New Constraints on Gauged $U(1)_{L_\mu - L_\tau}$ Models via Z-Z' Mixing

Coh Miyao
Kyushu U.

SUSY2024

10th June 2024

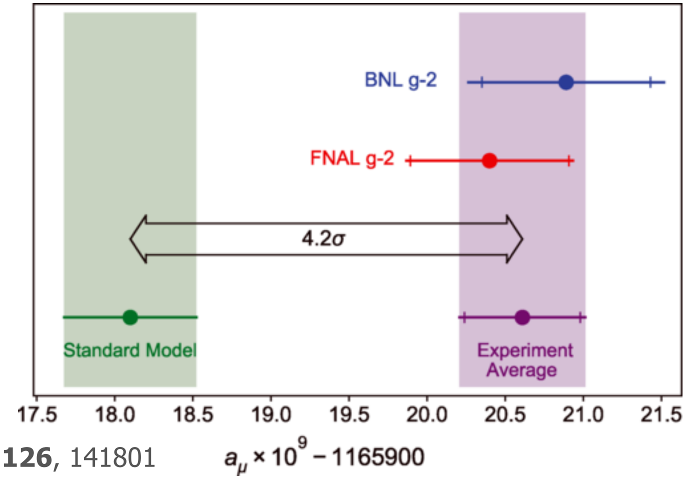
Based on [arXiv : 2401.17613]

working with K. Asai(ICRR), S. Okawa(KEK), and K. Tsumura(Kyushu U.).

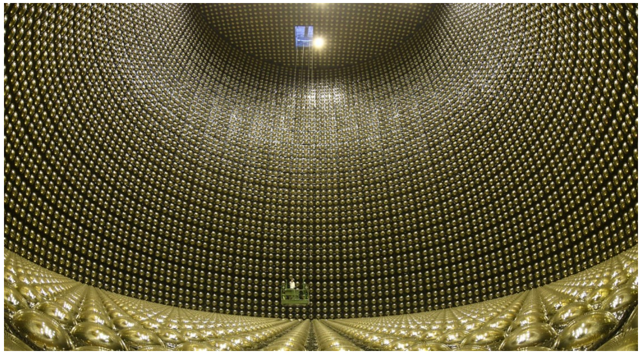
Background

- The discrepancy of muon g-2 between the SM and experimental results.
  → $\mathrm{U}(1)_{L_\mu - L_\tau}$ gauge models can explain.

- The recent experiments of the neutrino oscillation become more precise.
  → Simple $\mathrm{U}(1)_{L_\mu - L_\tau}$ gauge models seem hard to describe the neutrino physics.



Cited from
Phys. Rev. Lett. **126**, 141801



Cited from https://www-sk.icrr.u-tokyo.ac.jp/sk/

Purpose

- To find the $\mathrm{U}(1)_{L_\mu - L_\tau}$ gauge models which are consistent to the latest neutrino experiments.

- To get new (model dependent) constraints on the $\mathrm{U}(1)_{L_\mu - L_\tau}$ gauge models.

Results for Analysis of Neutrino Mass Matrix Structure

- Model independent result set by neutrino mass matrix.
- Each models have their own mass matrix structure.

Our work
(previous work[Phys. Rev. D 99 (2019) 05502])

Model	Normal ordering	Inverted ordering
$\mathrm{SM} + \mathrm{N}_i + \sigma_{+1}$	Viable in 2σ (Viable at 3σ)	Excluded (Excluded)
$\mathrm{SM} + \mathrm{N}_i + \Phi_{+1}$	Excluded (Excluded)	Viable at 3σ (Excluded)
$\mathrm{SM} + \mathrm{N}_i + \Phi_{-1}$	Excluded (Excluded)	Excluded (Excluded)

<u>→ Are there any other constraints on the viable model?</u>

Z-Z' Mixing

- The additional $\mathrm{U}(1)_{L_\mu - L_\tau}$ gauge symmetry induces Z-Z' mixing.

