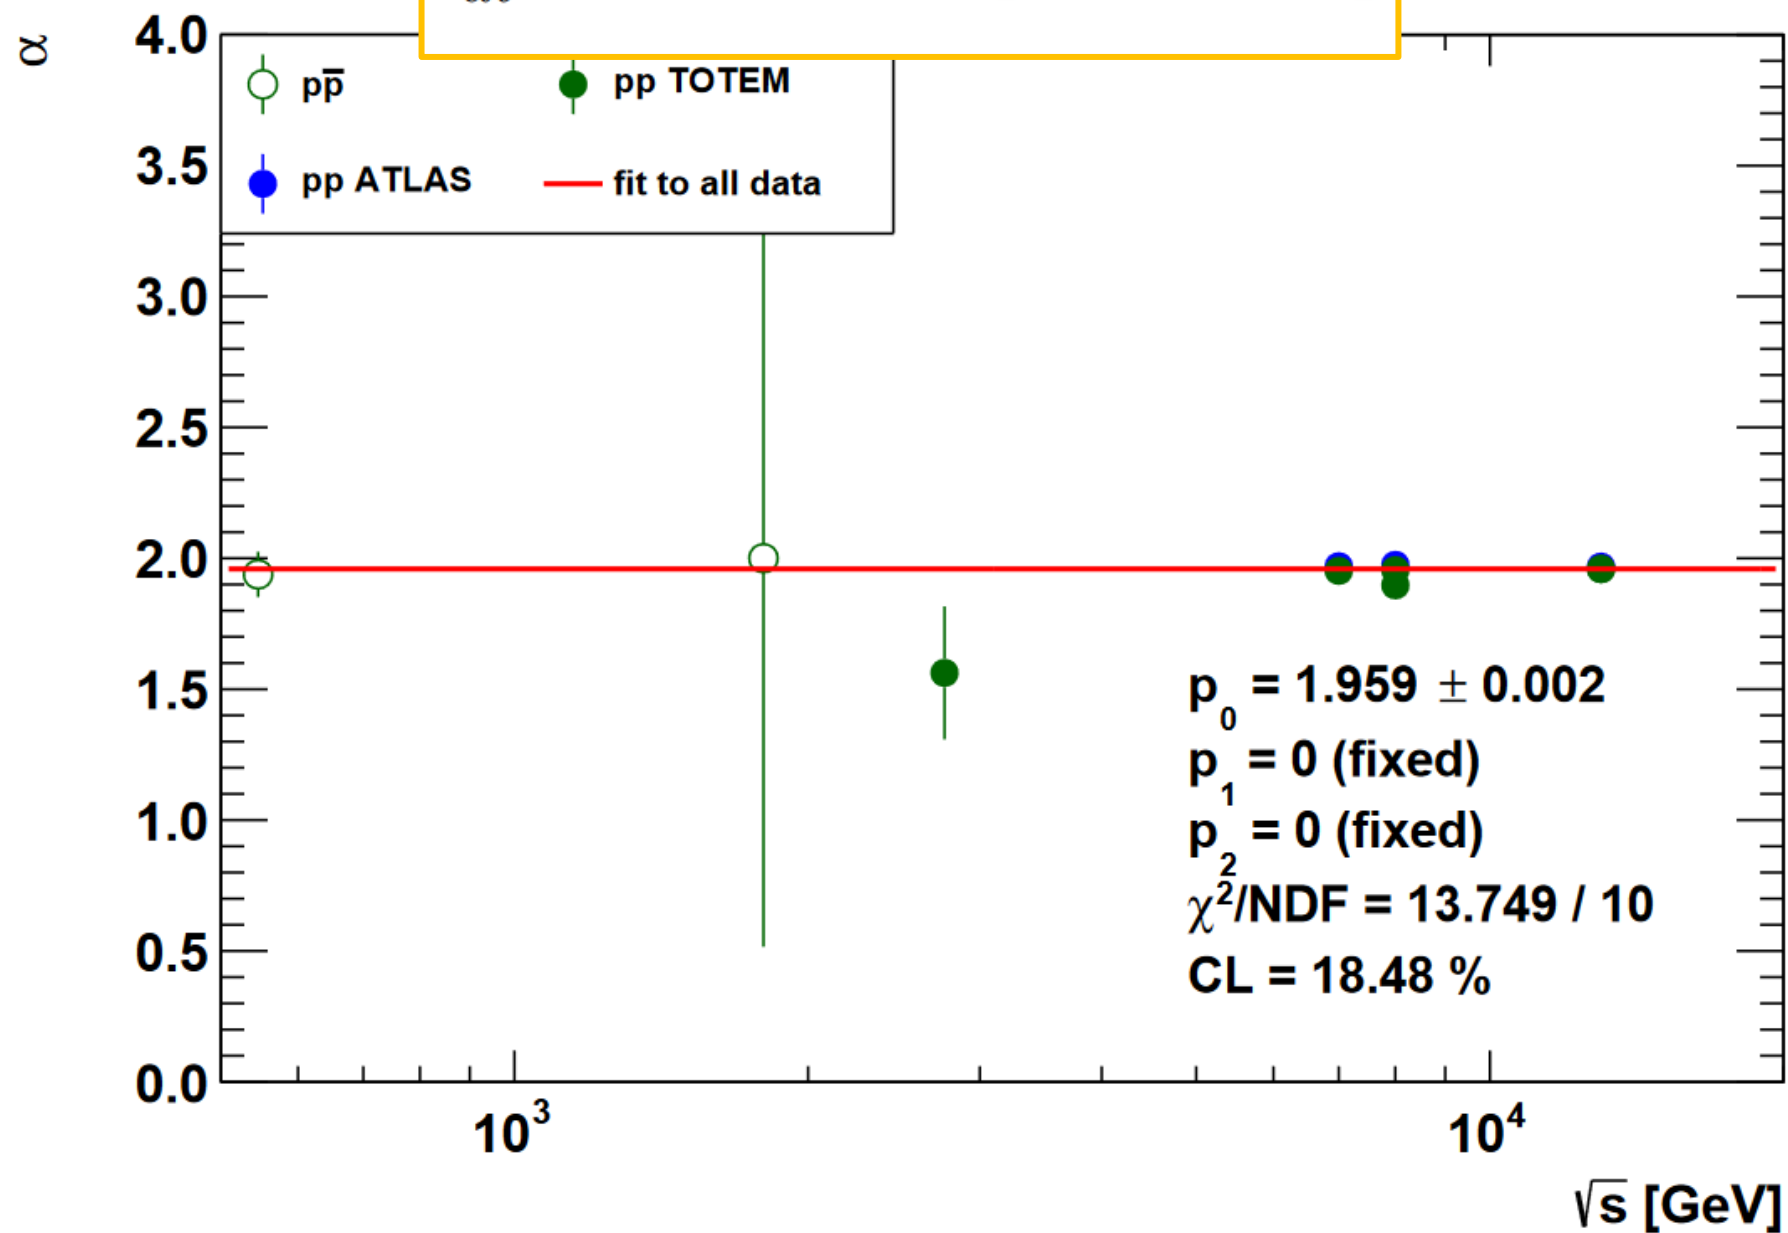

$$\frac{d\sigma}{dt}(s,t) \simeq a(s) \exp\left[-(tb(s))^{\alpha_L/2}\right]$$

$$b^{pp}(s) = b^{p\bar{p}}(s),$$
$$\sigma_{tot}^{pp}(s) = \sigma_{tot}^{p\bar{p}}(s).$$

$$a^{pp}(s) \neq a^{p\bar{p}}(s),$$
$$\rho_0^{pp}(s) \neq \rho_0^{p\bar{p}}(s),$$
$$\sigma_{el}^{pp}(s) \neq \sigma_{el}^{p\bar{p}}(s),$$

Dramatic consequences:
Strong form of Pomeranchuk theorem!

Signals of odderon exchange in

- **optical point,**
- **ρ and**
- **elastic cross-section!**

Tests are needed...

Summary and conclusions

New 8 TeV TOTEM data strenghten
Odderon signal using H(x) scaling method

New 8 TeV TOTEM data strenghten
Odderon signal using ReBB model

ReBB fit range can be extended to low –t at
8 TeV, if ATLAS data are used
instead of TOTEM low –t data

Levy generalization of ReBB model in progress
to fit TOTEM+TOTEM data at 8 TeV

Levy ReBB suggest a strong form of the
Pomeranchuk theorem

THANK YOU !

QUESTIONS?

H(x) rebin: linear interpolations in x

Need for a comparison of different data sets
measured at different values of x:
Linear interpolation to the same x = -t B
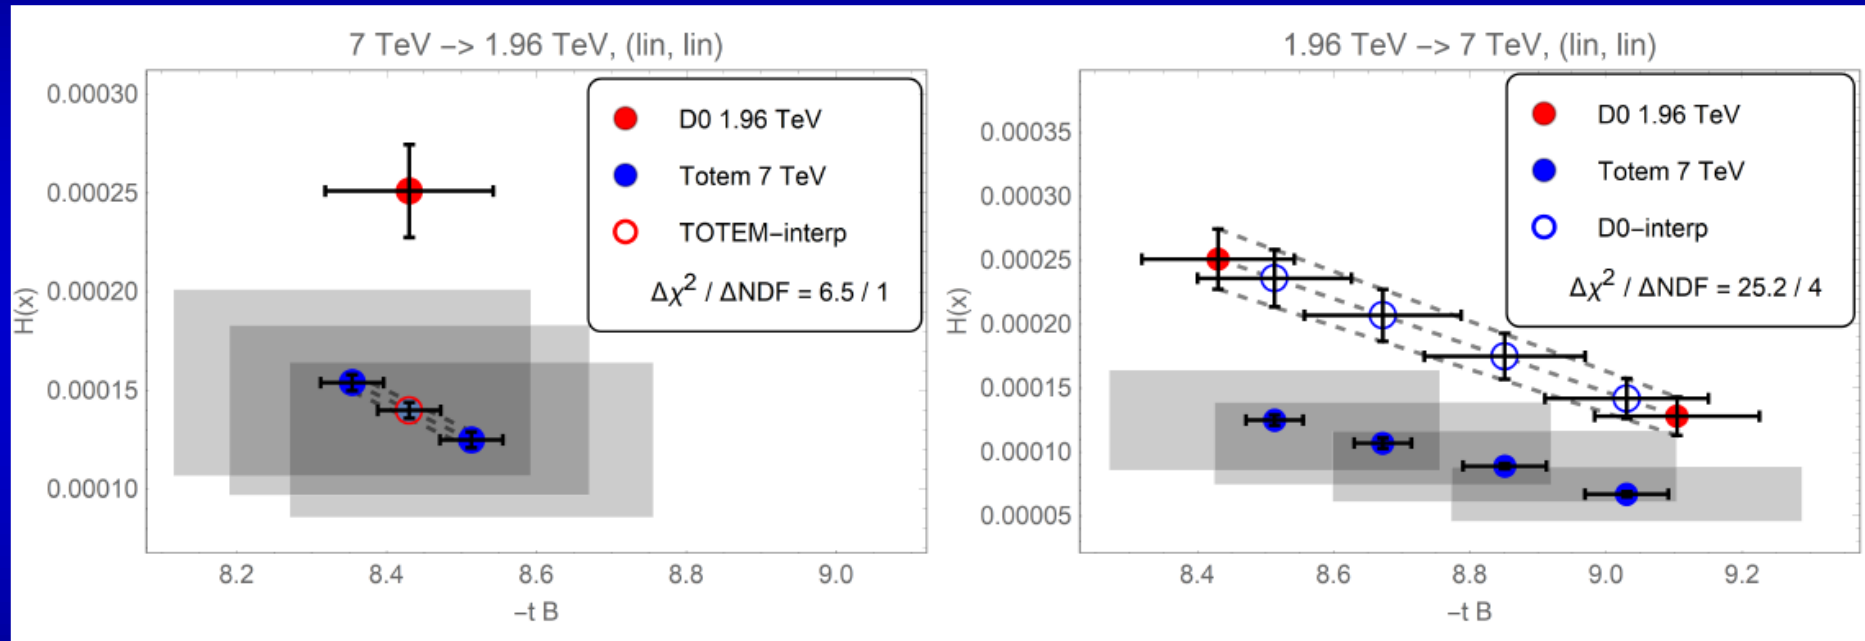

