

# Heavy flavor measurements at RHIC

Sonia Kabana  
(Universidad de Tarapaca, Arica, Chile)

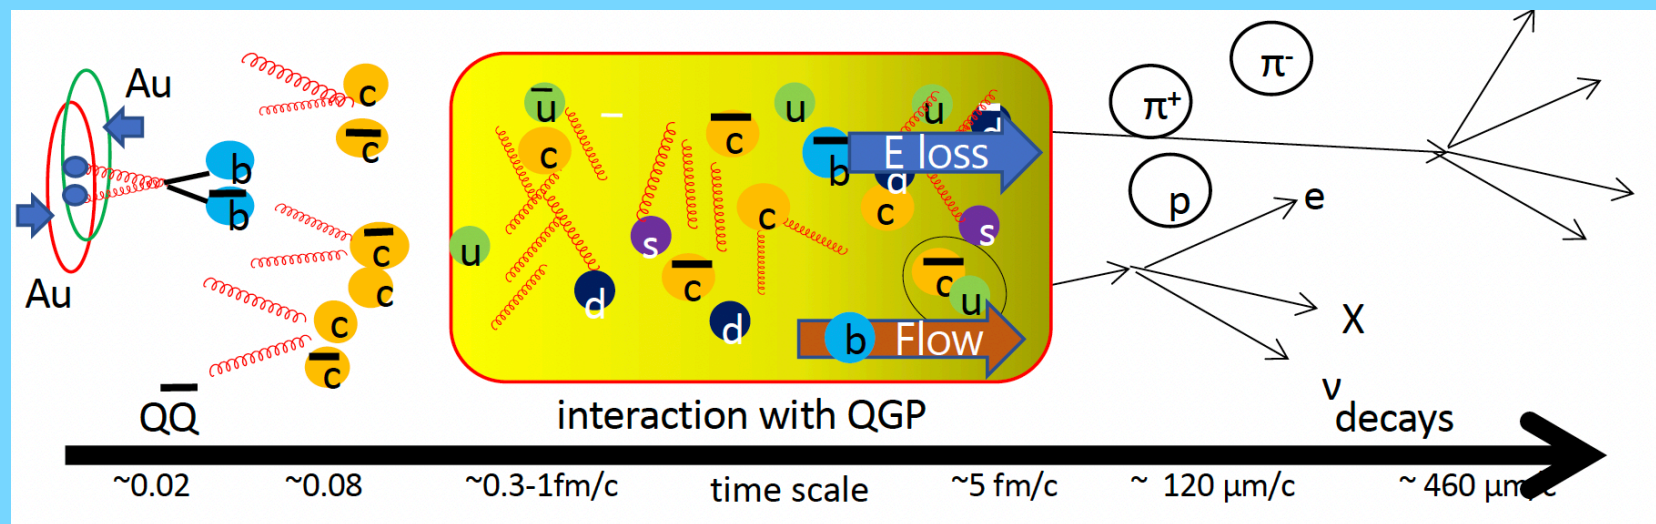

Diffraction and Low-x 2024, 8-14 September 2024,  
Hotel Tonnara Trabia, Palermo, Italy

# Outline

- \* Introduction
- \* Flow of HF in Au+Au
- \* Mass ordering of charm and beauty energy loss in Au+Au
- \* c and b in small systems
- \* Charmed hadrons
- \* Conclusions and outlook

# Introduction

- \* **Open heavy flavor:** Charm and beauty quarks are produced in initial hard scatterings and experience the entire evolution of  $A+A$  interactions
- \* **Flow of open heavy flavor hadrons** helps elucidate interaction of HF with medium, thermalization and production mechanisms of HF and probe sQGP properties

M. Shimomura, PHENIX, SQM2024

# Introduction

B. Kopeliovich, ISMD2023

\* Mass dependence of jet quenching in sQGP is expected

M.Djordjevic PRL 94 (2004)

B.Kopeliovich., I.Potashnikova,I.Schmidt, PRC 82(2010)037901

# Flow coefficients $v_n$ , $n=1,2,3..$

Matter in the overlapp area of two colliding nuclei gets compressed and heated  
Initial anisotropy gets transfered into the momentum space via pressure gradients

$$\frac{dN}{d\phi} \propto \mathbf{1} + 2 \sum_{n=1}^{\infty} v_n \cos[n(\phi - \Phi_n)]$$

$$v_n = \langle \cos[n(\phi - \Phi_n)] \rangle$$

$v$  : flow coefficients  
( $v_1$ : directed flow,  
 $v_2$ : elliptic flow, ...)

Higher harmonics

# Relativistic Heavy Ion Collider

at the Brookhaven Lab, Long Island, New York, USA

## Relativistic Heavy Ion Collider (RHIC)

**RHIC** has been exploring nuclear matter at extreme conditions since 2000

**4 experiments initially:**  
**STAR PHENIX**  
**BRAHMS PHOBOS**

**Still running: STAR**

**Still analysing data:**  
**PHENIX**  
**New: sPHENIX**

**Some of the colliding systems:**

p+p, d+Au, Cu+Cu, Au+Au  
Cu+Au, U+U, Zr+Zr, Ru+Ru

**Some of the energies A+A :**

$\sqrt{s_{NN}} = 62, 130, 200 \text{ GeV}$

and low energy scan

7.7, 11.5, 19.6, 22.4, 27, 39 GeV  
+ Fixed target

# The STAR Experiment at RHIC

Detectors used for open heavy flavor: Heavy Flavor Tracker (HFT), Time Projection Chamber (TPC), Barrel Electromagnetic Calorimeter (BEMC) Time-Of-Flight detector (TOF). Electron ( $e^+, e^-$ ) identification :  $\Delta(\phi)=4\pi$ ,  $|\eta|<1$

# The PHENIX Experiment at RHIC

Detectors used for open heavy flavor results:

-Central spectrometer arms :  
ring imaging Cerenkov detector (RICH), electromagnetic calorimeter (EMCal), Drift Chambers (DC), multi-wire proportional pad chambers (PC) and silicon Vertex detector (VTX).