$$\mathcal{L}_{\text{gauge}} = -\frac{1}{4}B_{\mu\nu}B^{\mu\nu} - \frac{1}{4}Z'_{\mu\nu}Z'^{\mu\nu} + \frac{1}{2}\frac{\varepsilon}{\cos\theta_W}B_{\mu\nu}Z'^{\mu\nu}$$

$$\mathcal{L}_{\varepsilon_Z} = \frac{1}{2}\begin{pmatrix} Z_\mu & Z'_\mu \end{pmatrix}\begin{pmatrix} 1 & -\varepsilon_Z \\ -\varepsilon_Z & m_{Z'}^2/m_Z^2 \end{pmatrix}\begin{pmatrix} Z^\mu \\ Z'^\mu \end{pmatrix}$$

$$\varepsilon_Z \equiv \frac{m_{Z'}}{m_Z}\delta$$

$$\mathcal{L} \supset Z'_\mu\left(g_{Z'}J^\mu_{L_\mu - L_\tau} + \varepsilon e J^\mu_{\text{em}} + \varepsilon_Z g_Z J^\mu_{\text{NC}}\right)$$

$\rightarrow$ G_F and $\sin^2\theta_W$ are changed.

(Now we ignore the kinetic mixing $\varepsilon \sim g_{Z'}/70$ which is much smaller than ε_Z in our interest parameter space.)

Atomic Parity Violation (APV)

- The weak charge of Cs is given by the measurements of APV;

$$Q_{\mathrm{W}}^{\mathrm{exp}}({}^{133}_{55}\mathrm{Cs}) = -72.94(43)$$

- The weak charge of Cs based on SM is changed by Z-Z' mixing;

$$Q_W({}^{133}_{55}\mathrm{Cs}) \simeq Q_W^{\mathrm{SM}}({}^{133}_{55}\mathrm{Cs})\left(1+\delta^2\right)$$

$$\longrightarrow \quad |\delta|^2 \lesssim 5.7 \times 10^{-3} \quad \text{(90\% CL)}$$

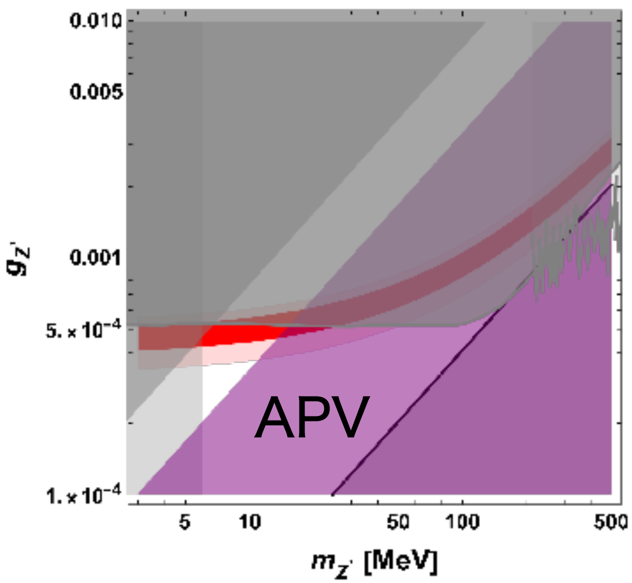
Flavor Changing Meson Decay

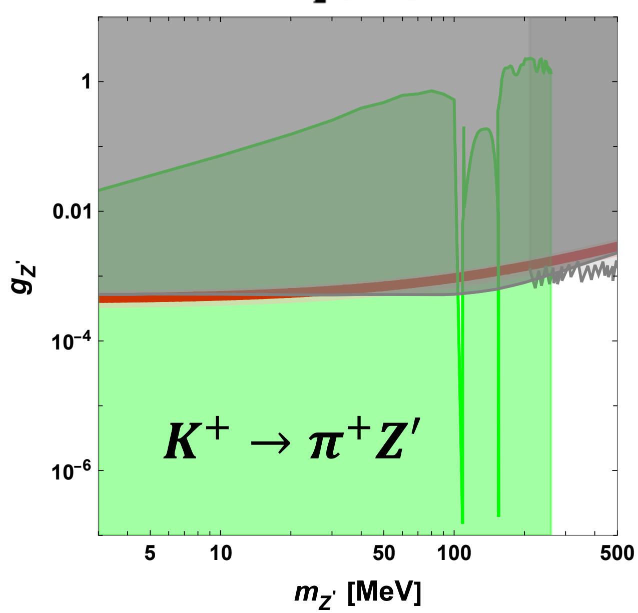
- Flavor changing meson decays provide a good probe of a light Z' boson.
- Branching ratio of $K^+ \to \pi^+ Z'$ is written by;

$$\mathrm{Br}(K^+ \to \pi^+ Z') \simeq 1.6 \times 10^{-4} |\delta|^2$$

$$\longrightarrow \quad |\delta| \lesssim 2.5 \times 10^{-4} \sqrt{\frac{\mathrm{Br}(K^+ \to \pi^+ Z')_{\mathrm{exp}}}{1 \times 10^{-11}}}$$

