

Task 7.3: VAriable Dipole for the Elettra Ring (VADER)

3rd I.FAST Annual Meeting - 18/04/24

Y. Papaphilippou for the Task 7.3 collaborators

IFAST

VAriable Dipole for the Elettra Ring - VADER

- Task 7.3 within I.FAST WP7: High Brightness Accelerators for Light Sources
- Partners and collaborators:

Centro de Investigaciones Energéticas, Medioambientales y Tecnológicas

M. Dominguez

F. Toral

E. Karantzoulis

D. Castronovo

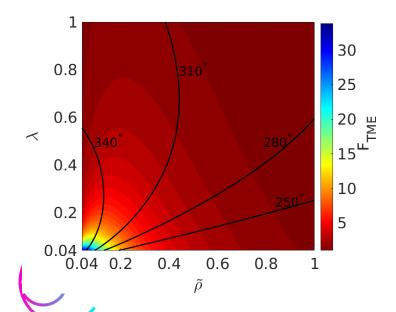

R. Geometrante

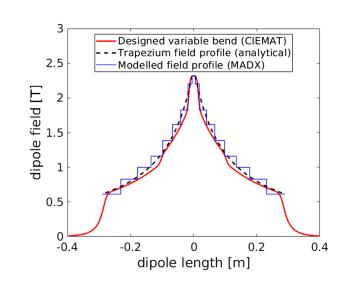

(A. Poyet)

VADER objectives

- Fabricate an innovative dipole magnet prototype with longitudinal varying dipole field, including a transverse gradient for the ELETTRA upgrade
- Permanent magnet concept with trapezoidal bending radius, 2.3 T peak field and ~10 T/m gradient, already established (CERN/CIEMAT)
- Proved the horizontal emittance reduction to ultra-low levels of i.e. ~60 pm @
 2.86 GeV, for the CLIC DR (M. A. Domínguez Martinez et al., IEEE Trans. Appl. Supercond. 28, 1, 2018; S. Papadopoulou et al, PRAB 22, 091601, 2019)
- First demonstrator constructed/qualified by CIEMAT

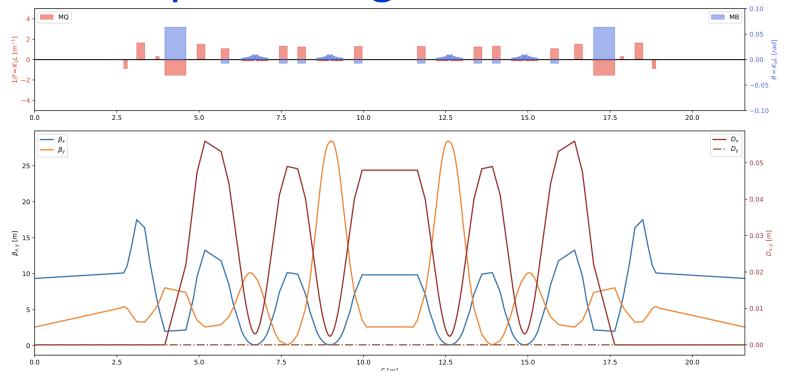

VADER objectives

- Keep the same S6BA-E lattice for Elettra and replace the LG dipoles by VADER ones.
 - Implement a trapezoidal profile in bending radius
 - Observe a clear emittance reduction
- Some constraints:
 - Same geometrical layout
 - Same total bending angle for each dipole
 - Same dipole length
- But also some freedoms:
 - We set the dipole peak field at 2.3 T (as for the CLIC magnet) instead of the current 1.8 T

A. Poyet

Lattice and optics design

Optics constraints at the ID are matched

Tunes: 34.706 / 22.852

 Horizontal emittance reduction from 212 to 100 pm (more than factor of 2!)

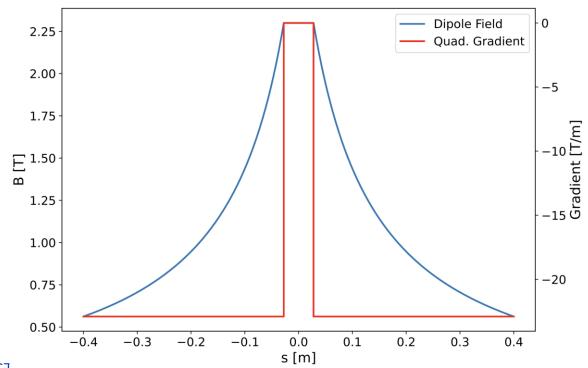

- Chromaticities: -157/-125
- ✓ Non-linear optimization: already good on-momentum DA