Electron ( $e^+, e^-$ ) identification:  
 $|y| < 0.35$  and azimuthal angle  
 $\phi = 2\pi/2$

-Muon arms:  $1.2 < |y| < 2.2$ ,  
 $\phi = 2\pi/2$

Data taking completed in 2016

# Charm and Bottom flow in Au+Au collisions

# STAR heavy flavor decay electron elliptic flow ( $v_2$ ) in Au+Au collisions at 27, 54 (0-60%) compared to 200 GeV

STAR Collaboration, ArXiv 2303.03546, *Phys.Lett.B* 844 (2023) 138071

- \* The elliptic flow of heavy flavor electrons in Au+Au collisions at 54.4 GeV is comparable to 200 GeV, and non-zero above  $p_T$  0.5 GeV/c, indicating strong charm quark interactions with the medium
- \* The elliptic flow of heavy flavor electrons in Au+Au collisions at 27 GeV is consistent with zero at all  $p_T$  within large uncertainties
- \* The elliptic flow of heavy flavor electrons in Au+Au collisions at 54.4 GeV at high  $p_T$  is consistent with the expected  $v_2$  assuming that the c quark follows the Number of constituent Quark scaling

# STAR heavy flavor elliptic flow ( $v_2$ ) in Au+Au collisions at 27, 54 (0-60%) compared to 200 GeV

STAR Collaboration, ArXiv 2303.03546, *Phys.Lett.B* 844 (2023) 138071

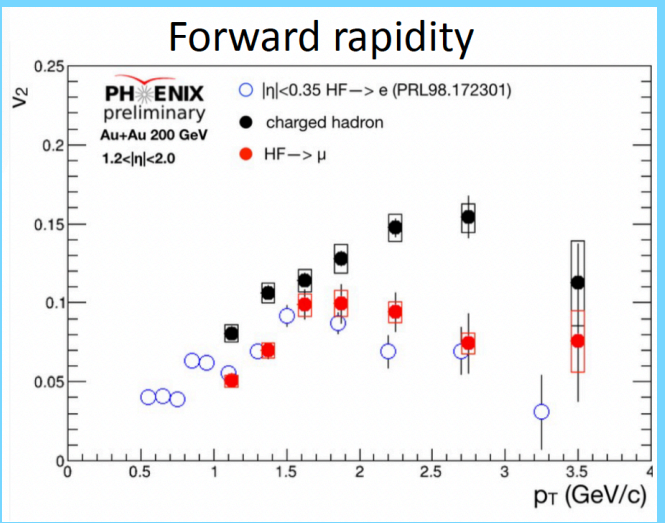

\* The elliptic flow of pions, phi, and  $D^0$  and heavy flavor electrons in Au+Au collisions at 54.4 GeV at  $\langle m_T - m_0 \rangle = 0.93$  GeV as a function of collision energy. The lines are for eye guidance.

\* Indication of a mass hierarchy of the energy dependence of  $v_2$ ; the  $v_2$  of heavier particles drops faster than lighter ones with decreasing collision energy

# PHENIX (preliminary) elliptic flow ( $v_2$ ) of electrons from charm and bottom decays in min. bias Au+Au 200 GeV

Forward rapidity  
HF (b+c)

Midrapidity  
charm

Midrapidity  
bottom

T Hachiya et al, PHENIX collaboration, QM2022  
M. Shimomura, SQM2024

- \*  $v_2$  of Heavy Flavor is positive at both midrapidity and at forward rapidity and mostly consistent
- \*  $v_2$  of hadrons is larger than  $v_2$  of charm
- \* hint of positive  $v_2$  of bottom → electrons ( $e^\pm$ ) (with  $\sim 1.1$  sigma)
- \*  $v_2$  of charm is larger than  $v_2$  of bottom -> Heavier quarks have less flow

# Strangeness and charm $v_2$

## STAR $D^0$ $v_2$ from STAR Heavy Flavor Tracker

L. Adamczyk et al, STAR, Phys. Rev. Lett. 118, 212301 (2017), 1701.06060

### Mass ordering

### NCQ scaling

$v_2$  of  $D^0$  in Au+Au follows Number-of-Constituent-Quarks scaling of other hadrons  
-> Evidence for thermalization of u,d,s,c mesons