Errors: both vertical AND horizontal, type A, B, C
type A: point-to-point fluctuating error
type B: point-to-point 100 % correlated error
type C: point independent overall correlated error

Model independent results since ISMD'19

Right panel legend:
- $p\bar{p}$ 1.96 TeV - D0
- pp 7 TeV - TOTEM

$\sigma_{el}(1.96\ \text{TeV}) = 20.2 \pm 1.7$ mb

lin - exp interpolation
7 TeV → 1.96 TeV ($\epsilon_{b,7TeV}$ = -0.56)
χ^2/NDF = 80.1 / 17, CL = 3.7e-08%

1.96 TeV → 7 TeV ($\epsilon_{b,7TeV}$ = -0.59)
χ^2/NDF = 287 / 65, CL = 1.3e-27%

Left panel labels:
min:
$\epsilon_{b,7TeV}$ = -0.56
χ^2/ndf = 80.1/17
σ = 6.265
7 TeV → 1.96 TeV
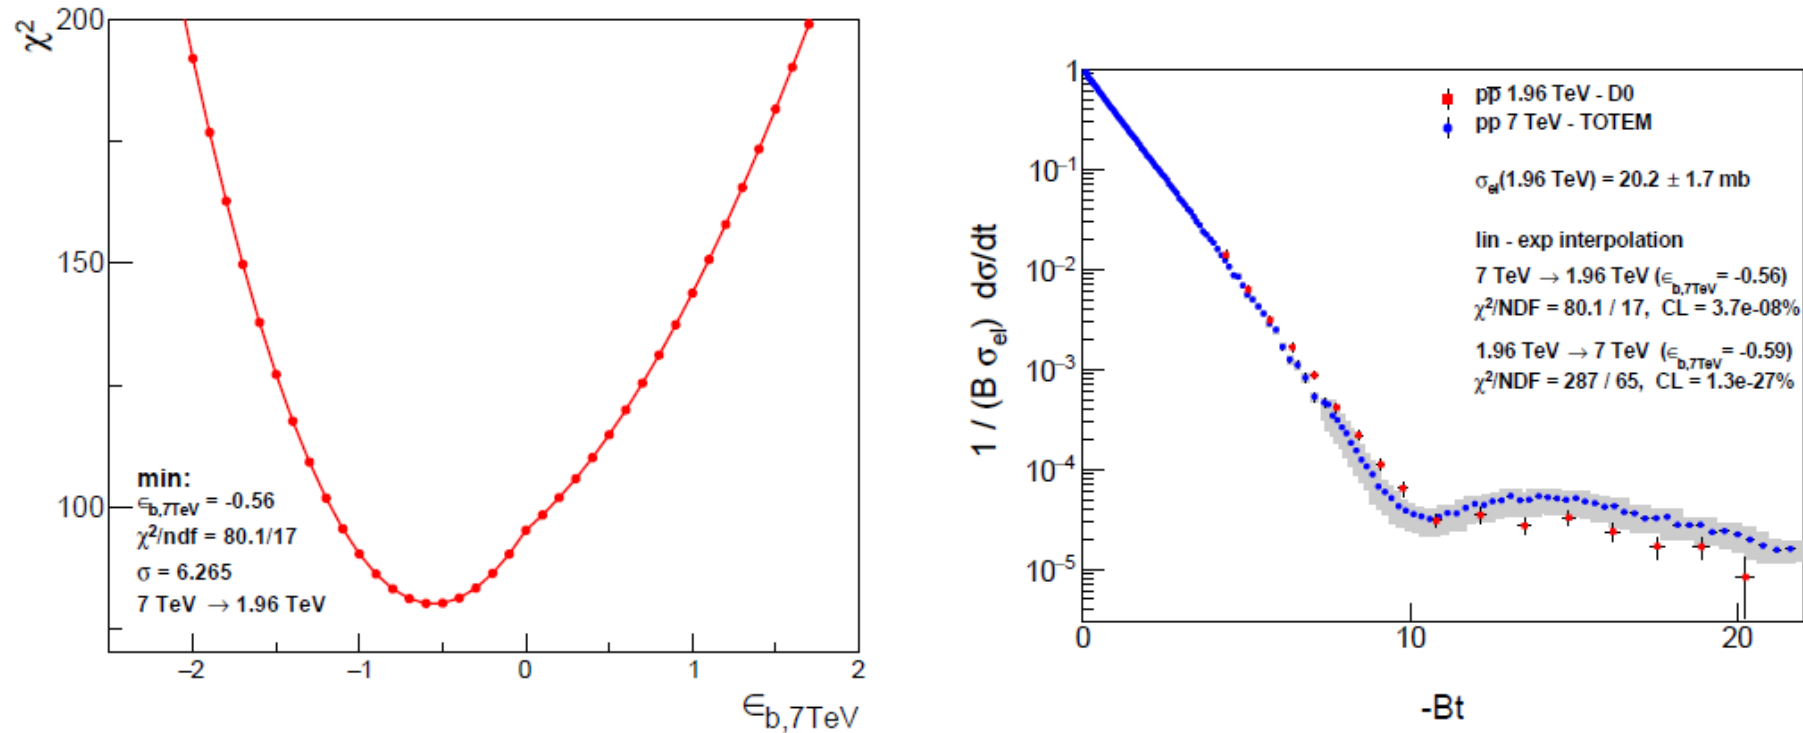

Fig. 13 Left panel indicates that as a function of $\varepsilon_{b,7\ \text{TeV}}$, the $\chi^2 \equiv \bar{\chi}^2_{21}$ distribution has a unique minimum and nearly quadratic minimum. The minimum value is $\chi^2/\text{NDF} = 80.1/17$, corresponding to a statistically significant difference between the pp and $p\bar{p}$ $H(x)$ scaling functions. at the level of 6.26σ. The right panel shows the comparison of the $H(x)$ data using the values of $\varepsilon_{b,7\ \text{TeV}}$ corresponding to such a minimum, both for the case of the $7 \to 1.96$ TeV and for the case of $1.96 \to 7$ TeV projections.

Model independent Odderon significance 6.26 σ
11 pages, 2 figures , synthesis of data analysis and theory results
New result presented in this talk: domain of validity model independently

H(x|pp)
s-independent:
2.76 − 7(8) TeV

H(x|pp, 7 TeV)
≠
H(x|pantip, 1.96 TeV)

Odderon,
IF scaling holds
in pp down to
1.96 TeV

**6.26 σ
Odderon effect**

Energy range: tested both model independently and with modelling.
Modelling is useful, but model independent tests more important!

# Asymmetry parameter for C-violation

$$A(x|p\bar{p},s_1|pp,s_2) = \frac{H(x|p\bar{p},s_1) - H(x|pp,s_2)}{H(x|p\bar{p},s_1) + H(x|pp,s_2)},$$

$$A(x|pp,s_1|pp,s_2) = \frac{H(x|pp,s_1) - H(x|pp,s_2)}{H(x|pp,s_1) + H(x|pp,s_2)}.$$

