# Outline

- ► Intro: Standard Model Effective Field Theory
- > Part I: Statistical analysis using SFitter
- > Part II: SFitter analyses with public likelihoods
- Part III: The Global SMEFT analysis
- ► Conclusion

# **Standard Model Effective Field Theory**

#### **SMEFT**

► Well established model agnostic approach in searches for BSM physics

# $\mathcal{L}_{SMEFT} = \mathcal{L}_{S}$

► Up to quadratic order SMEFT contributions included i.e.

$$\sigma = \sigma_{SM} + \frac{c_6}{\Lambda^2}\sigma_6 + \frac{c_6^2}{\Lambda^4}\sigma_{6\times 6} + \frac{c_8}{\Lambda^4}\sigma_8 + \mathcal{O}(\Lambda^5)$$

$$SM + \sum_{d=5}^{n} \frac{C_{i}^{(d)}}{\Lambda^{d-4}} O_{i}^{(d)}$$

# **Standard Model Effective Field Theory**

### **SMEFT**

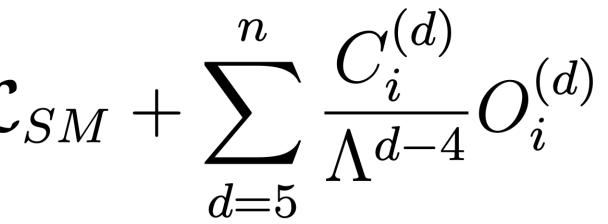

► Well established model agnostic approach in searches for BSM physics

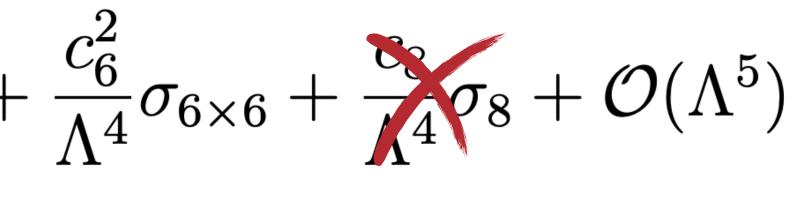

$$\mathcal{L}_{SMEFT} = \mathcal{L}$$

► Up to quadratic order SMEFT contributions included i.e.

$$\sigma = \sigma_{SM} + \frac{c_6}{\Lambda^2}\sigma_6 + \frac{c_6}{\Lambda$$

Restrict ourselves to operators of dimension 6

# **Standard Model Effective Field Theory**

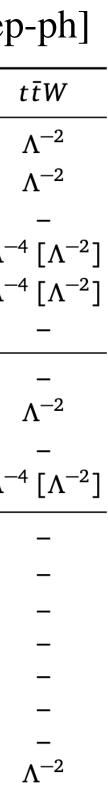

### Updated dataset

Update of <u>arXiv:1910.03606</u> [hep-ph]
 (SFitter global Top fit, 2019)

- ► Impose  $U(2)_q \times U(2)_u \times U(2)_d$  symmetry
  - Consider a total of 22 Operators
- > Includes  $t\bar{t}$ ,  $t\bar{t}Z$ ,  $t\bar{t}W$  and single top data
  - ► Total of 122 datapoints

#### <u>arXiv:2312.12502</u> [hep-ph]

# What is our tool of choice?

### SFitter

- Used for various global SMEFT analyses (Higgs, Di-Boson, EWPO, Top)
- Comprehensive treatment of uncertainties
- Fully correlated systematic uncertainties within experiments
- > Allows for both profiling and marginalization methods
- > Mapping of likelihood using MCMC