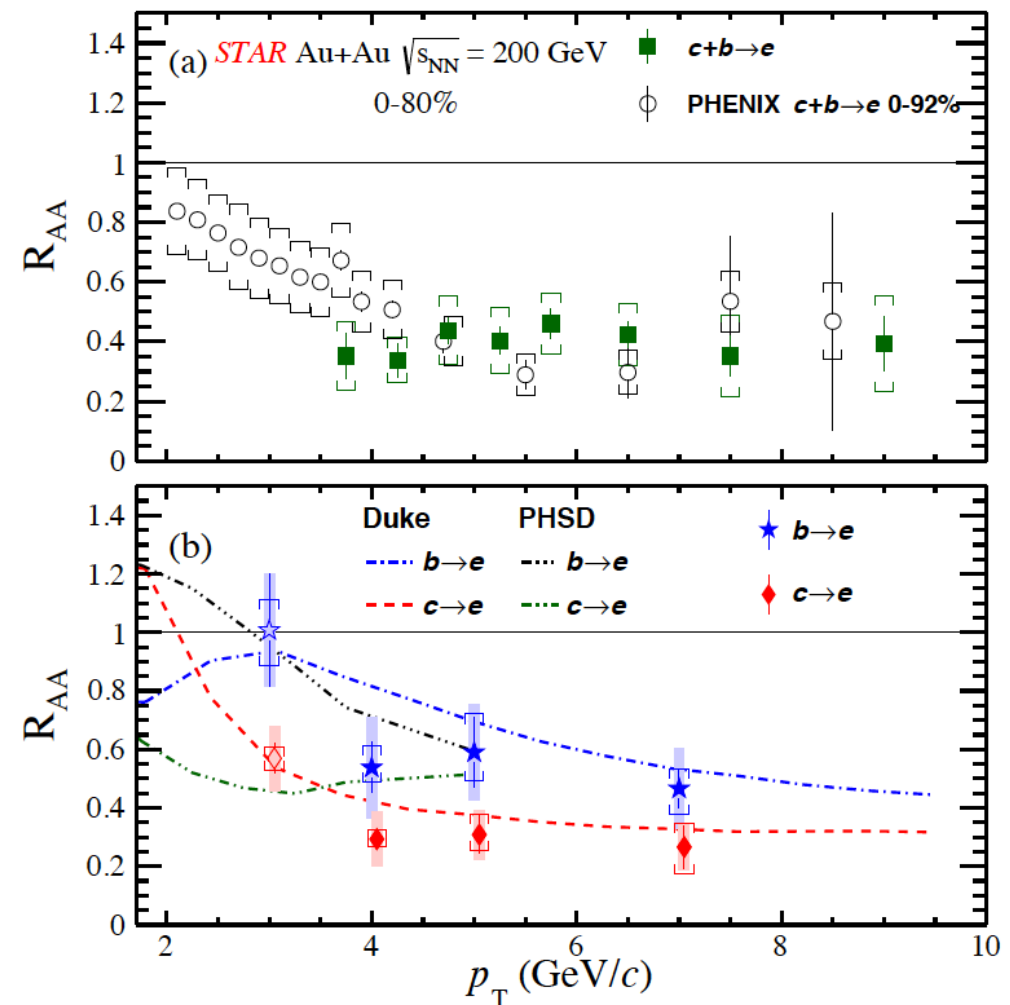

# Evidence of Mass Ordering of Charm and Bottom Quark Energy Loss in Au+Au Collisions

# STAR Evidence of Mass Ordering of Charm and Bottom Quark Energy Loss in Au+Au Collisions

STAR Collaboration, EPJC 82 (2022) 1150, arXiv:2111.14615

PHENIX Collaboration, PRC93, 034904 (2016), 1509.04662

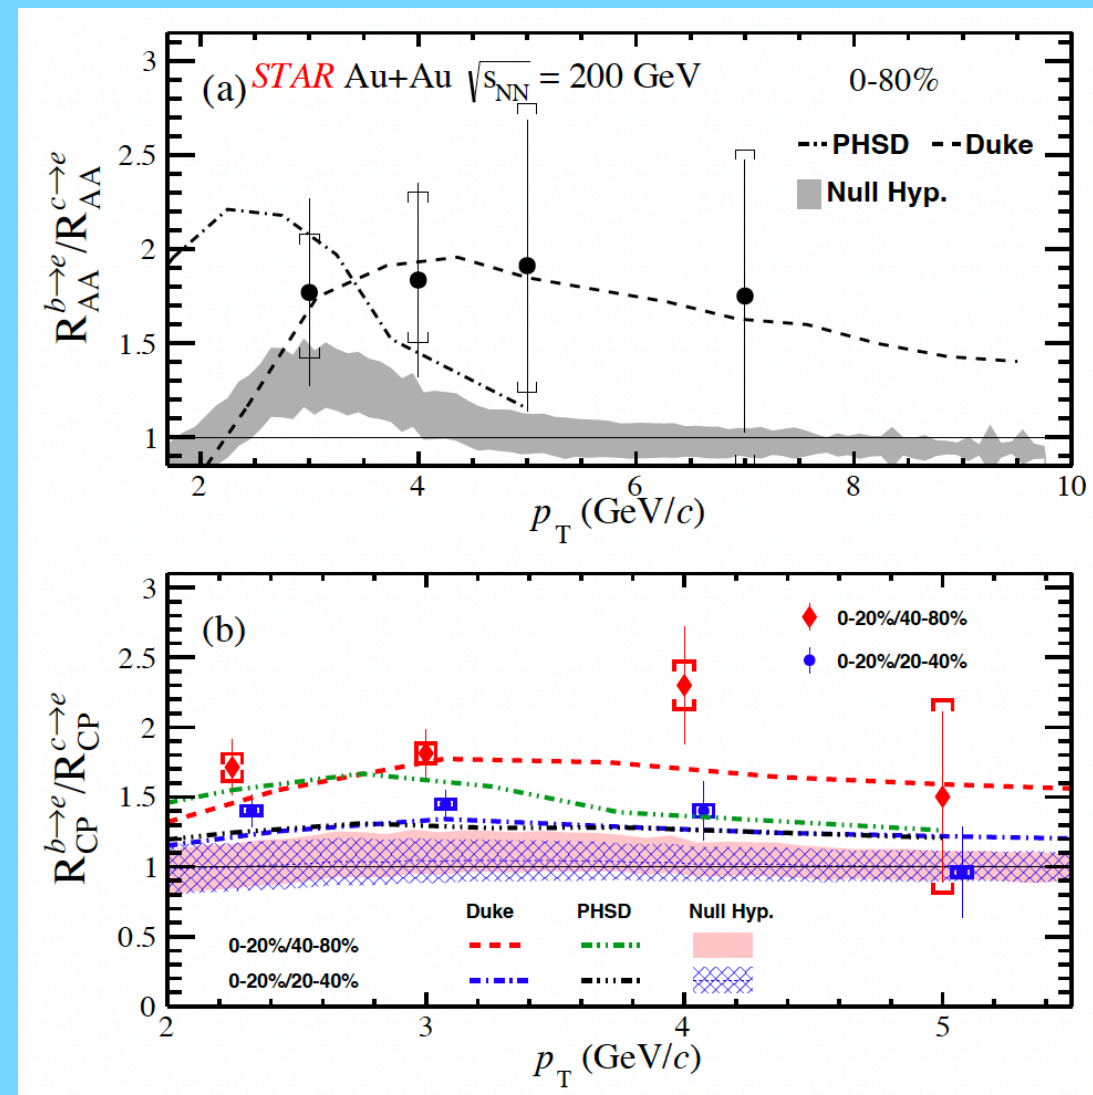

- \* PHSD: Parton-Hadron-String-Dynamics model
- \* Duke: modified Langevin transport model
- \* Both models include heavy quark (HQ) diffusion in the QGP medium, HQ hadronization through coalescence and fragmentation and mass-dependent energy loss mechanisms
- \* Data consistent with model predictions
- \*  **$R_{AA}$  vs  $p_T$  of  $c+b \rightarrow e$  in AuAu 0-80%: STAR and PHENIX are consistent**
- \* **Evidence of mass ordering of  $R_{AA}$  of electrons from bottom and charm in Au+Au collisions at 200 GeV is observed**
- \* **Results are consistent with models including mass-dependent energy loss mechanisms**