A(x|pbarp,s_1|pp,s_2)
does NOT vanish
for a C-symmetry violation AND

A(x|pp,s_1|pp,s_2)
vanishes if
H(x) scaling valid

Energy range: HAS to be tested carefully

$$A = \frac{H(x|pp,2.76) - H(x|pp,7)}{H(x|pp,2.76) + H(x|pp,7)}$$

- 7 TeV → 2.76 TeV
- 2.76 TeV → 7 TeV
- ReBB

$$A = \frac{H(x|p\bar{p},1.96) - H(x|pp,7)}{H(x|p\bar{p},1.96) + H(x|pp,7)}$$

- 7 TeV → 1.96 TeV
- 1.96 TeV → 7 TeV
- ReBB

x = -Bt

x = -Bt
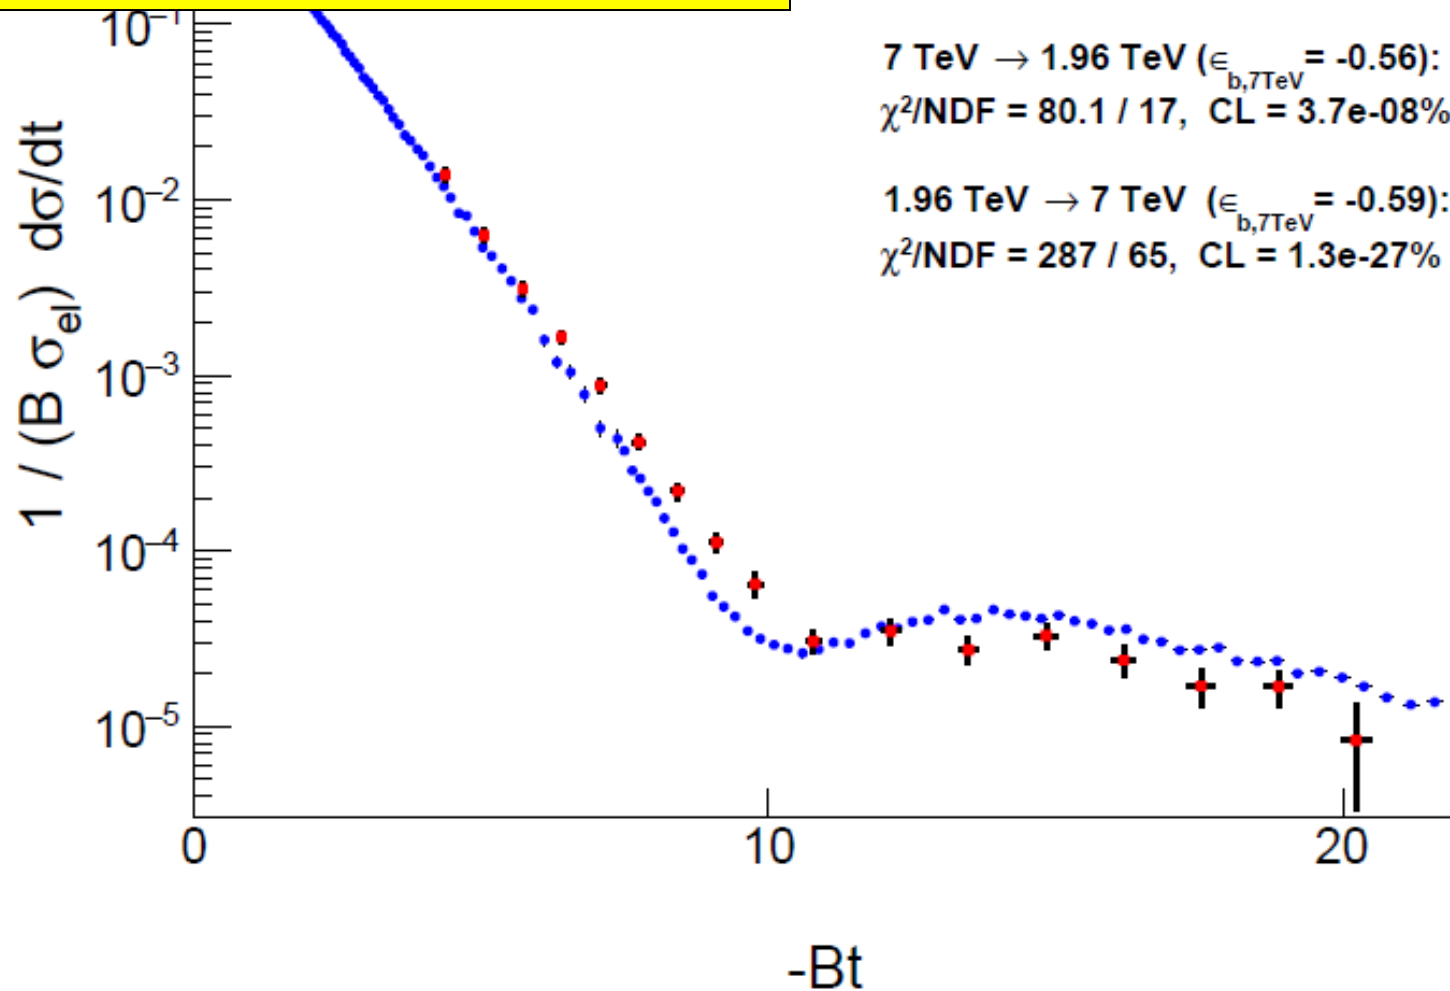

$A(x|pp,s_1|pp,s_2) \sim 0$
vanishes if
H(x) scaling valid

$A(x|pbarp,s_1|pp,s_2) \neq 0$
does NOT vanish
if Odderon term is present

Scaling violations: under theoretical control:
Model calculations by solid line, see e-Print: 2005.14319 [hep-ph]
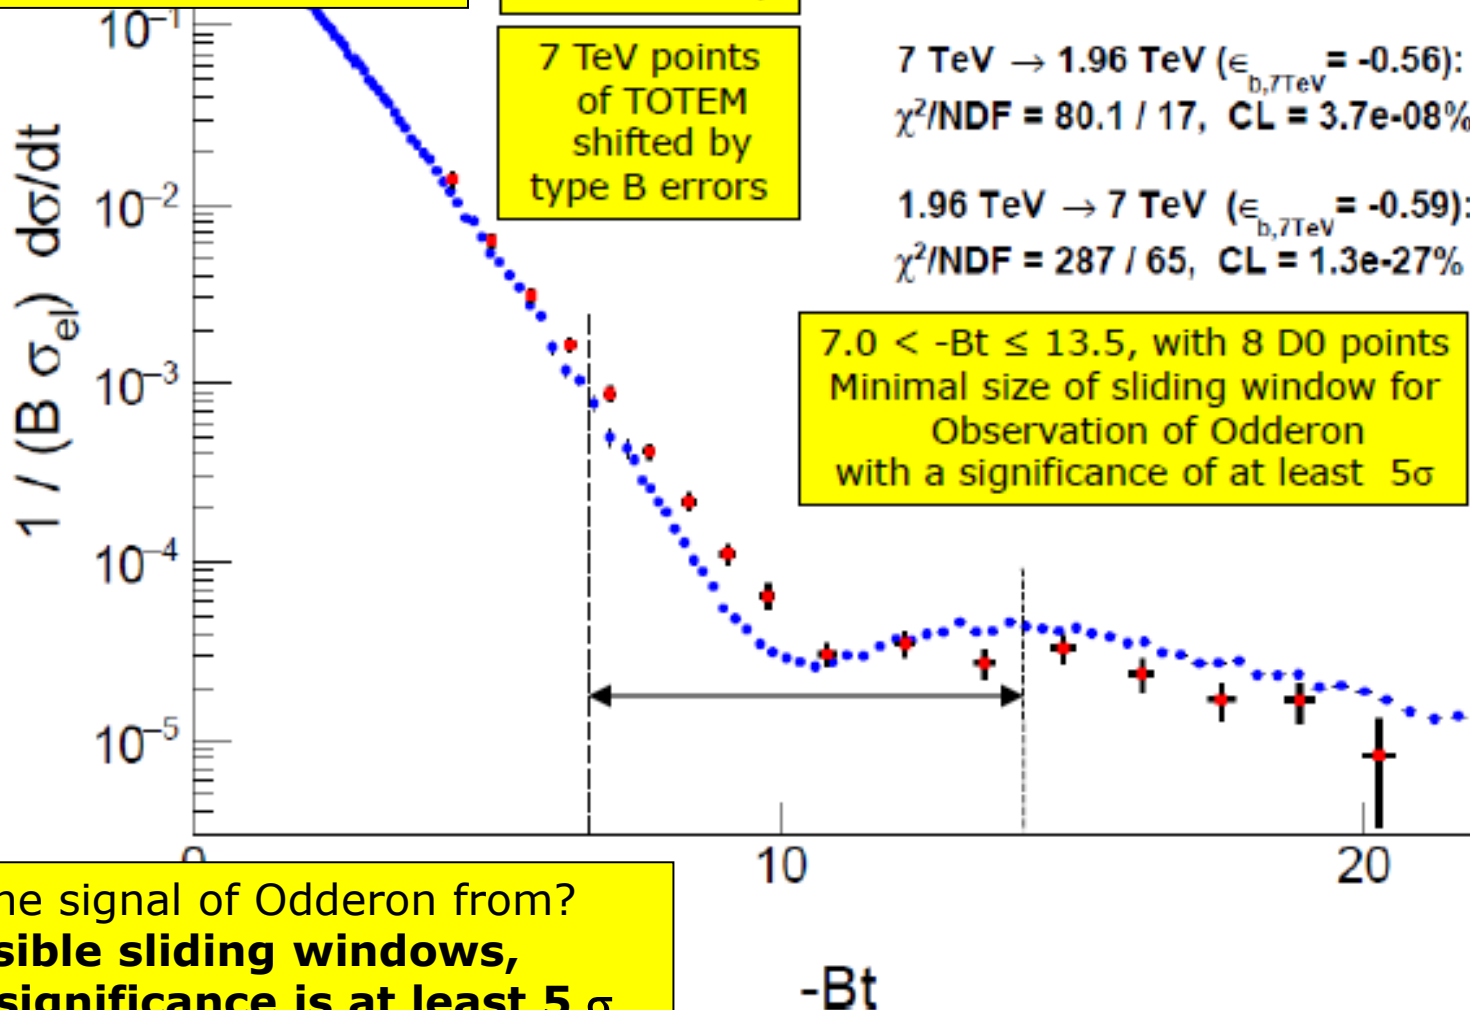

7 TeV data shifted
by $\varepsilon_{B7,TeV}$ to minimize χ^2
Type A errors are shown only
Both swing and dip regions important!

p$\bar{\text{p}}$ 1.96 TeV - D0
pp 7 TeV (shifted by $\epsilon_{b,7TeV}$)

7 TeV → 1.96 TeV ($\epsilon_{b,7TeV}$ = -0.56):
χ^2/NDF = 80.1 / 17, CL = 3.7e-08%

1.96 TeV → 7 TeV ($\epsilon_{b,7TeV}$ = -0.59):
χ^2/NDF = 287 / 65, CL = 1.3e-27%

$1 / (B \, \sigma_{el}) \; d\sigma/dt$

-Bt

7 TeV → 1.96 TeV ($\epsilon_{b,7TeV}$ = -0.56):
χ^2/NDF = 80.1 / 17, CL = 3.7e-08%

1.96 TeV → 7 TeV ($\epsilon_{b,7TeV}$= -0.59):
χ^2/NDF = 287 / 65, CL = 1.3e-27%

7.0 < -Bt ≤ 13.5, with 8 D0 points
Minimal size of sliding window for
Observation of Odderon
with a significance of at least 5σ

y-axis: $1 / (B\, \sigma_{el})\ d\sigma/dt$

x-axis: -Bt

Where is the signal of Odderon from?
All possible sliding windows, where the significance is at least 5 σ

Is H(x,s) = H(x) at 1.96 TeV?

MODEL INDEPENDENTLY: YES!
In the background of the Odderon signal,
defined as $x \leq 7.0$ in union with $x > 13.5$
H(x|pp,7 TeV) ~ H(x|pbarp, 1.96 TeV)
Agreement: a significance of 2.39 σ

x_{max}	ε_{B21} of min$[\chi^2(\text{background})]$	$\Delta\chi^2(\text{background})$	NDF(background)	σ (background)
Results for the background: $x \leq 7.0$ in union with $x > 13.5$ for $\varepsilon_{B21}(7\ \text{TeV}) = -1.1$ that minimizes signal in the background				
20.2	-1.10	20.20	9	2.39