Goal of this part: Explain what exactly all this means

### The exclusive likelihood

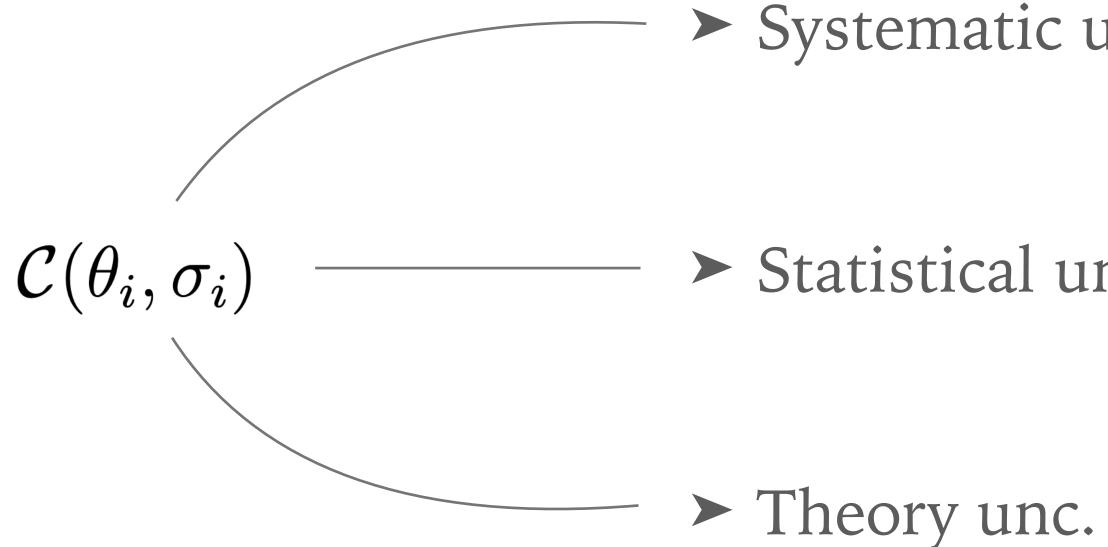

Likelihood for a single measurements modelled as

$$\mathcal{L}_{excl} = \operatorname{Pois}(d|p(\alpha_n, \theta_i, b)) \operatorname{Pois}(b_{CR}|b\,k) \prod_i \mathcal{C}(\theta_i, \sigma_i)$$

- $\blacktriangleright$  SMEFT contributions are incorporated into model parameters  $\alpha_n$
- > Uncertainties included via nuisance parameters (NP)  $\theta_i$
- $\blacktriangleright$  Constraint term  $C(\theta_i, \sigma_i)$  depends on uncertainty considered

#### Uncertainty constraints

Choice of constraint is motivated by physical intuition

However: They are a choice and could technically be chosen differently

**inc.** 
$$\mathcal{N}(x|\mu,\sigma) = \frac{1}{\sqrt{2\pi\sigma}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right)$$

**nc.** 
$$\operatorname{Pois}(n|\nu) = \frac{\nu^n e^{-\nu}}{n!}, \quad \nu > 0$$

$$\mathcal{F}(x|\mu,\sigma) = \frac{1}{2\sigma}\Theta\left[x - (\mu - \sigma)\right]\Theta\left[(\mu + \sigma) - x\right]$$

### Generalization to multiple measurements

Global analyses study numerous different processes

$$\mathcal{L}_{\text{excl,full}} = \prod_{c} \text{Pois}(d_c | p_c) \text{Pois}(b_{CR_c} | b_c \, k_c) \prod_{i} \mathcal{C}(\theta_{i,c}, \sigma_{i,c})$$

- ► Take into consideration correlations between these measurements  $\mathcal{N}( heta_{syst,i}|0,\sigma_i)$  -
- Assumption: Systematics are fully correlated between measurements

$$\longrightarrow \mathcal{N}(\vec{\theta}_{syst,i}|\vec{0}, \Sigma_i)$$

### Systematic uncertainties

- Each category of systematic is fully correlated within CMS and ATLAS
- Luminosity correlated between both experiments