# STAR Evidence of Mass Ordering of Charm and Bottom Quark Energy Loss in Au+Au Collisions

STAR Collaboration, EPJC 82 (2022) 1150, arXiv:2111.14615

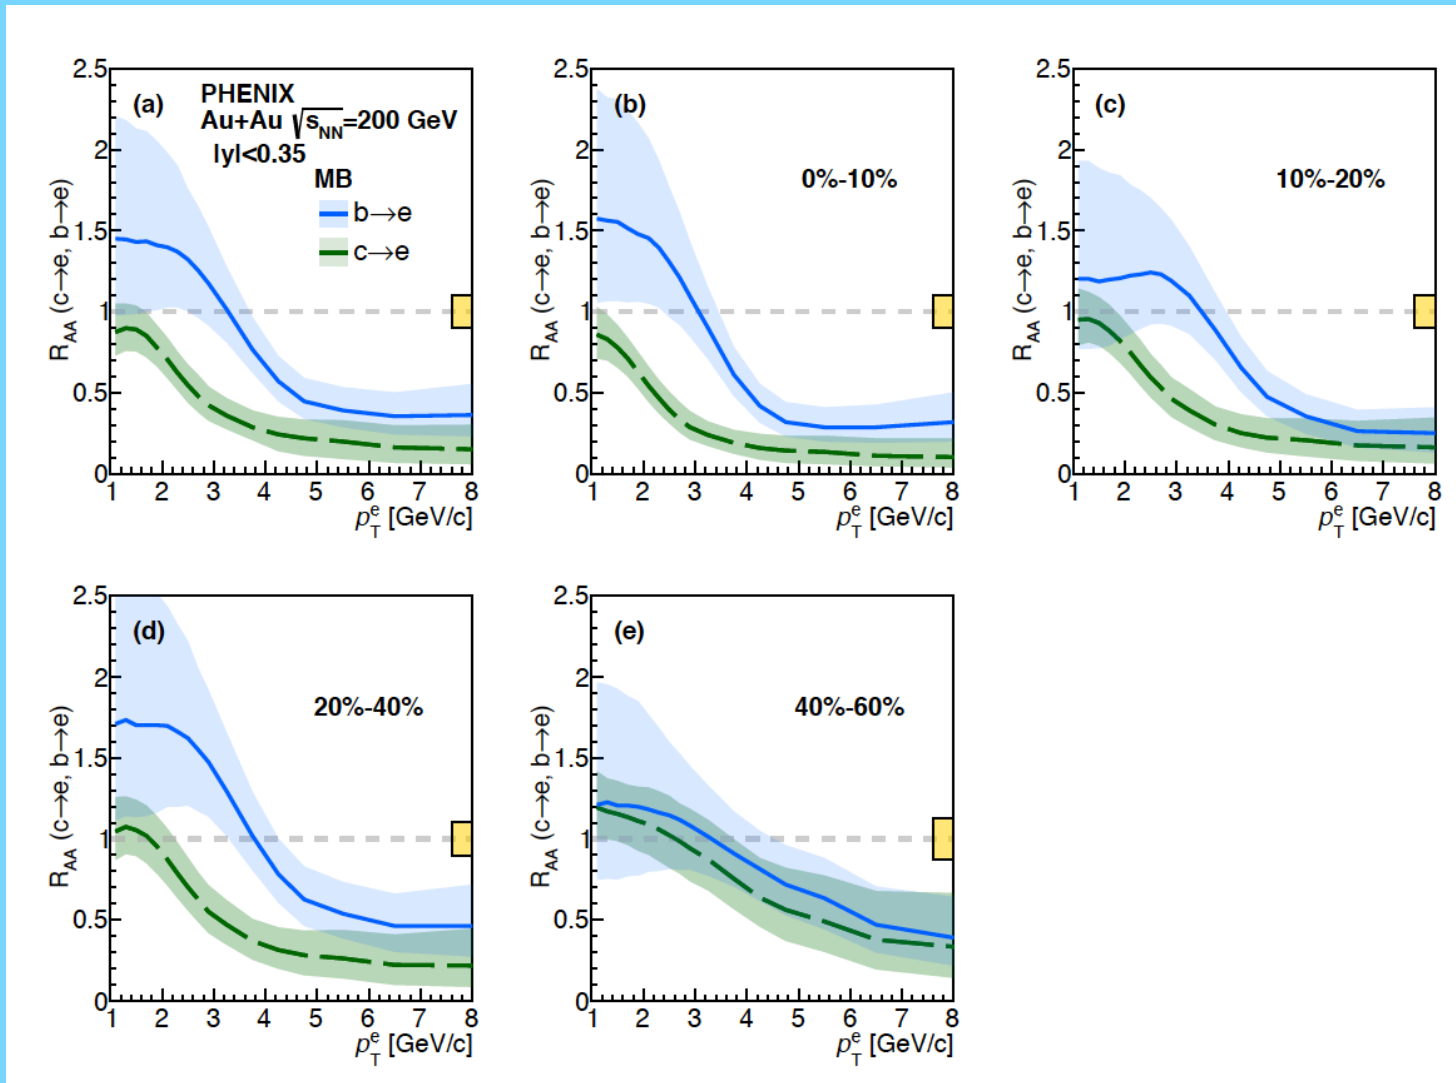

- \* Ratios of  $R(\text{AA})$  and  $R(\text{CP})$  of bottom- $\rightarrow$ e to charm- $\rightarrow$ e vs  $p_T$
- \* The  $R(\text{CP})$  ratios of b- $\rightarrow$ e and c- $\rightarrow$ e for (0-20%)/(40-80%) show a significant deviation from unity

# PHENIX hierarchy of suppression of $b \rightarrow e$ and $c \rightarrow e$ in Au+Au collisions at 200 GeV

U.H.Acharya et al (PHENIX Collaboration) Charm- and Bottom-Quark Production in Au+Au Collisions at  $\sqrt{s_{NN}} = 200$  GeV, 2203.17058

\*  $b \rightarrow e$  higher than  $c \rightarrow e$  in Au+Au 200 GeV Minimum Bias and various centralities except the most peripheral collisions

# PHENIX vs STAR Minimum Bias Au+Au

M. S. Abdallah et al. (STAR Collaboration), Evidence of Mass Ordering of Charm and Bottom Quark Energy Energy Loss in Au+Au Collisions at RHIC, arXiv:2111.14615.

U.H.Acharya et al (PHENIX Collaboration) Charm- and Bottom-Quark Production in Au+Au Collisions at  $\sqrt{s_{NN}} = 200$  GeV, 2203.17058

\* STAR (points) and PHENIX (lines) b and c to electron measurements in Minimum Bias Au+Au 200 GeV are consistent

# PHENIX vs Models, 0-10% Au+Au

U.H.Acharya et al (PHENIX Collaboration) Charm- and Bottom-Quark Production in Au+Au Collisions at  $\sqrt{s_{NN}} = 200$  GeV, 2203.17058

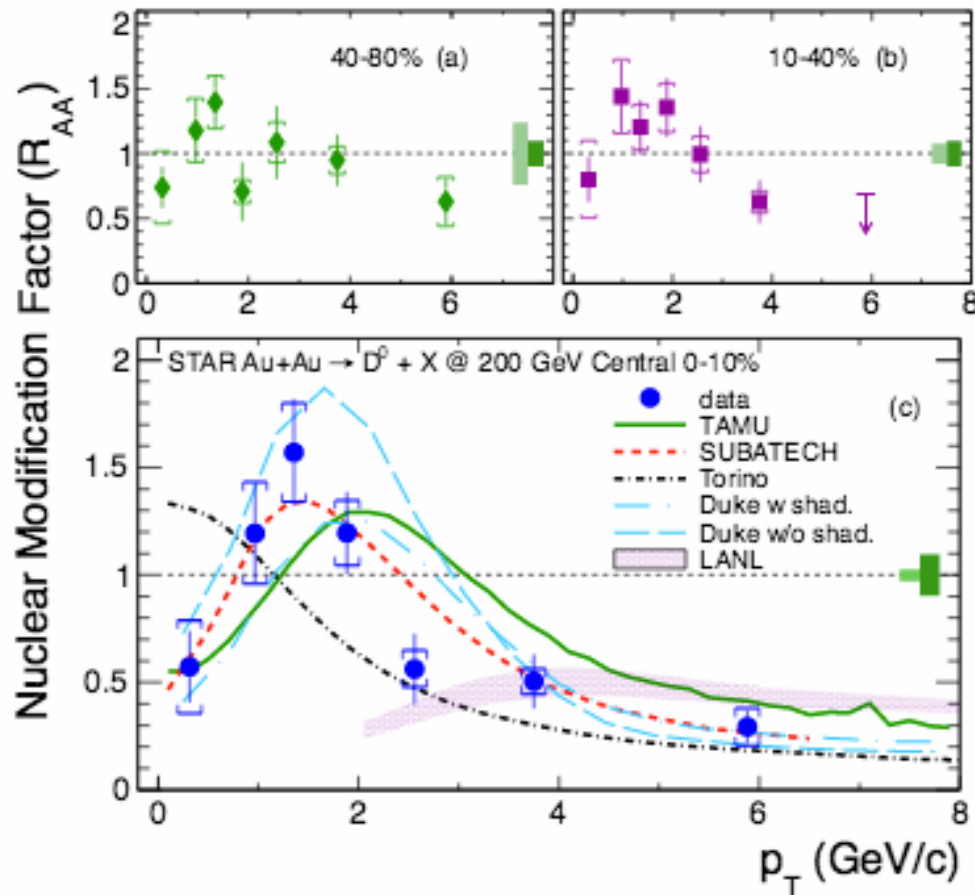

- \* T-Matrix approach is assuming formation of a hadronic resonance by a heavy quark in the QGP based on lattice quantum chromodynamics.
- \* The SUBATECH model employs a hard thermal loop calculation for the collisional energy loss.
- \* The DGLV model calculates both the collisional and radiative energy loss assuming an effectively static medium (shown for  $p_T > 5$  GeV).