New MODEL INDEPENDENT result

Is H(x,s) = H(x) at 1.96 TeV?
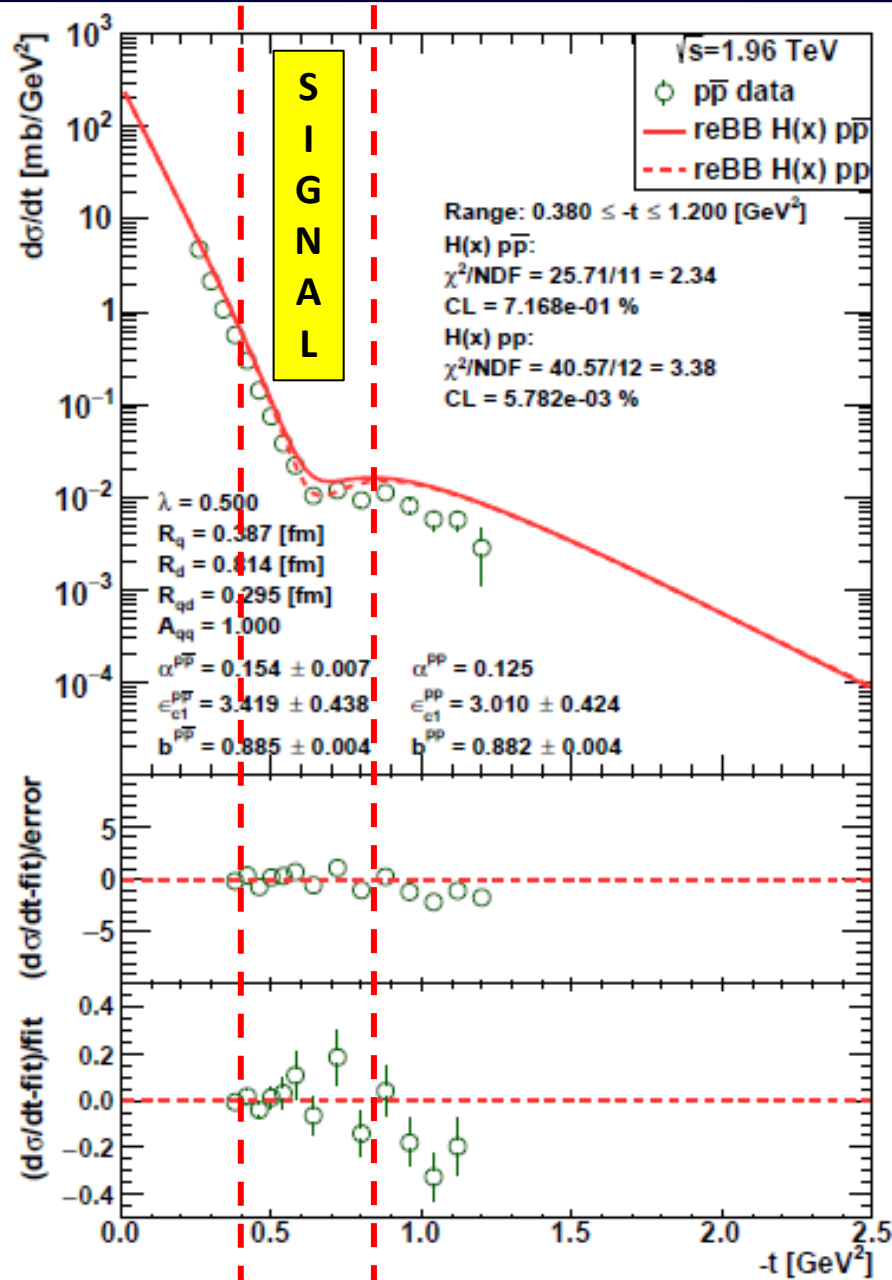

MODEL DEPENDENTLY: Yes
1.96 TeV
Highest energy where p+antip data are available

H(x) scaling limit:
in the Bialas-Bzdak model

Fits pbarp data up to largest -t
(red line, dashed line: pp)

Pull plots:
(data-fit)/error
(data-fit)/fit

t_{max}(1.96 TeV, pp) > 1.2 GeV^2

→ x_{max}(**1.96 TeV, pp) > 20**

Safely above the 5 σ threshold

Role of the H(x) scaling violations
Do they decrease the signal or not?

√s (TeV)	χ^2	NDF (ReBB)	σ (ReBB)
1.96	24.28	13	2.19
2.76	100.35	20	7.12
1.96 and 2.76	124.63	33	7.08

H(x) scaling: allows to project pp data ONLY
Scaling violations decrease significance at 1.96 TeV
BUT
Also allow to evaluate pbarp data at 2.76 TeV

Trade-off effect!

**Odderon significance increases
from 6.26 to 7.08 σ .**

Predictions for pp and pbarp dσ/dt @ 510 GeV
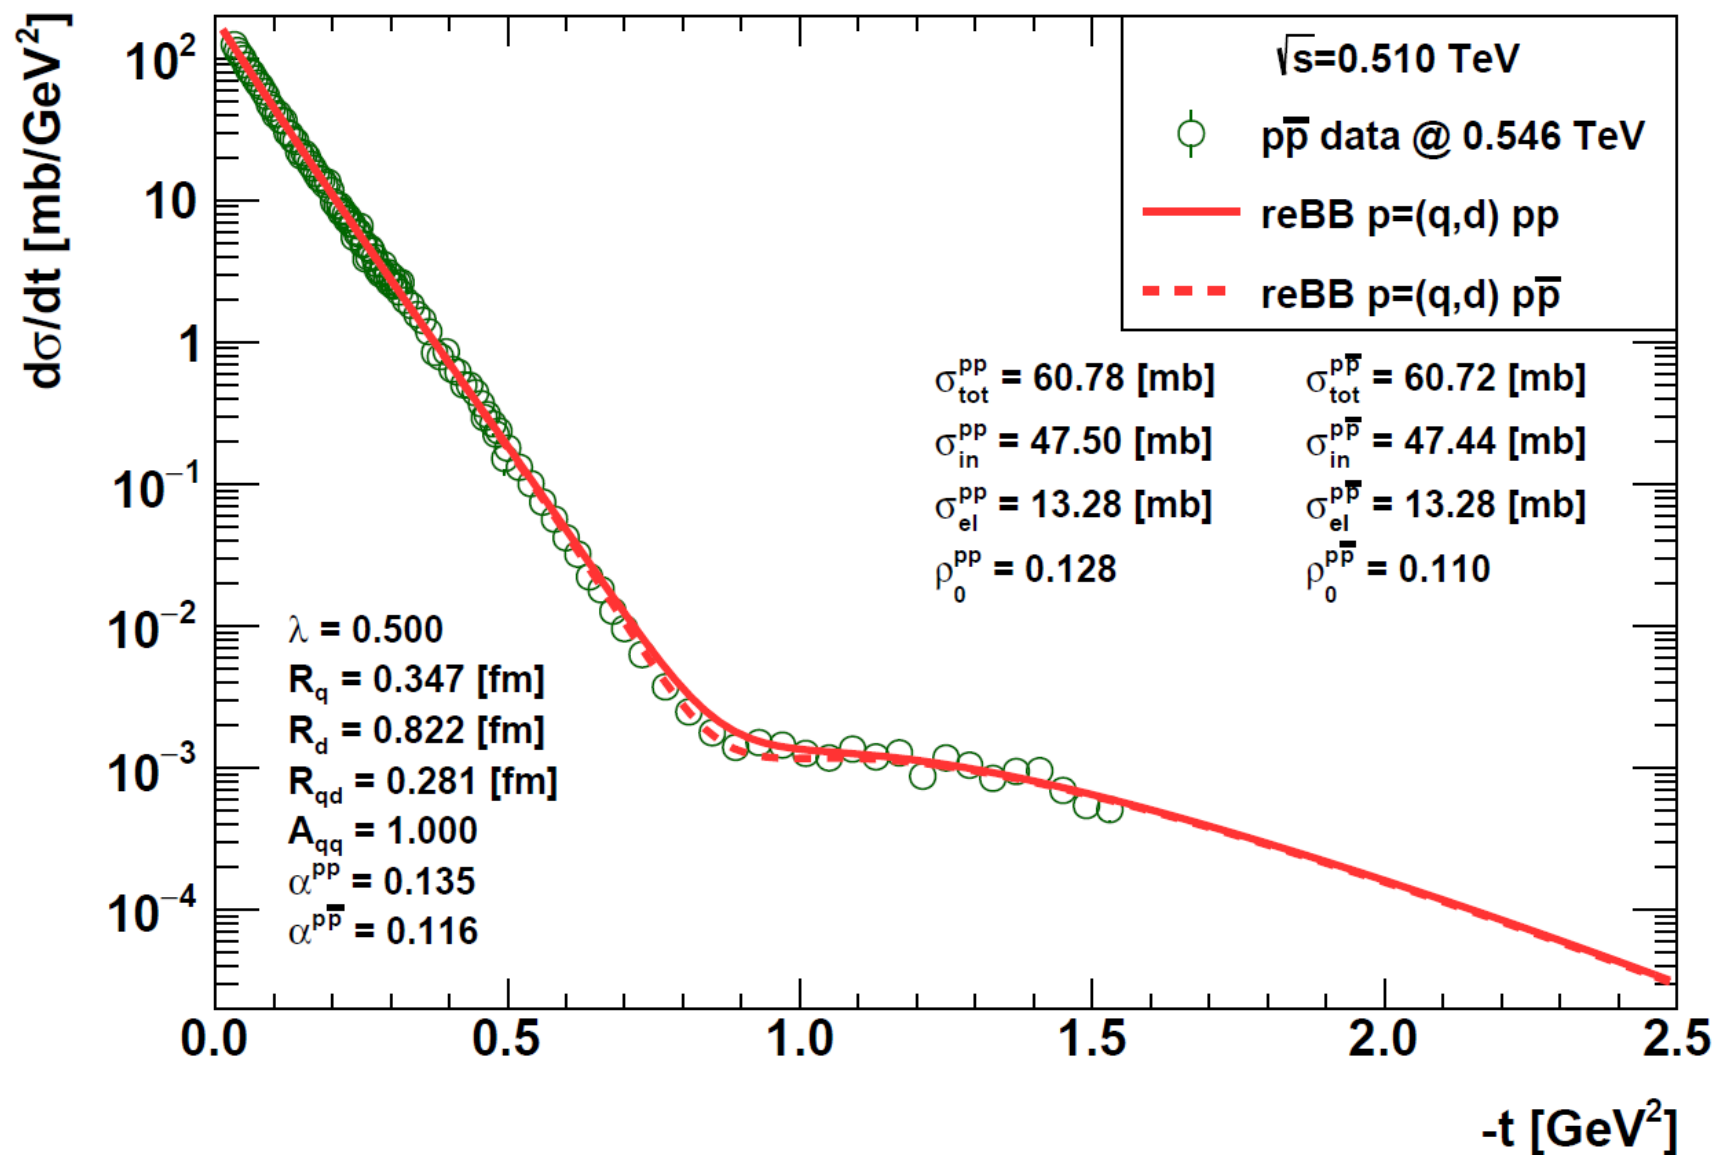