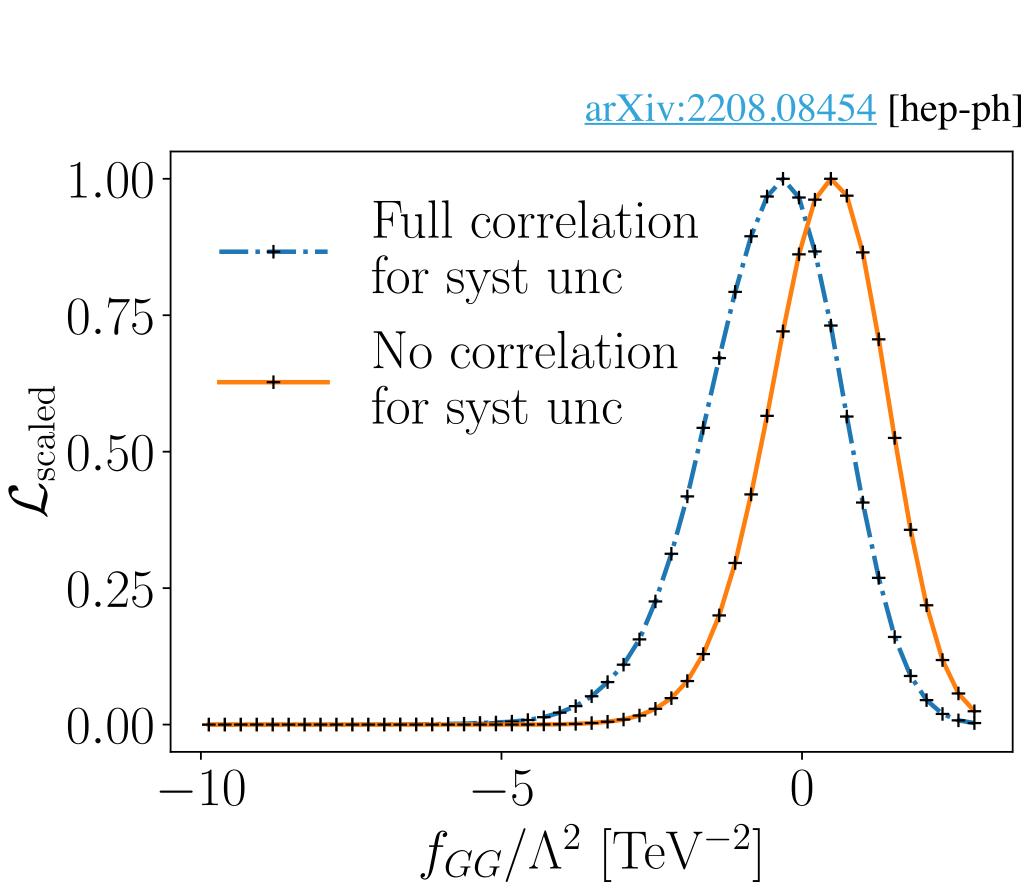

Systematic uncertainties

Beam Background (Separate for each channel) ETmis Jets Leptons LightTagging Luminosity Pileup Trigger Tune bTagging partonShower tTagging tauTagging

### Systematic uncertainties

- Each category of systematic is fully correlated within CMS and ATLAS
- Luminosity correlated between both experiments
- Clear shift in the likelihoods due to correlations between systematics