- \* All shown models expect a quark mass ordering for the energy loss in the QGP medium, as observed in the data.
- \* The measured bottom nuclear modification is larger than the calculations at  $p_T$  2 to 4 GeV/c.

# STAR $R_{AA}$ of $D_0$ in Au+Au 200 GeV

STAR: Phys. Rev. Lett. **113** (2014) 142301 and 1404.6185

$R_{AA}$  of  $D_0$  at high  $p_T$ :

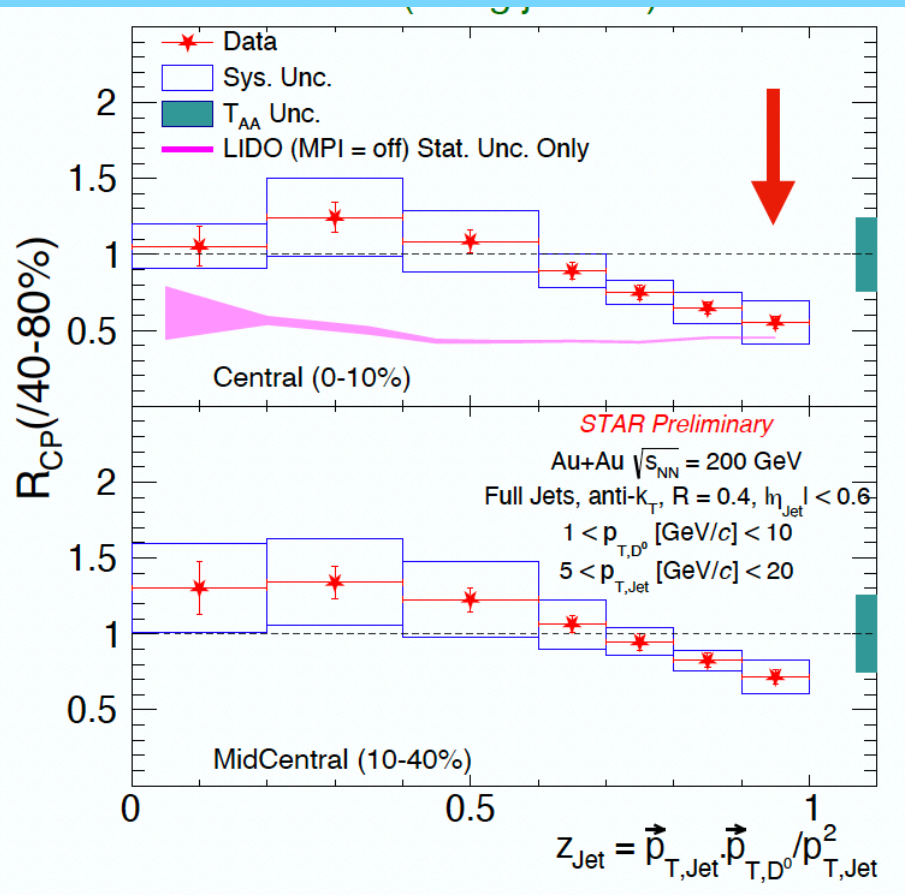

- $R_{AA}$   $D_0$  suppression in central Au+Au 200 GeV
- suppression at high  $p_T$  similar to pions
- Enhancement at  $p_T \sim 0.7-2$  GeV (described eg by models with charm quark coalescence with light quarks)

# D0 tagged jet measurements

# STAR D<sup>0</sup> tagged jet measurements in Au+Au 200 GeV

Fragmentation function modification  
(along jet axis)

Radial profile modification  
(perpendicular to jet axis)

O. Lomicky et al, STAR, SQM2024

$$\Delta r = \sqrt{(\eta_{Jet} - \eta_{D^0})^2 + (\phi_{Jet} - \phi_{D^0})^2}$$

- \* Suppression of hard fragmented charm jets in central collisions 0-10% AuAu
- \* Consistent radial profile from central to peripheral collisions, no hint of modification of radial profile

# $D^0$ - hadron femtoscopy

# STAR D<sup>0</sup> - hadron femtosopic correlation measurements in Au+Au 200 GeV

$$C(\vec{k}^*) = \mathcal{N} \frac{A(\vec{k}^*)}{B(\vec{k}^*)}$$

A: correlated pairs

B: uncorrelated pairs (from mixed events)

$k^*$ : reduced momentum difference

$$k^* = \frac{1}{2} (p_1 - p_2)$$

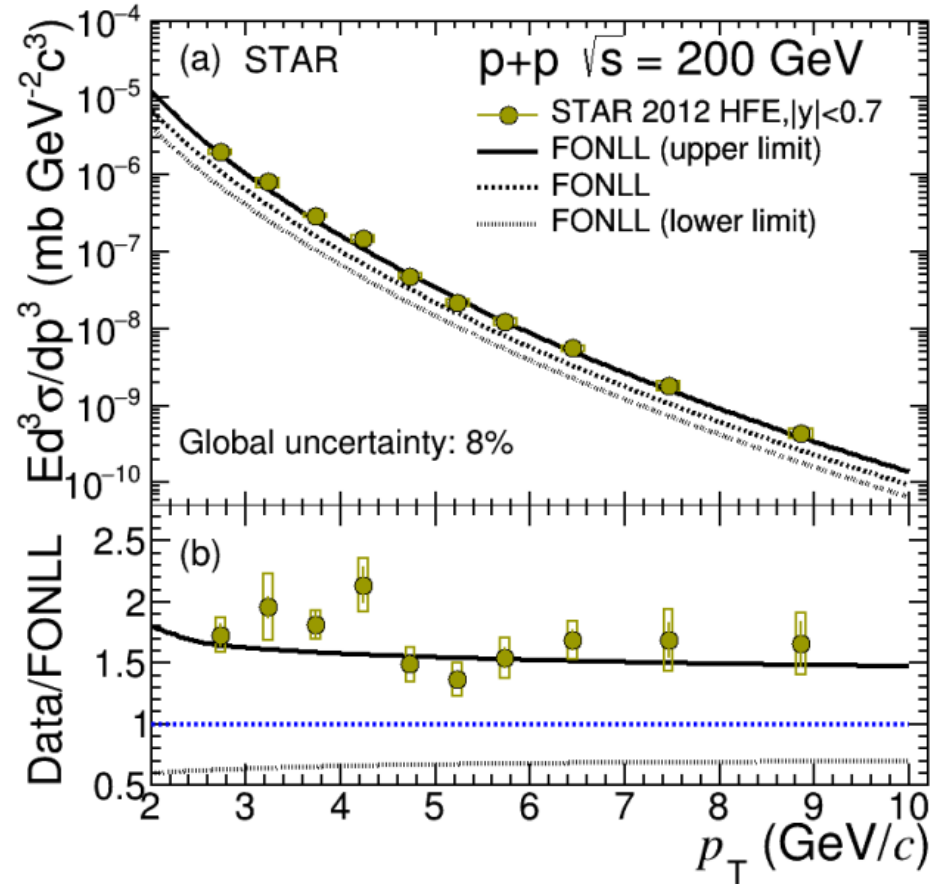

P. Roy et al, STAR, SQM2024

- \* No significant correlation measured for D<sup>0</sup>-pi pair
- \* Data on D<sup>0</sup>-pi correlation are consistent with calculations with a large emission source size