Model dependent Odderon signal @510 GeV: pp above pbarp !
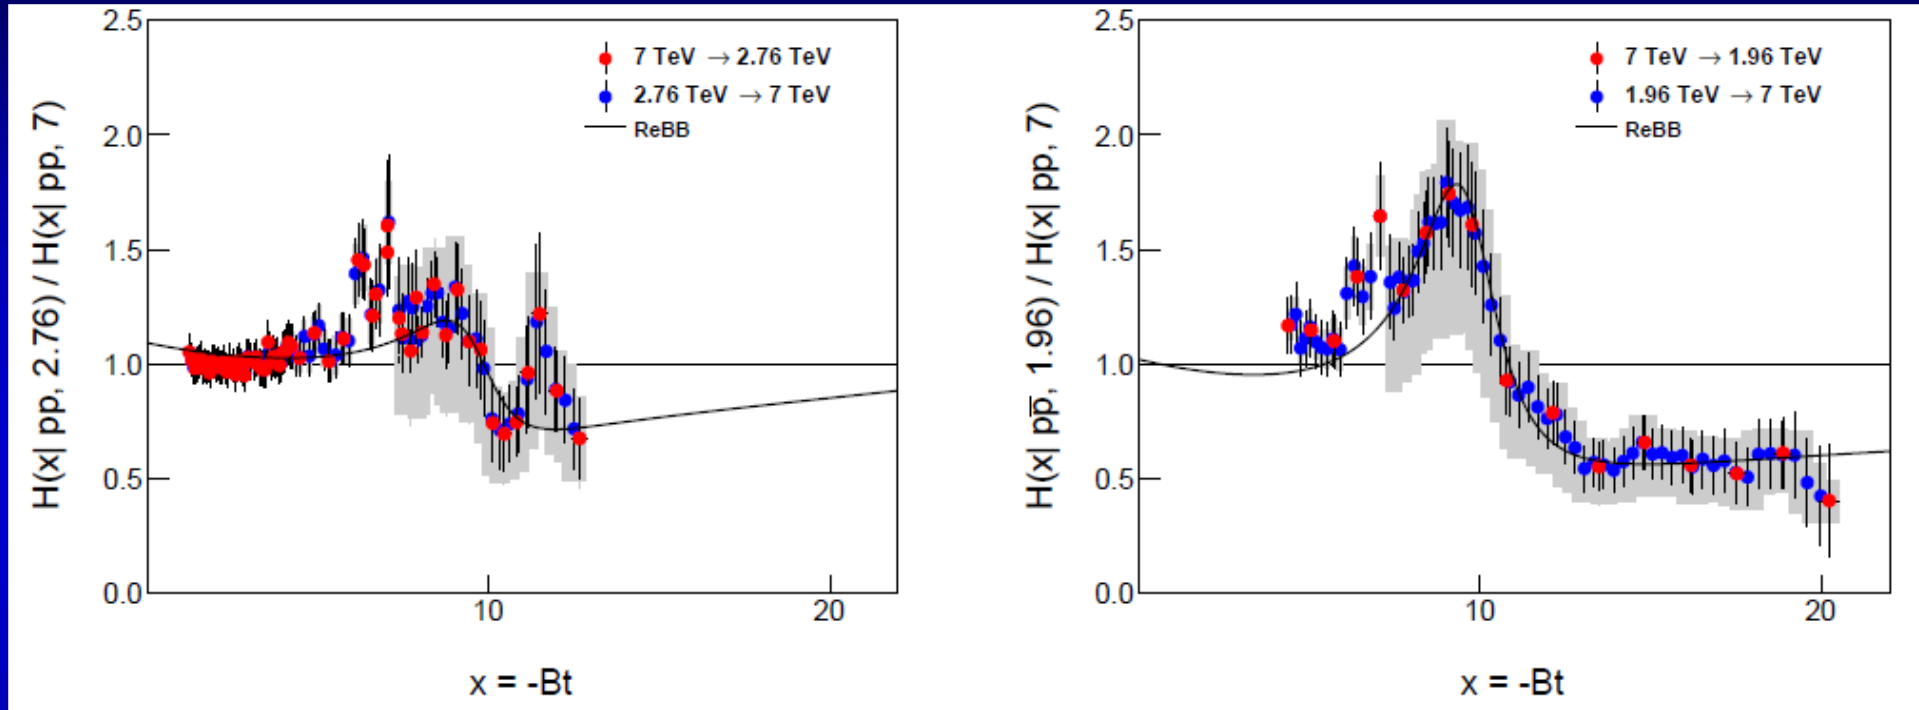

Ratio of pbarp to pp cross-sections @ 510 GeV
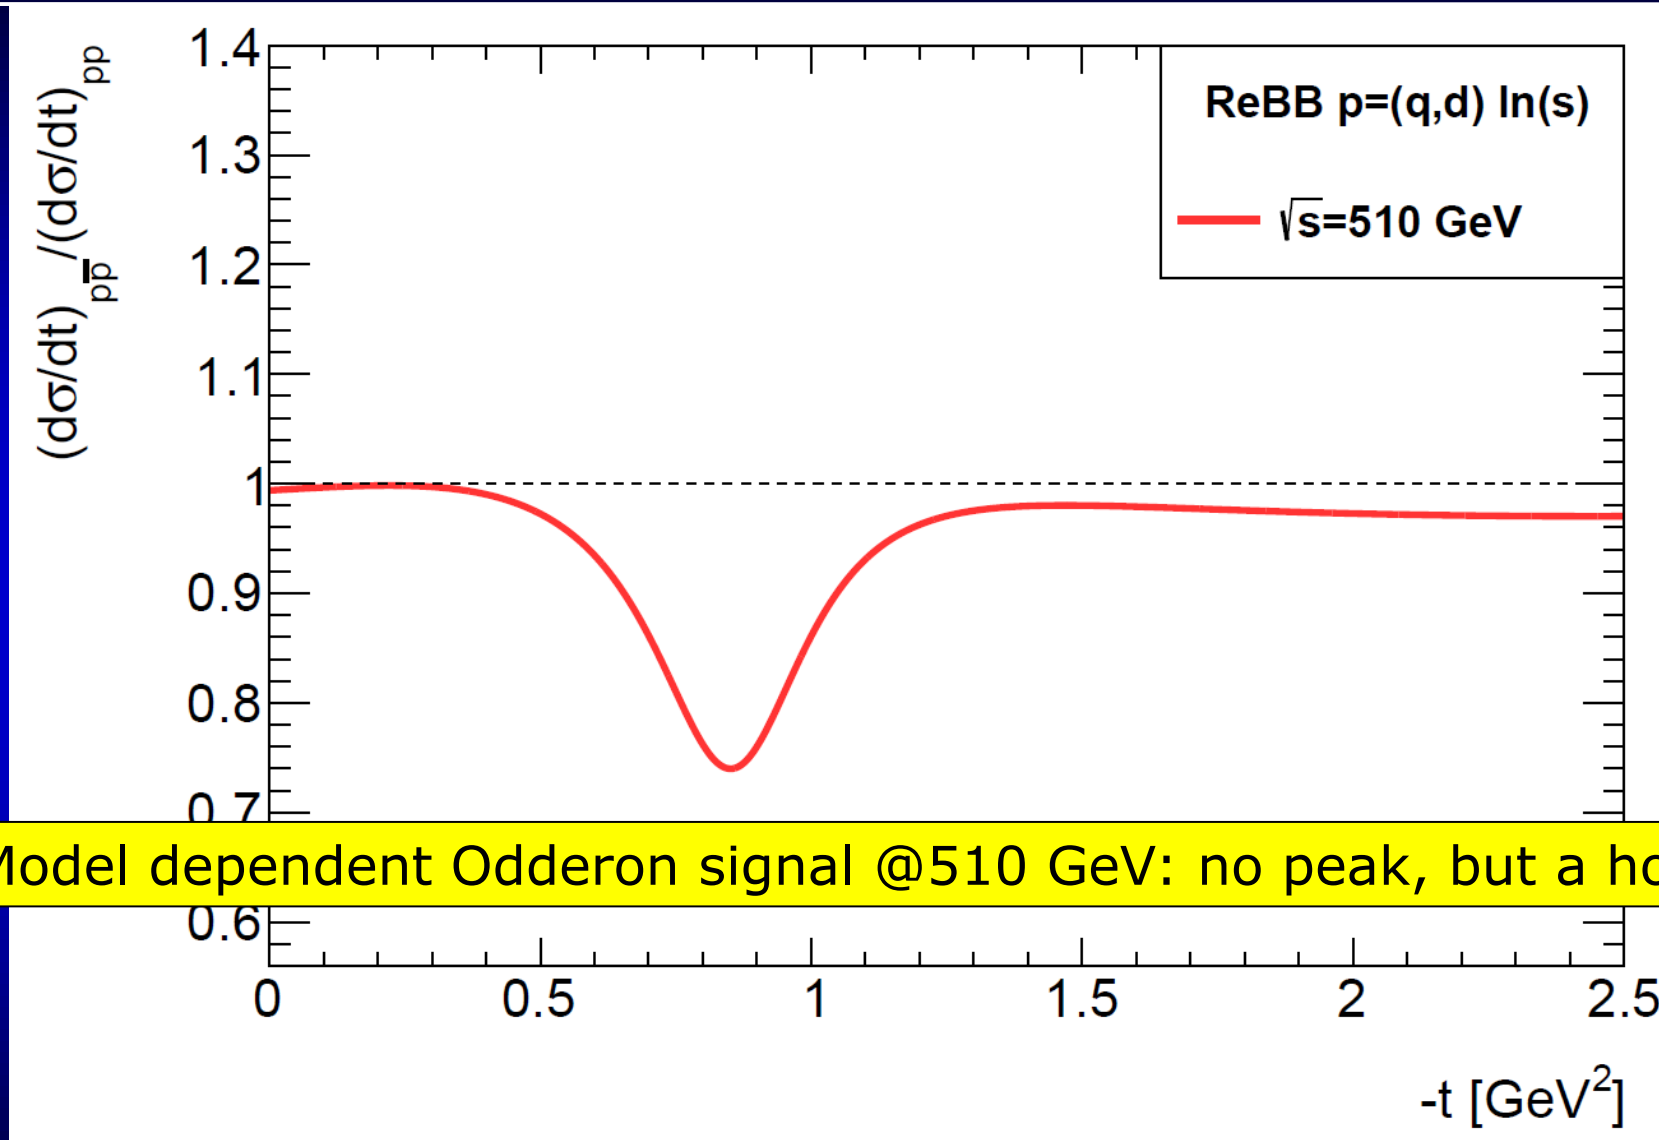