### To profile or to marginalize

Common exclusive likelihood constructed

$$\mathcal{L}_{excl} = \operatorname{Pois}(d|p(\alpha_n, \theta_i))$$

> The nuisance parameters  $\theta_i$  are not physically interesting

# (b, b))Pois $(b_{CR}|b\,k) \prod C(\theta_i, \sigma_i)$

### To profile or to marginalize

Common exclusive likelihood constructed

$$\mathcal{L}_{excl} = \operatorname{Pois}(d|p(\alpha_n, \theta_i))$$

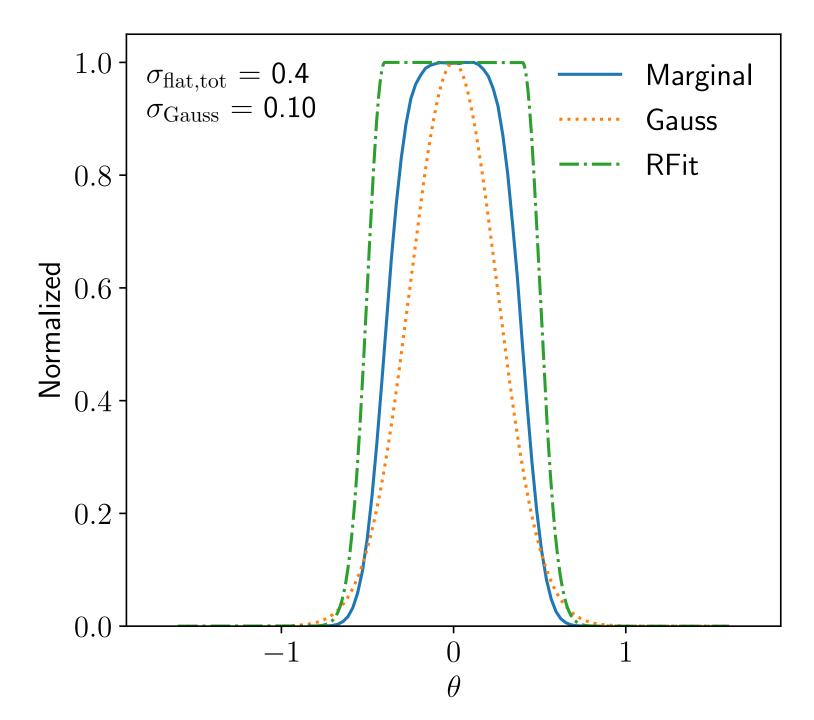

> The nuisance parameters  $\theta_i$  are not physically interesting > **Decision:** How do we handle the nuisance parameters? **Profiling:**  $\mathcal{L}_{\text{prof}}(\alpha) = \max \mathcal{L}_{\text{excl}}(\alpha, \theta)$  $\theta$ 

# (b, b))Pois $(b_{CR}|b\,k)$ $\mathcal{C}(\theta_i, \sigma_i)$

Marginalization:

 $\mathcal{L}_{marg}(\alpha) = \int d\theta \mathcal{L}_{excl}(\alpha, \theta)$ 

### To profile or to marginalize

Comparison for the product of Gaussian and uniform distributions

Marginalization over multiple flat unc. gives Gaussian results

## Takeaway

- Uncertainty treatment essential to our SFitter analysis
  - ► Implementation of theory, statistical and systematic uncertainties
  - Furthermore: Correlated systematics of the same type

- Theory prediction and uncertainties done by us
  - However: The systematics have to be provided by experiment
  - ► How is this data provided and how can we use it?

### Quick overview

Likelihoods published in the HistFactory format

 $c \in \text{channels } b \in \text{bins}$ 

Description	Modification	Constraint $\mathcal{C}$
Luminosity ('lumi')	$\kappa_{sb} = \lambda$	$\mathcal{N}(l = \lambda_0   \lambda, \sigma_\lambda)$
Normalization unc. ('normsys')	$\kappa_{sb} = g_p(\alpha   \kappa_{sb,\alpha=\pm 1})$	$\mathcal{N}(a=0 \alpha,\sigma=1)$
Correlated Shape ('histosys')	$\Delta_{sb} = f_p(\alpha   \Delta_{sb,\alpha=\pm 1})$	$\mathcal{N}(a=0 \alpha,\sigma=1)$
MC Stat. ('staterror')	$\kappa_{sb} = \gamma_b$	$\prod_{b} \mathcal{N}(a_{\gamma_{b}} = 1   \gamma_{b}, \delta_{b})$
Uncorrelated Shape ('shapesys')	$\kappa_{sb} = \gamma_b$	$\prod_{b} \operatorname{Pois}(\sigma_{b}^{-2}   \sigma_{b}^{-2} \gamma_{b})$
Normalization ('normfactor')	$\kappa_{sb} = \mu_b$	

# $\chi \in \vec{\chi}$ ► Provides effect of individual NPs via $\nu_{cb} = \sum_{s \in \text{samples}} \left( \prod_{\kappa \in \vec{\kappa}} \kappa_{scb} \right) \left( \nu_{scb}^0 + \sum_{\Lambda \subset \vec{\Lambda}} \Delta_{scb} \right)$

### Quick overview

- Likelihoods published in the HistFactory format  $\mathcal{L}(n_{cb}, a_{\chi}|\eta, \chi) =$  $c \in \text{channels } b \in \text{bins}$
- > There are many different nuisance parameters (hundreds)
- > Analysed using dedicated python libraries such as **pyhf** and **cabinetry** 
  - Question: How to make use of this in SFitter analyses?