# Charm and Bottom via semileptonic decays in small systems

# HF $\rightarrow$ electrons in p+p collisions at 200 GeV

STAR Collaboration, Phys.Rev.D 105 (2022) 3, 032007, e-Print: 2109.13191 [nucl-ex]

Results from STAR and PHENIX agree

HF decays in p+p collisions at 200 GeV is qualitatively consistent with the upper limit of FONLL calculations

# PHENIX (2019) bottom cross section in p+p collisions at 200 GeV

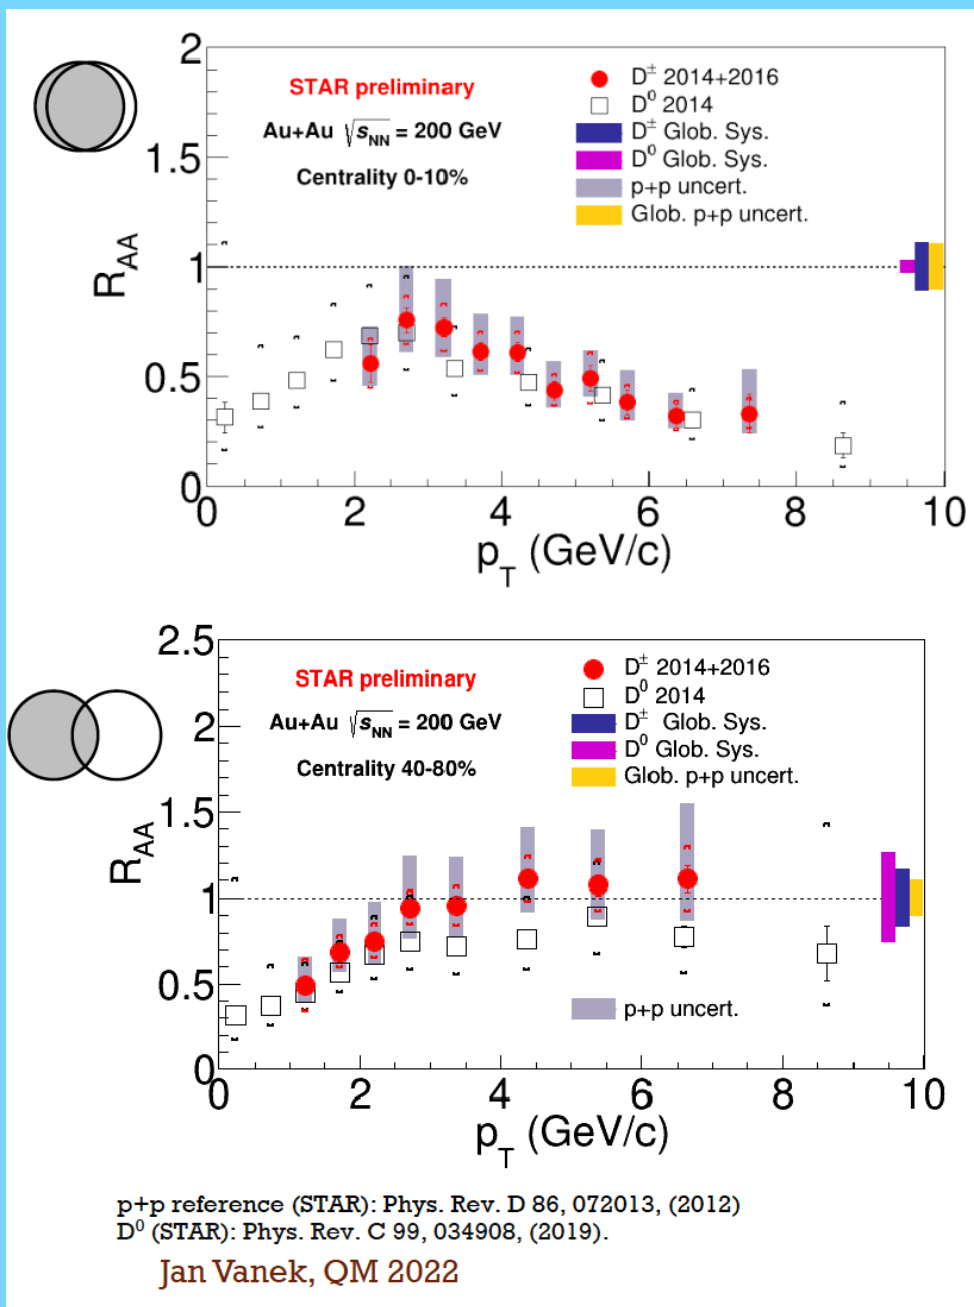

Measurements of  $\mu\mu$  pairs from open heavy flavor and Drell-Yan in p+p collisions at  $\sqrt{s}=200$  GeV  
 PHENIX Collaboration, C. Aidala(Michigan U.) et al. (May 7, 2018)  
 Phys.Rev.D 99 (2019) 7, 072003 • e-Print: 1805.02448 [hep-ex]