Model dependent Odderon signal @510 GeV: no peak, but a hole

Scaling violations: dominant @510 GeV
Model dependent Odderon signal: pbarp $d\sigma/dt$ ~ 25 % below pp !!
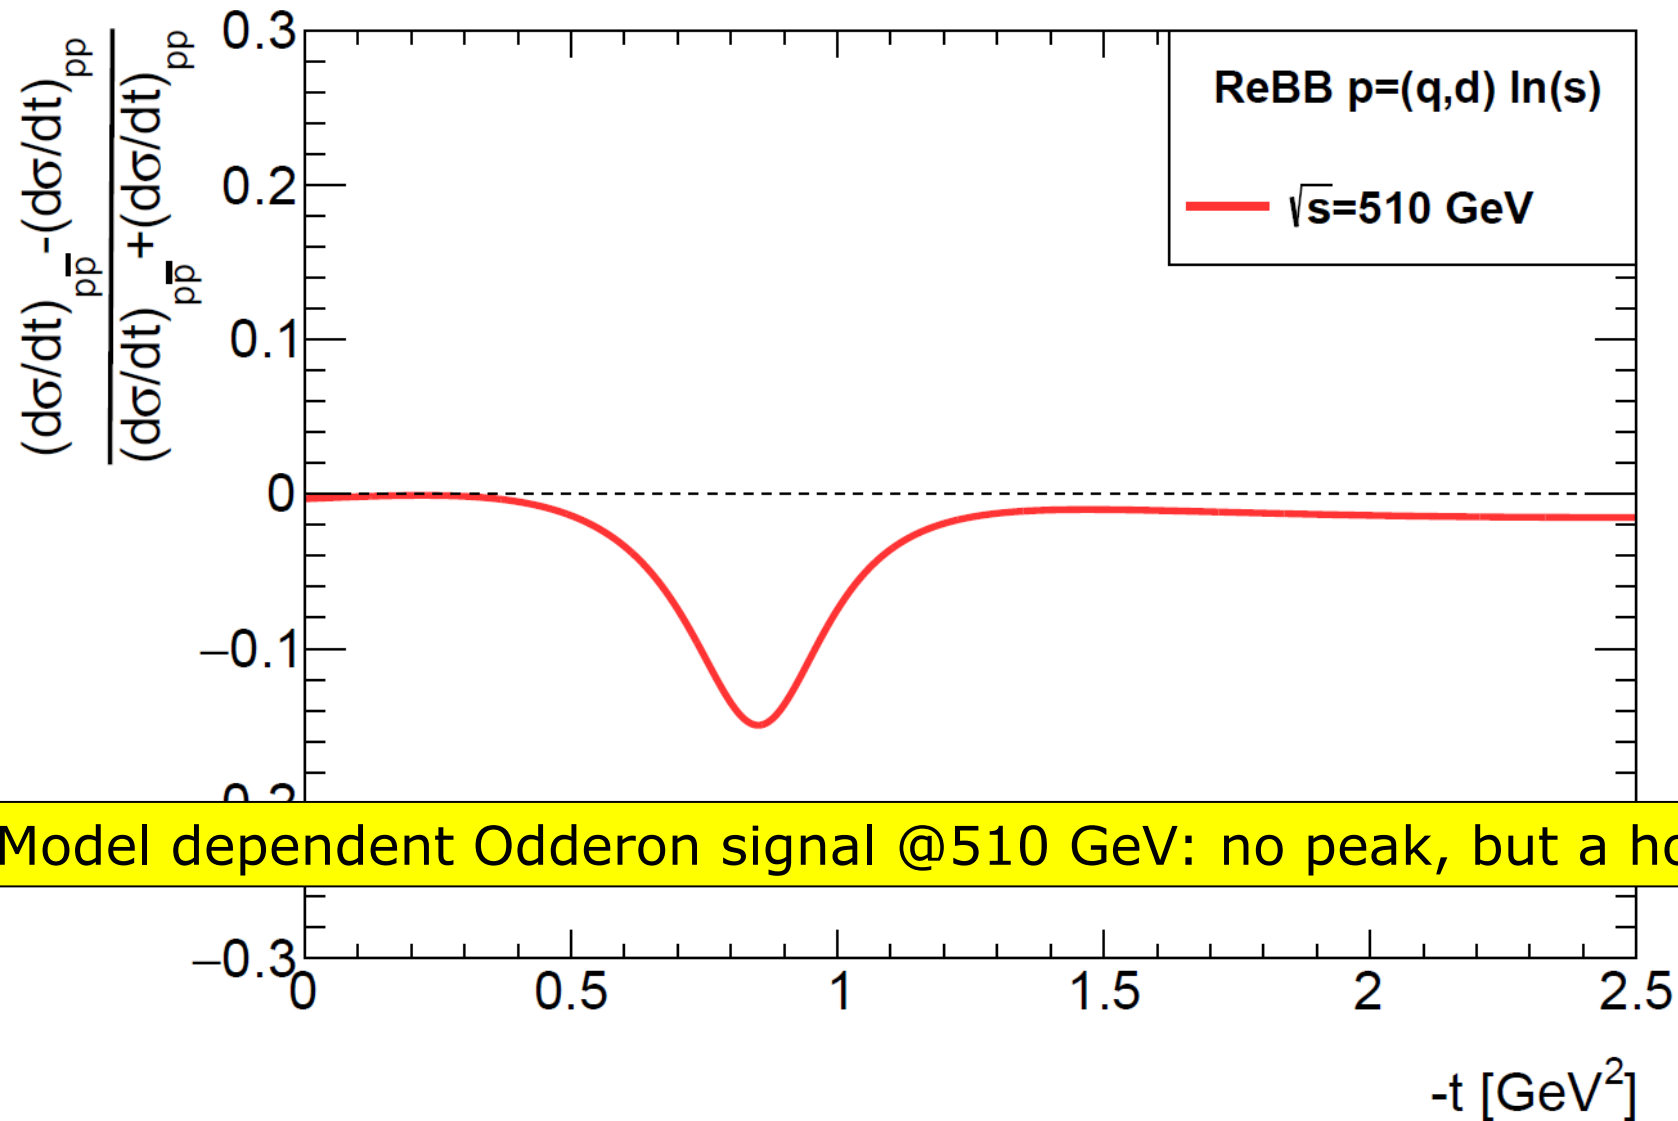

Model dependent Odderon signal @510 GeV: no peak, but a hole

Scaling violations: dominant @510 GeV
Model dependent Odderon signal: A ~ - 15 % @ -t ~ 0.85 GeV^2

An at least 6.26 σ Odderon effect

A discovery level, **model independent** Odderon effect at TeV scale.

New MODEL INDEPENT RESULT
Odderon signal at least 6.33 σ

The figure shows $d\sigma/dt$ (mb/GeV^2) versus $-t$ (GeV^2) with:
- $p\bar{p}$ 1.96 TeV - D0
- pp 7 TeV - TOTEM (rescaled)

7 TeV → 1.96 TeV ($\epsilon_{b,7TeV}$ = 0.11):
χ^2/NDF = 21.8 / 8, CL = 0.53%

1.96 TeV → 7 TeV ($\epsilon_{b,7TeV}$ = -0.13):
χ^2/NDF = 89.9 / 35, CL = 0.0001%

If we study $d\sigma/dt$ and limit **our analysis to the same range as D0/TOTEM:** Significance reduces to **5.01 σ effect**, due to leaving out 9 D0 points

If we add D0's 14.4 % overall correlated error to fluctuating errors, for all D0 data: Our *published* value is **3.27 σ**

If we conservatively optimize coefficient $\epsilon_{B,7TeV}$ of point-to-point correlated errors: **2.79 σ** **Significance of D0/TOTEM** for $d\sigma/dt$: **3.4 σ**

including our contributions

Comparison of pp and $p\bar{p}$ differential elastic cross sections and observation of the exchange of a [#1]
colorless C-odd gluonic compound

D0 and TOTEM Collaborations • V.M. Abazov (Dubna, JINR) et al. (Dec 7, 2020)

e-Print: 2012.03981 [hep-ex]

pdf   links   cite   1 citation

Submitted to PRL in December 2020.
Uses *13, 8,* 7 and 2.76 TeV TOTEM data,
limited in -t to the dip-bump structure.
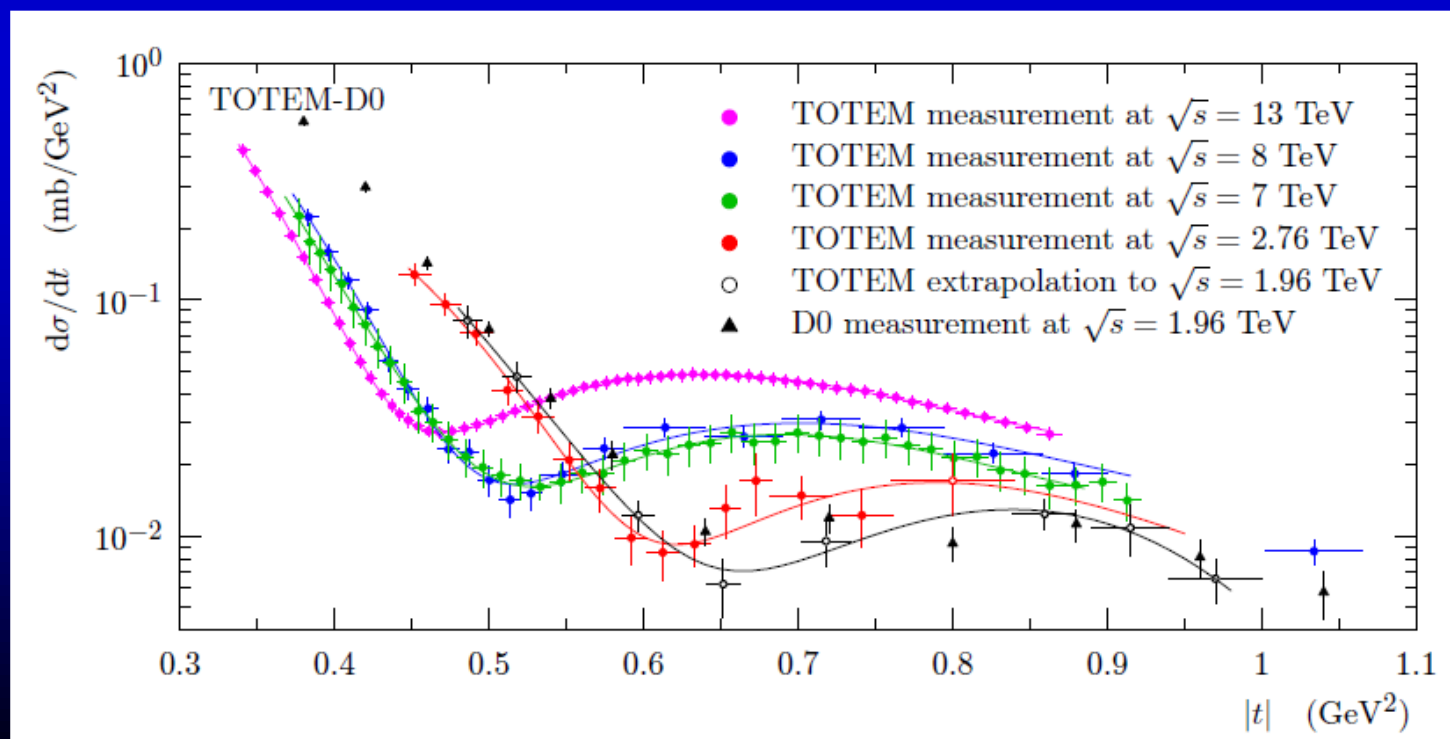

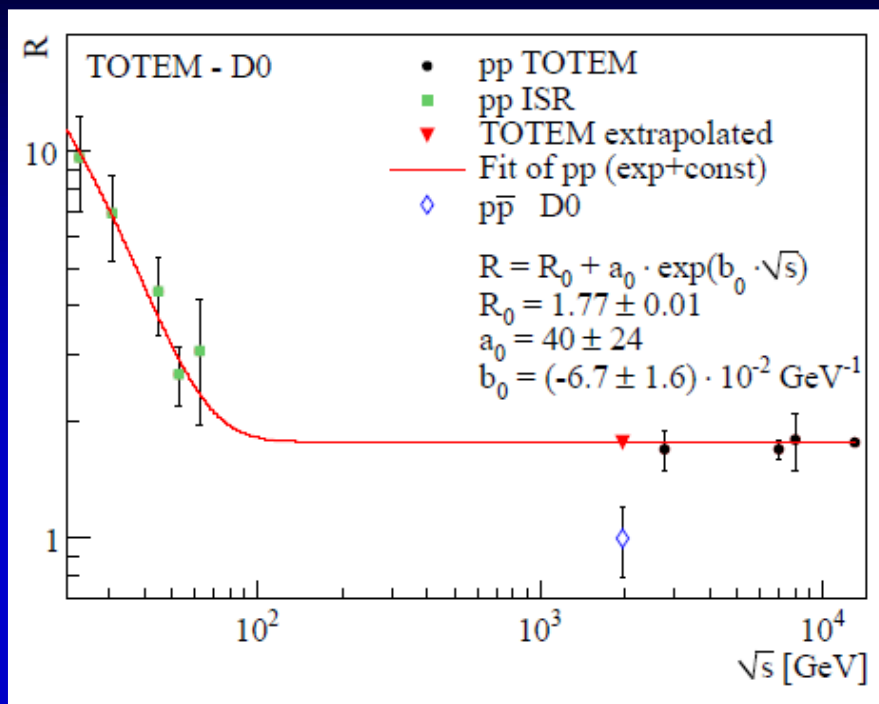

Our cross-test of Fig. 2 of arxiv:2012.03981:
Fits ISR and LHC data with *separate* lines
p_1^{LHC} = 0.034 ± 0.050

Consistent with 0 → fix it to 0!