Pois
$$(n_{cb}|\nu_{cb}(\eta,\chi))\prod_{\chi\in\vec{\chi}}\mathcal{C}_{\chi}(a_{\chi}|\chi)$$

### Uncertainties

- Previously: Uncertainties taken as given in the paper
- ► **Now:** Uncertainties extracted from profiling fit via pyhf
  - Implemented into SFitter using the constraints terms  $C(\theta_i, \sigma_i)$
- **Problem:** Difficult to automate due to inconsistent naming conventions

► Now: Simply separate the nuisance parameters in profile likelihood fit

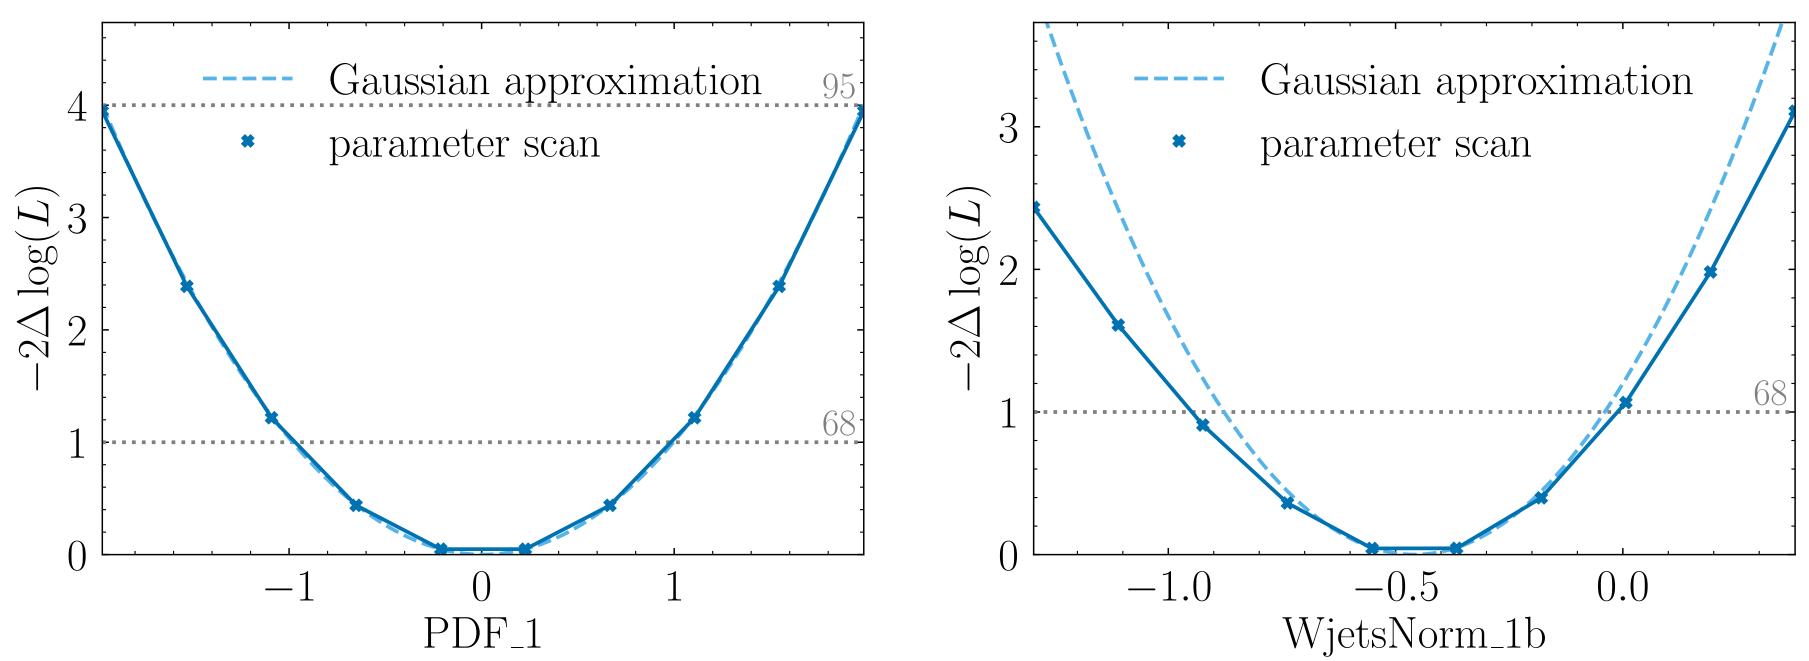

## **Testing Implementation**

- ► Low dimensional fit to only  $C_{tG}$  and total cross section measurements
- Neglect theory uncertainties
- Excellent agreement between both methods of implementation