\* At low energy models are less consistent with data

# Charmed hadrons in Au+Au collisions

# STAR (preliminary) Charmed hadrons: $D^{+/-}$ and $D^0$ measurement

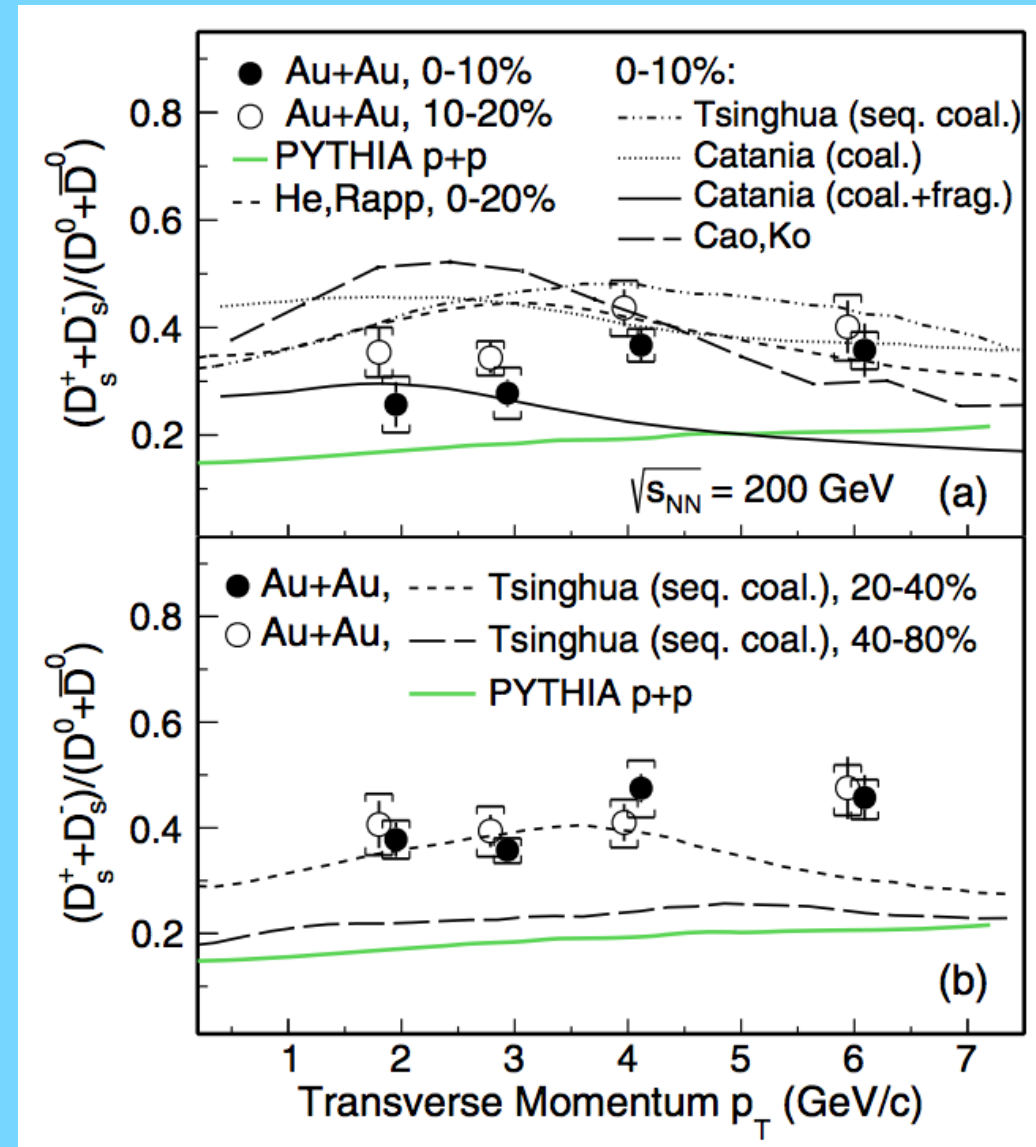

J. Vanek et al, STAR Collaboration, QM2022

- \* Centrality dependence of  $R_{AA}$  of  $D^{+/-}$  and  $D^0$  measured
- \*  $R_{AA}$  of  $D^{+/-}$  and  $D^0$  are consistent with each other and suppressed at high  $p_T$  in central (0-10%) Au+Au collisions

# STAR, $\Lambda_c$ and $D_s$ measurements

STAR Collaboration, PRL 124 (2020) 17, 172301

STAR Collaboration, Phys. Rev. Lett. 127, (2021), 092301

- \*  $\Lambda_c/D^0$  and  $D_s/D^0$  ratios in 200 GeV Au+Au are higher than PYTHIA
- \* Data are in accordance with models that include coalescence hadronization of charm hadrons

# Conclusions and Outlook

- \* Flow ( $v_2$ ) results suggest strong interaction of heavy quarks with medium above  $\sqrt{s}=27$  GeV Au+Au
- \* Flow ( $v_2$ ) of charm higher than  $v_2$  of bottom.
- \* Evidence for mass ordering of bottom and charm (measured via  $b, c \rightarrow e$ ) in Au+Au 200 GeV has been observed at RHIC
- \*  $\Lambda(c), D$  in agreement with assumption of coalescence

# Outlook

## STAR and sPHENIX run period

sPHENIX BUP2022 [sPH-TRG-2022-001], 24 (& 28) cryo-week scenarios

Year	Species	$\sqrt{s_{NN}}$ [GeV]	Cryo Weeks	Physics Weeks	Rec. Lum. $ z  < 10$ cm	Samp. Lum. $ z  < 10$ cm
2023	Au+Au	200	24 (28)	9 (13)	3.7 (5.7) nb <sup>-1</sup>	4.5 (6.9) nb <sup>-1</sup>
2024	$p^\uparrow p^\uparrow$	200	24 (28)	12 (16)	0.3 (0.4) pb <sup>-1</sup> [5 kHz] 4.5 (6.2) pb <sup>-1</sup> [10%-str]	45 (62) pb <sup>-1</sup>
2024	$p^\uparrow$ +Au	200	–	5	0.003 pb <sup>-1</sup> [5 kHz] 0.01 pb <sup>-1</sup> [10%-str]	0.11 pb <sup>-1</sup>
2025	Au+Au	200	24 (28)	20.5 (24.5)	13 (15) nb <sup>-1</sup>	21 (25) nb <sup>-1</sup>