Profile Design and Magnet Specifications

- Similar parameters as CLIC DR but...
 - Higher transverse gradient (> factor of 2)
 - Higher magnetic gap (~40%)
 - Longer magnet (~40%)

Specifications	CLIC DR	VADER
Magnet Gap (mm)	13	18
Max Field (T)	2.3	2.3
Transverse G (T/m)	11	23
Field Quality (Units 1E-4)	≈]	≈]
Magnet Length (cm)	56	80

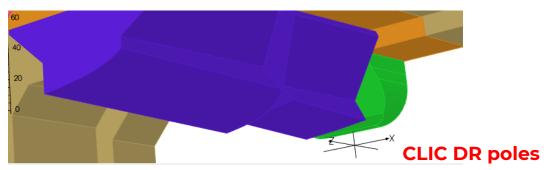

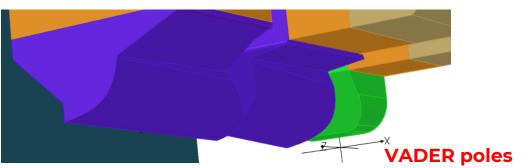

Magnetic Design @ CIEMAT

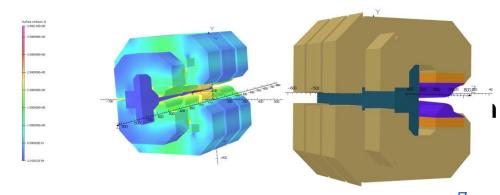

M. Dominguez, F. Toral

No changes in philosophy, major changes in poles (90% of the design time)

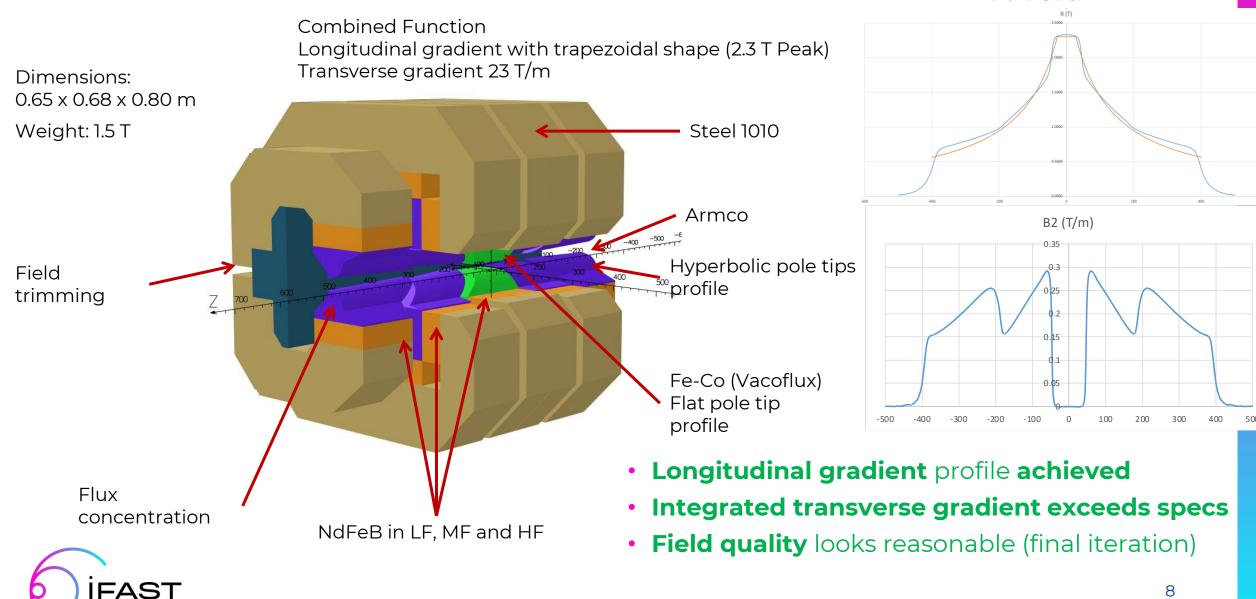

- All NdFeB permanent magnet blocks, including low-field modules
- Permanent magnet volume increased around 40% reaching demanded field peak of 2.3 T with magnet gap of 18mm (17+1mm)
- New field trimming design implemented
 - Yoke completely split in two parts supported by an aluminium block
 - Sliding parts achieve higher/better than CLIC DR prototype