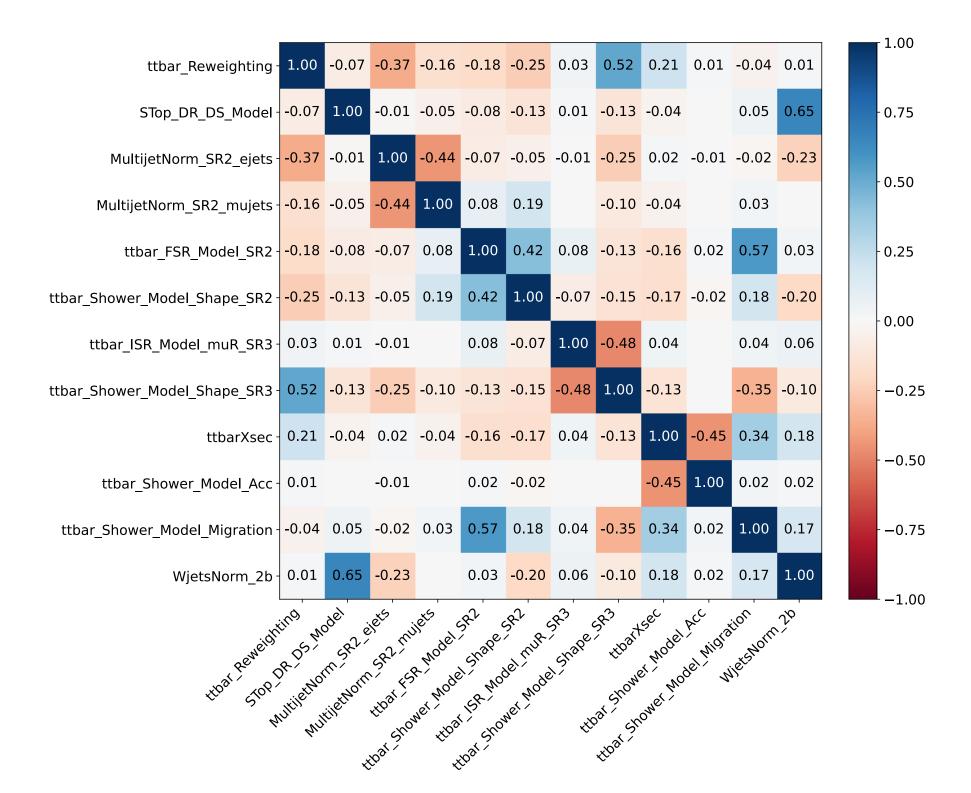

# Parameter scans with **Ecabinetry**

NPs are all very Gaussian, only small number of exceptions
 Validates Gaussian constraint term C(θ<sub>i</sub>, σ<sub>i</sub>) for systematics