\* sPHENIX: commissioned

# sPHENIX

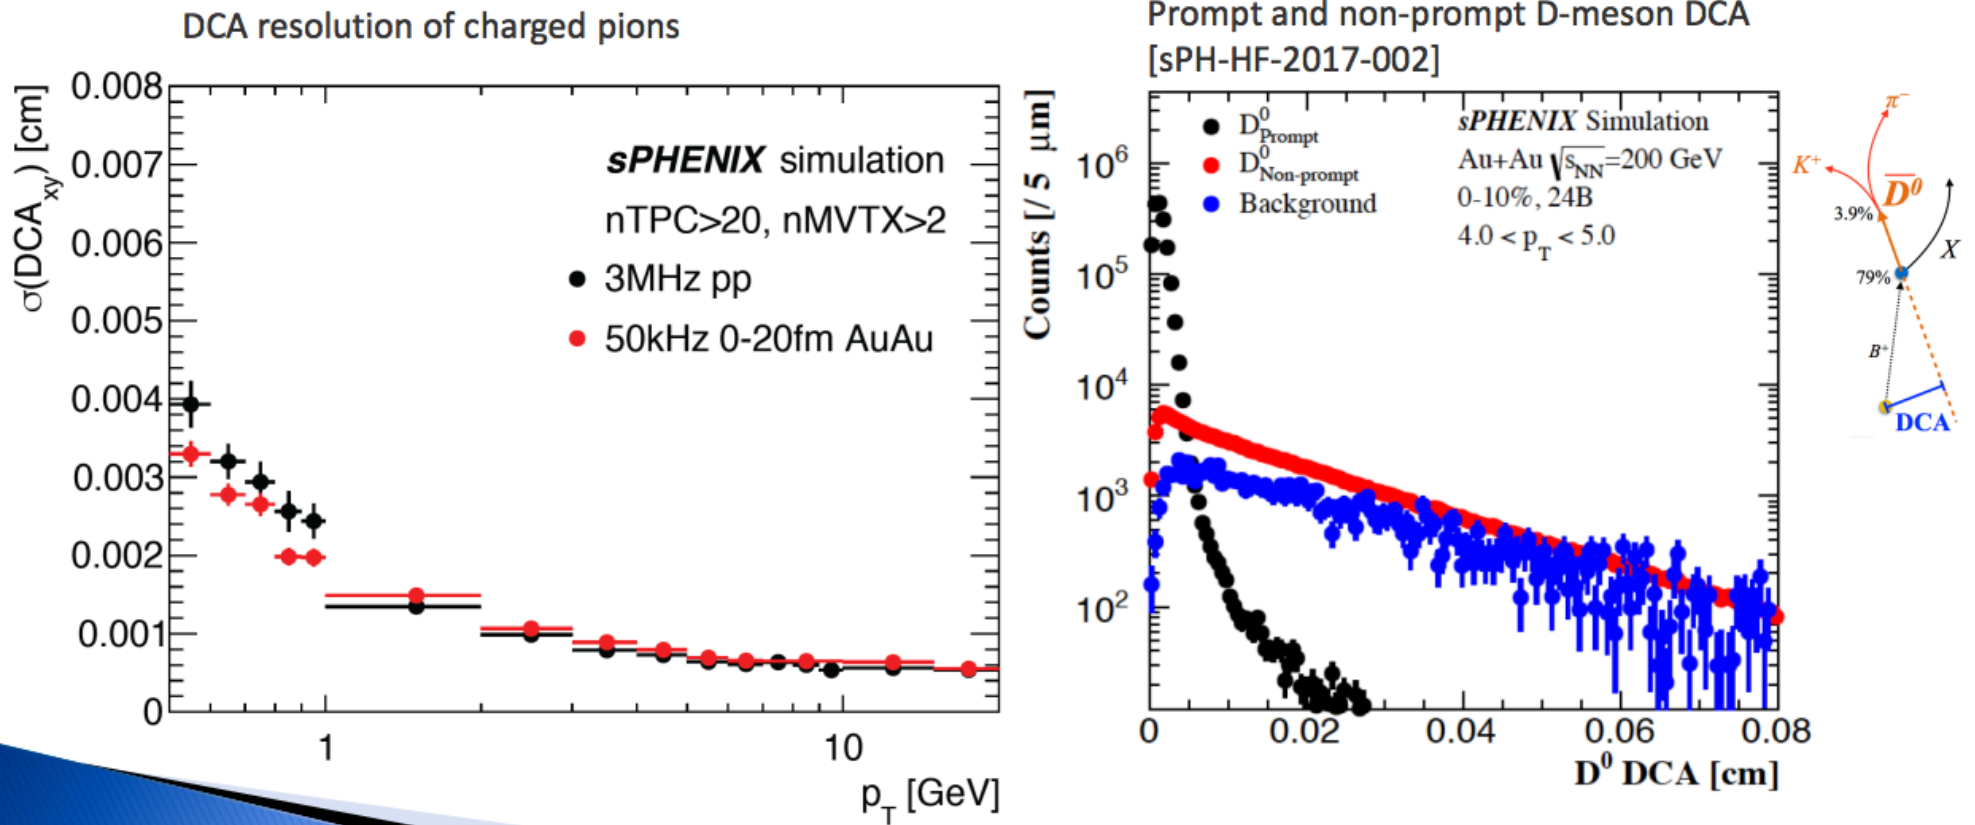

Thank you very much

# sPHENIX

Exceptional performances expected for open heavy flavor

## Cleanly separate open bottom meson via DCA

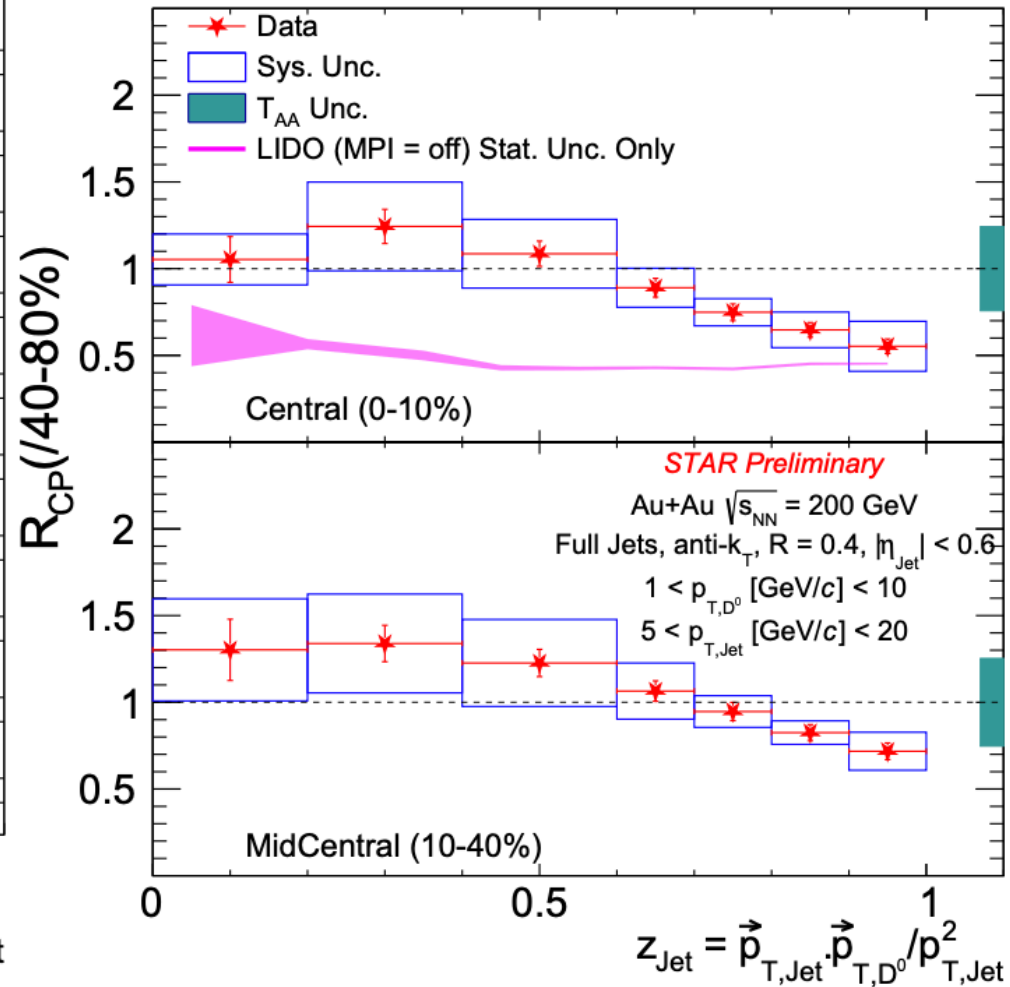

# Outlook

RHIC, BNL: sPHENIX, STAR, (PHENIX data analysis) (2024 pp AuAu), 2025 (AuAu)

# STAR