Constraint on Model with $\boldsymbol{\Phi}_{+1}$





In this model $\delta = \dfrac{1}{v}\dfrac{m_{Z'}}{g_{Z'}}$.

Cs APV :

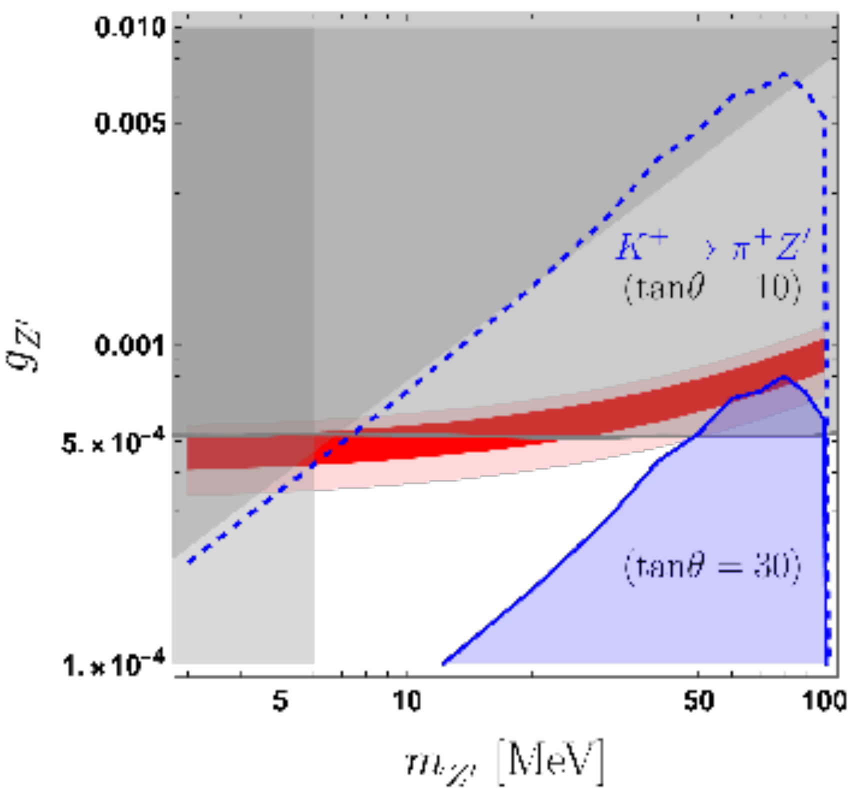
$$g_{Z'} \gtrsim 5.4 \times 10^{-4} \left(\frac{m_{Z'}}{10\,\mathrm{MeV}}\right)$$

$K^+ \to \pi^+ Z'$:

$$g_{Z'} \gtrsim 1.6 \times 10^{-1} \sqrt{\frac{1 \times 10^{-11}}{\mathrm{Br}(K^+ \to \pi^+ Z')_{\mathrm{exp}}}} \left(\frac{m_{Z'}}{10\,\mathrm{MeV}}\right)$$

- The gray shaded region are excluded by the well-known constraints (from BABAR, NA64μ, white dwarf cooling, and effective number of neutrinos).
- The red region gives the proper correction to muon g-2.
- There is no region which gives proper correction to muon g-2.

Constraint on Model with $\boldsymbol{\Phi}_{+1}$ and a SU(2) singlet scalar $\boldsymbol{\sigma}_{+1}$



In this model, $\delta = \dfrac{\text{sign}(Q_\Phi)}{1+\tan^2\theta}\dfrac{1}{v}\dfrac{m_{Z'}}{g_{Z'}}$.