R(pp) = 1.77 ± 0.01 @ 1.96 TeV

→ Reggeon effects negiligble @ 1.96 TeV, OK.

Fig. 2 of arxiv:2012.03981:
Fits ISR and LHC data with *same* curve

R(pp) = 1.77 ± 0.01 @ 1.96 TeV

Reggeon effects from ISR? Test this!
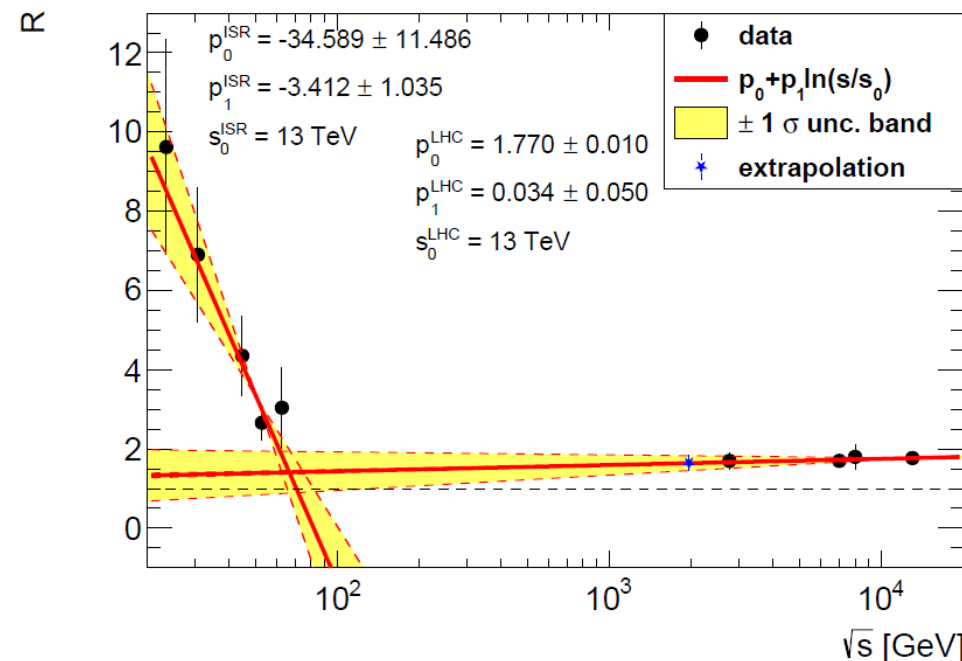

Our cross-test of
Fig. 3 of arxiv:2012.03981:
Fits to max(s) and min(s) neglect
the constraint of Fig. 2:

R(s|pp) = max(s|pp)/min(s|pp)
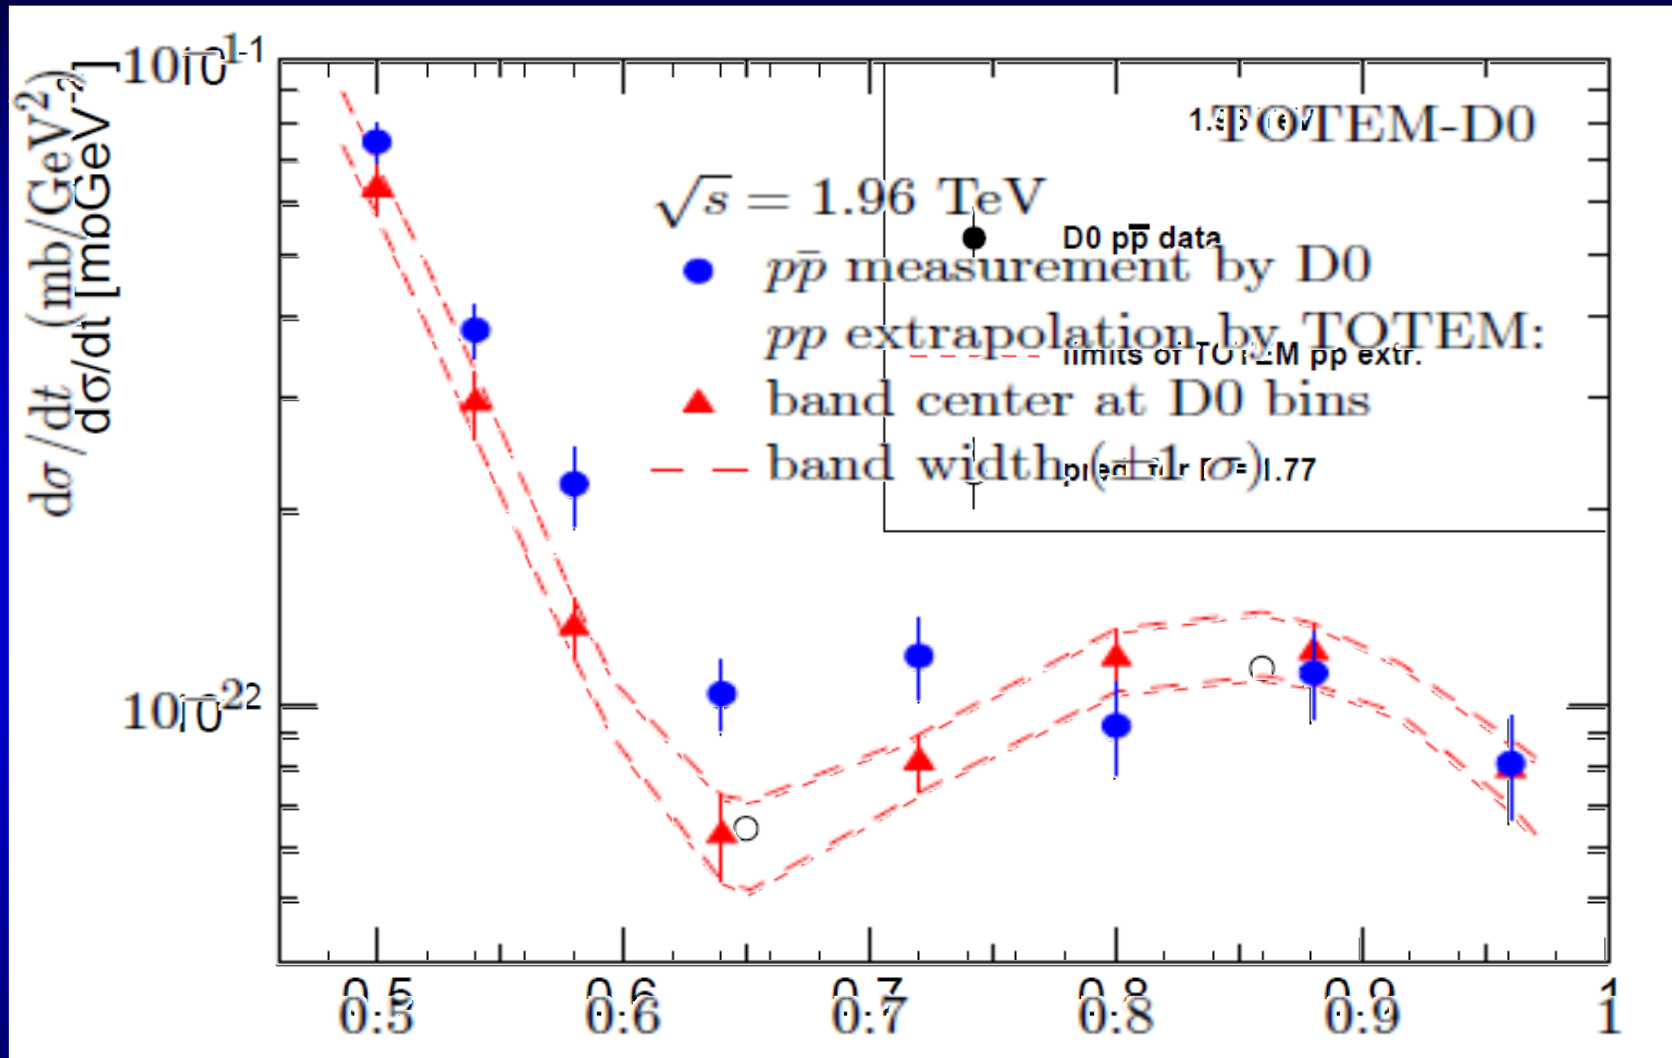

measured to be 1.77 ±0.01 !

What about constrained fits?