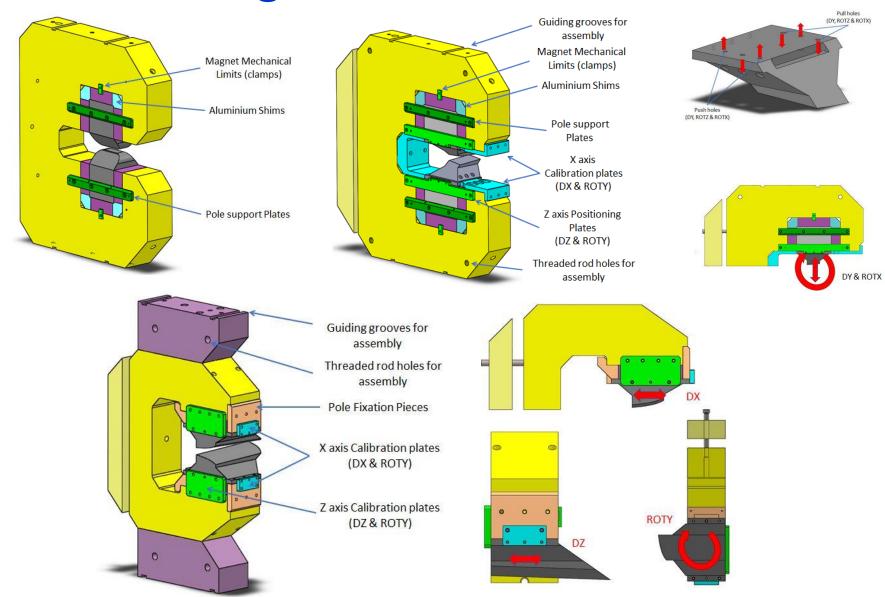

Magnetic Design @ CIEMAT

M. Dominguez, F. Toral

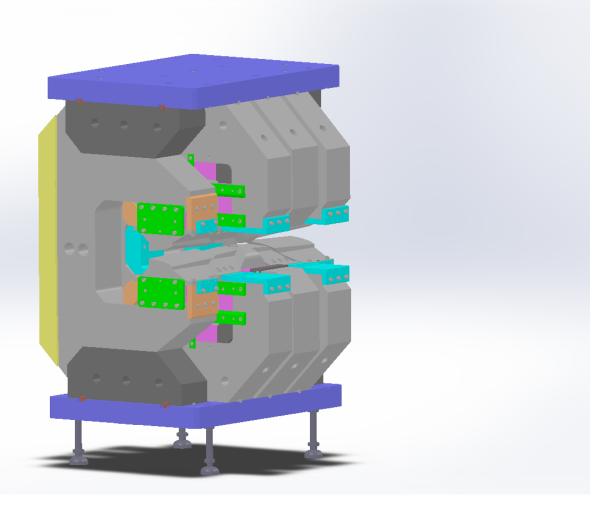

Mechanical Design @ CIEMAT

Mechanical Design @ CIEMAT

Magnet progressing towards its fabrication

VADER timeline

	Deliverable description	Month	
1	Magnet Specifications based on optics calculations for ELETTRA	12	Milestone MS 26
2	Magnetic and mechanical design (including fabrication drawings)	24	
3	Fabrication of the prototype	42	→ Deliverable D7.3
4	Acceptance tests	48	→ Milestone MS 27

- Optics work including magnet specifications completed (CERN/Elettra) since end of 2022 (8 months delay, delay in hiring fellow)
- Magnetic and mechanical design from CIEMAT in final stage with input from KYMA for fabrication, to be ready by April 2024 (11 month delay)
- Fabrication of the prototype by KYMA start on May 2024 ready for acceptance tests by beginning of 2025 (3 months delay)
- Acceptance tests may be delayed beyond M48

Instead of a conclusion...

- SAC feedback on 2nd IFAST annual meeting (2023)
 - Permanent magnets as key technologies to reduce energy consumption
 - Excellent idea of dipole at center and gradient at longitudinal ends
 - Small adjustability may be required in the practical applications,
 - Suggestions:
 - Encourage to achieve the progress in time
 - Struggled from beginning of project with delays on hiring and available personnel resources
 - Accumulated a few months delay
 - Suggest to study/investigate the field adjustability in long term operation
 - New field trimming design implemented for small field adjustments

Next steps

- Transmission of final drawings and fabrication of the prototype
- Implementation of realistic field profile and in Elletra optics model and final nonlinear optimization, including field errors

iFAST Thank you for your attention!

This project has received funding from the European Union's Horizon 2020 Research and Innovation programme under GA No 101004730.