$\tan\theta \equiv \frac{v_\sigma}{v_\Phi}$ ($v_{\Phi(\sigma)}$ means VEV of $\Phi(\sigma)$).

Cs APV : much smaller than the flavor changing meson decay.

$$g_{Z'} \gtrsim \frac{5.4\times10^{-4}}{1+\tan^2\theta}\left(\frac{m_{Z'}}{10\,\text{MeV}}\right)$$

$K^+ \to \pi^+ Z'$:

$$g_{Z'} \gtrsim \frac{1.6\times10^{-1}}{1+\tan^2\theta}\sqrt{\frac{1\times10^{-11}}{\text{Br}(K^+\to\pi^+Z')_{\text{exp}}}}\left(\frac{m_{Z'}}{10\,\text{MeV}}\right)$$

- Model gives proper correction to the muon g-2 discrepancy when $\tan\theta \equiv \frac{v_\sigma}{v_2} \gtrsim 10$.

Conclusion

- We revisited the minimal $\mathrm{U}(1)_{L_\mu - L_\tau}$ gauge model based on the latest NuFITv5.2 data. As the results, the model with SU(2) doublet scalar $\boldsymbol{\Phi}_{+1}$ was viable at 3σ in case of Inverted ordering while the model was excluded in the previous work.
- Considering the constraints from Z-Z' mixing (APV and flavor changing meson decay process), the model with $\boldsymbol{\Phi}_{+1}$ is completely excluded in the region which give the explanation to muon g-2.
- The model with $\boldsymbol{\Phi}$ and $\boldsymbol{\sigma}$ is viable when $\tan\theta \equiv \frac{v_\sigma}{v_2} \gtrsim 10$.

Neutrino Mass Matrix

- In general,

$$\mathcal{M}_{\nu_L} = U_{\mathrm{PMNS}}\, \mathrm{diag}(m_1\ m_2\ m_3)\, U_{\mathrm{PMNS}}^T \equiv \mathcal{M}_{\nu_L}^{\mathrm{gen}}.$$

$$U_{\mathrm{PMNS}} \equiv \begin{pmatrix} V_{11} & V_{12} & V_{13} \\ V_{21} & V_{22} & V_{23} \\ V_{31} & V_{32} & V_{33} \end{pmatrix} \begin{pmatrix} 1 & & \\ & e^{\frac{i\alpha_2}{2}} & \\ & & e^{\frac{i\alpha_3}{2}} \end{pmatrix}.$$

m_i:light neutrino mass α_i:Majorana phase
V_{ij}:matrix component including mixing angles and CP phase

- Through the seesaw mechanism

$$\mathcal{M}_{\nu_L} \simeq -\mathcal{M}_D\, \mathcal{M}_R^{-1} \mathcal{M}_D^T.$$

→ Some equations arise by comparing these.

Two Zero Texture (Minor) Structure Mass Matrix

- Classification of structures;

$$\mathbf{B_3}: \begin{pmatrix} * & 0 & * \\ 0 & 0 & * \\ * & * & * \end{pmatrix}, \mathbf{B_4}: \begin{pmatrix} * & * & 0 \\ * & * & * \\ 0 & * & 0 \end{pmatrix}, \mathbf{C}: \begin{pmatrix} * & * & * \\ * & 0 & * \\ * & * & 0 \end{pmatrix}$$

- Thorough the seesaw mechanism, the neutrino mass matrix (or its inverted one) often has such structure.
  - Two components of $\mathcal{M}_{\nu_L}$ are zero → Two zero texture
  - Two components of $\mathcal{M}_{\nu_L}^{-1}$ are zero → Two zero minor

The mass matrix with such structures give us two equations. → Predictions

Light Neutrino Mass

$$m_3 = \sqrt{\frac{\Delta m_{31}^2}{1 - \frac{1}{|R_3(\theta_{12},\theta_{13},\theta_{23},\delta_{CP})|^2}}}$$

$$m_1 = \sqrt{m_3^2 - \Delta m_{31}^2}$$

$$m_2 = \sqrt{m_1^2 + \Delta m_{21}^2} = \sqrt{m_3^2 + \Delta m_{21}^2 - \Delta m_{31}^2}$$

Neutrino mass in case of NO.

- These masses can be described in terms of θ_{23}.