Only two out of three quantities can be fitted independently :
max(s), min(s) and R(s) = max(s) / min(s)
Red lines: min(s|pp) = max(s|pp)/R(s|pp) constrained fits
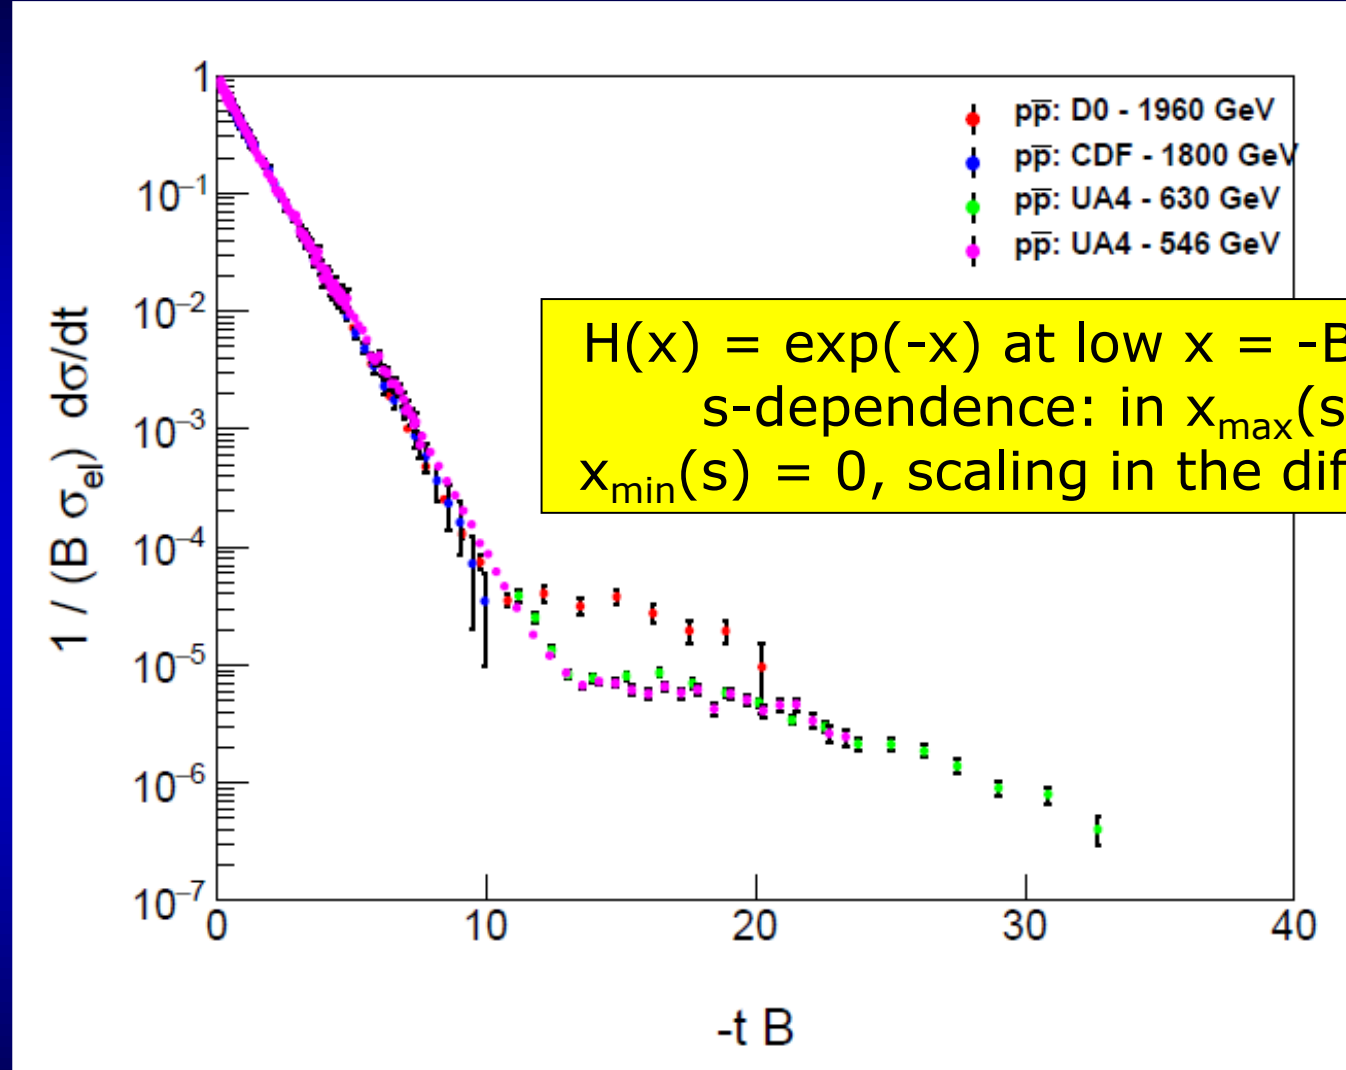

→ Fig. 3. of D0/TOTEM OK within 1 σ

Empty circles from min(s|pp) = max(s|pp)/R(s|pp) <u>constrained fits</u>

→ Fig. 5. of D0/TOTEM OK within 1 σ

H(x) = exp(-x) at low x = -Bt at ~ every s
s-dependence: in $x_{max}(s|p+antip)$
$x_{min}(s)$ = 0, scaling in the diffractive cone !

Energy range: 546 GeV – 1.96 TeV
Qualitatively different from pp: scaling in the cone only for p+antip

H(x) = exp(-x) at low x = -Bt at ~ every s
s-dependence: only $x_{max}(s)$
$x_{min}(s) \sim 0$ in the diffractive cone !
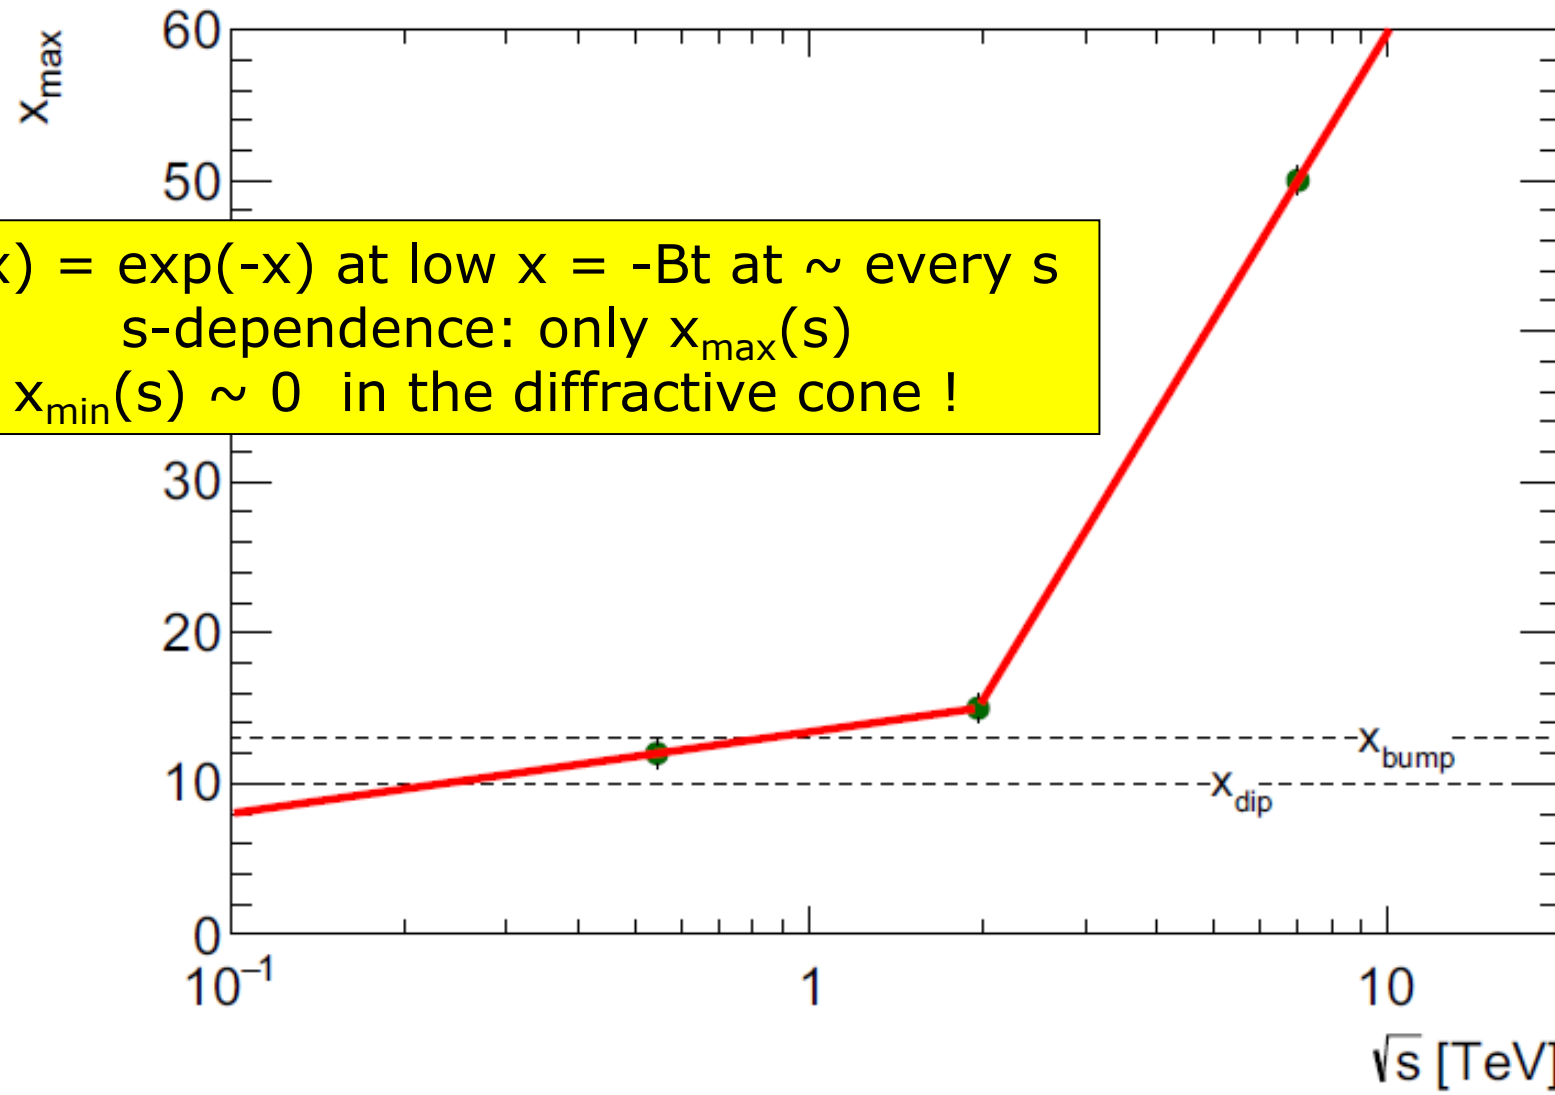

Energy range: 200 GeV – 8 TeV (nearly factor of 40)
With decreasing s, the x = -Bt range for H(x) scaling decreases

Where is the Odderon signal from?

Swing, interference, tail regions
Interference region is dominant

		Partial significances from the swing, interference, tail and all regions, characterized by $x_{min} < x \leq x_{max}$			
x_{min}	x_{max}	ε_{B21} of min $\Delta \chi^2$ in $x_{min} < x \leq x_{max}$	$\Delta \chi^2$ in $x_{min} < x \leq x_{max}$	NDF in $x_{min} < x \leq x_{max}$	σ in $x_{min} < x \leq x_{max}$

Model dependent evidence for Odderon

Structure:

Introduction,

Fits with CL > 0.1 % to published pp and pbarp data function

In the dip/bump region (large –t fits)

Linear excitation function in TeV range: $p_0 + p_1 \ln(s/s_0)$

Sanity tests: Validation of the trends

Extrapolations both for pp and pbarp data

Odderon significance from pp and pbarp comparisions

From combined 1.96 and 2.76 TeV analysis:

Odderon seen at 7.08 σ

Cross-checks (quadratic trend, ISR data)