($\theta_{12}, \theta_{13}, \Delta m_{21}^2$, Δm_{31}^2 are fixed as best fit value of NuFITv5.2)

Analysis of SM+N_i+Φ_{+1} Model

- **B_3 texture** : $\left(\mathcal{M}_{\nu_L}\right)_{[1,2],[2,2]} = 0$

$$\begin{cases} \left(\mathcal{M}_\nu^{\text{gen}}\right)_{12} = m_1 V_{11} V_{21} + m_2 e^{i\alpha_2} V_{12} V_{22} + m_3 e^{i\alpha_3} V_{13} V_{23} = 0 \ \left(= \left(\mathcal{M}_{\nu}\right)_{12}\right). \\ \left(\mathcal{M}_\nu^{\text{gen}}\right)_{22} = m_1 V_{21}^2 + m_2 e^{i\alpha_2} V_{22}^2 + m_3 e^{i\alpha_3} V_{23}^2 = 0 \ \left(= \left(\mathcal{M}_{\nu}\right)_{22}\right). \end{cases}$$

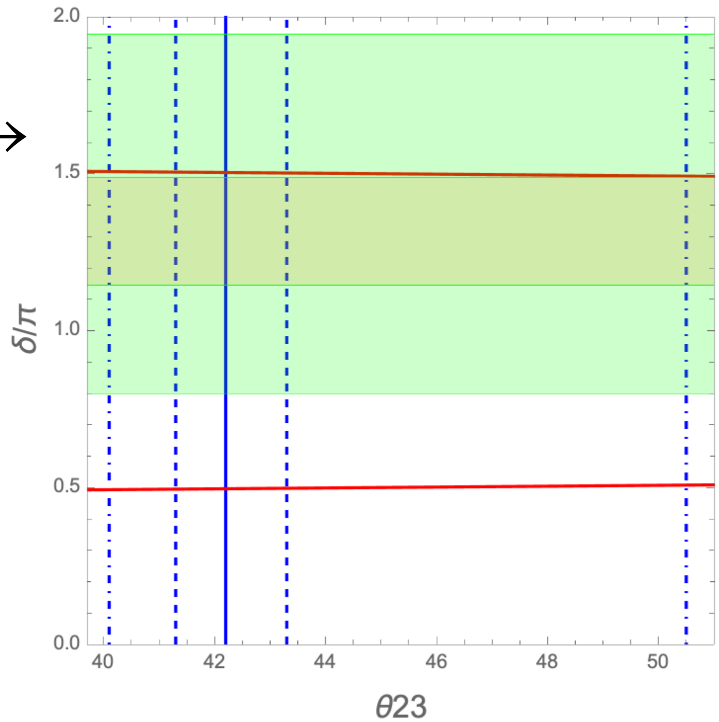
$$\begin{cases} e^{i\alpha_2} \equiv \dfrac{m_1}{m_2} R_2(\theta_{12}, \theta_{13}, \theta_{23}, \delta) \equiv \dfrac{R_2}{|R_2|} \\ e^{i\alpha_3} \equiv \dfrac{m_1}{m_3} R_3(\theta_{12}, \theta_{13}, \theta_{23}, \delta) \equiv \dfrac{R_3}{|R_3|} \end{cases}$$

V_{ij} : components of PMNS matrix , θ_{ij} : mixing angle, δ : CP phase,
α : Majorana phase

- To rewrite mass-squared difference
  in case of **Normal ordering(NO)**

$$\begin{cases} \Delta m_{31}^2 = m_3^2 - m_1^2 = m_1^2(|R_3|^2 - 1) \\ \Delta m_{21}^2 = m_2^2 - m_1^2 = m_1^2(|R_2|^2 - 1) \end{cases}$$

$$(|R_2|^2 - 1) = \frac{\Delta m_{21}^2}{\Delta m_{31}^2}(|R_3|^2 - 1) \quad \rightarrow$$



By fixing $\theta_{12}, \theta_{13}, \Delta m_{21}^2$, Δm_{31}^2 as the best-fit value of NuFITv5.2, θ_{23} -dependence of δ are found.

Neutrino mass and Majorana phase can be written by θ_{23}!

Result of Analysis ($\mathbf{B_3}$ Texture)

- Previous Work