#### arXiv:2312.12502 [hep-ph]

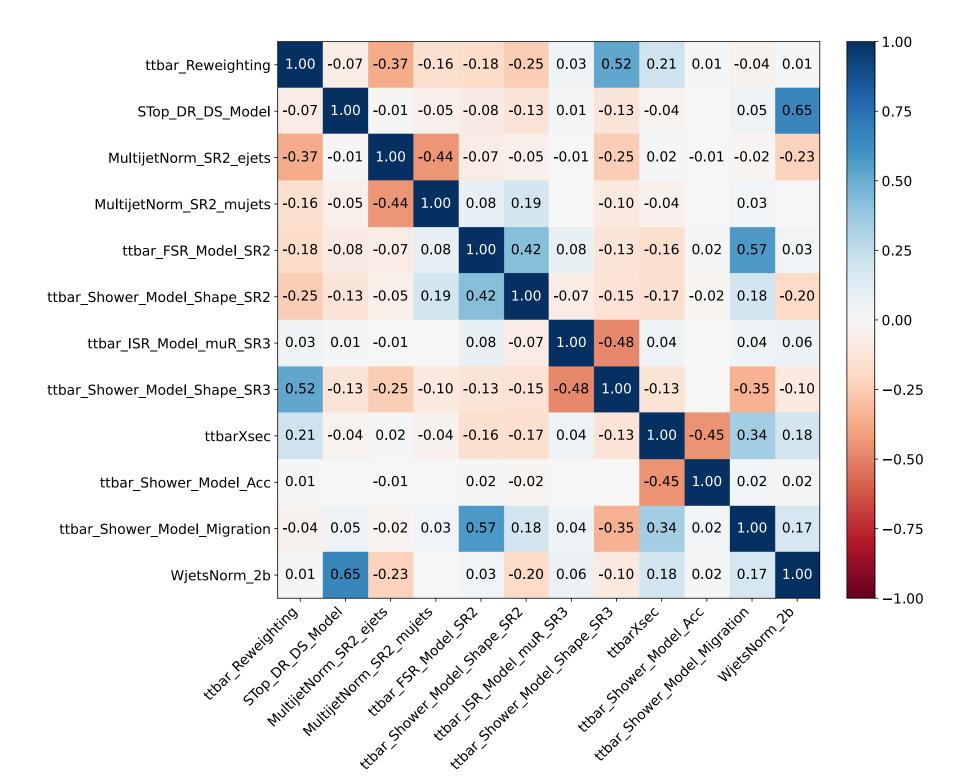

#### **Concerning Correlations**

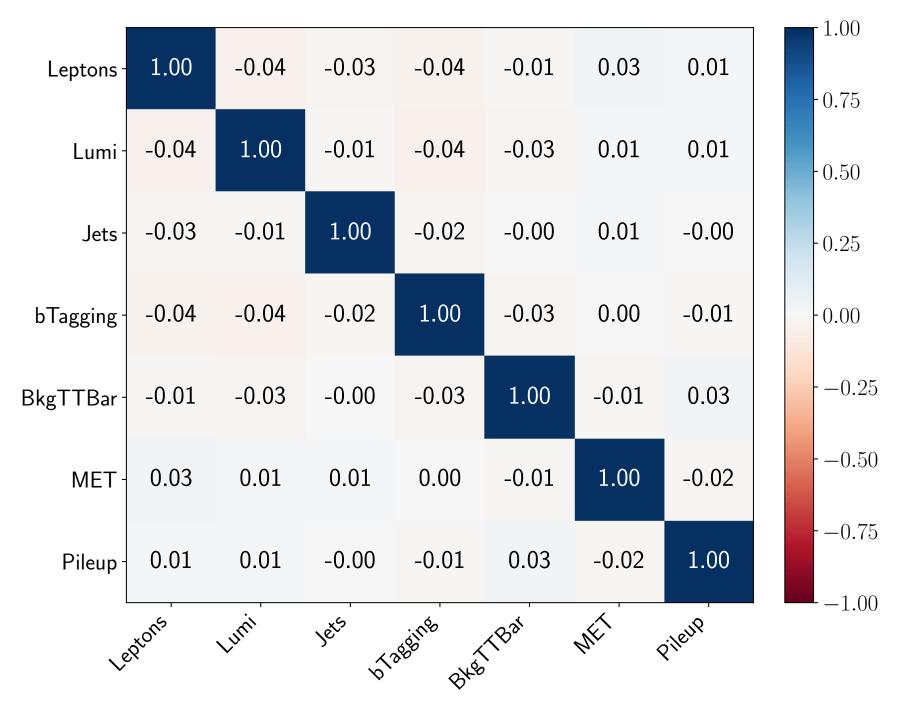

#### Currently: No correlations between uncertainties within a measurement

#### **Concerning Correlations**

Currently: No correlations between uncertainties within a measurement
 Correlations of systematics included in SFitter are negligibly small

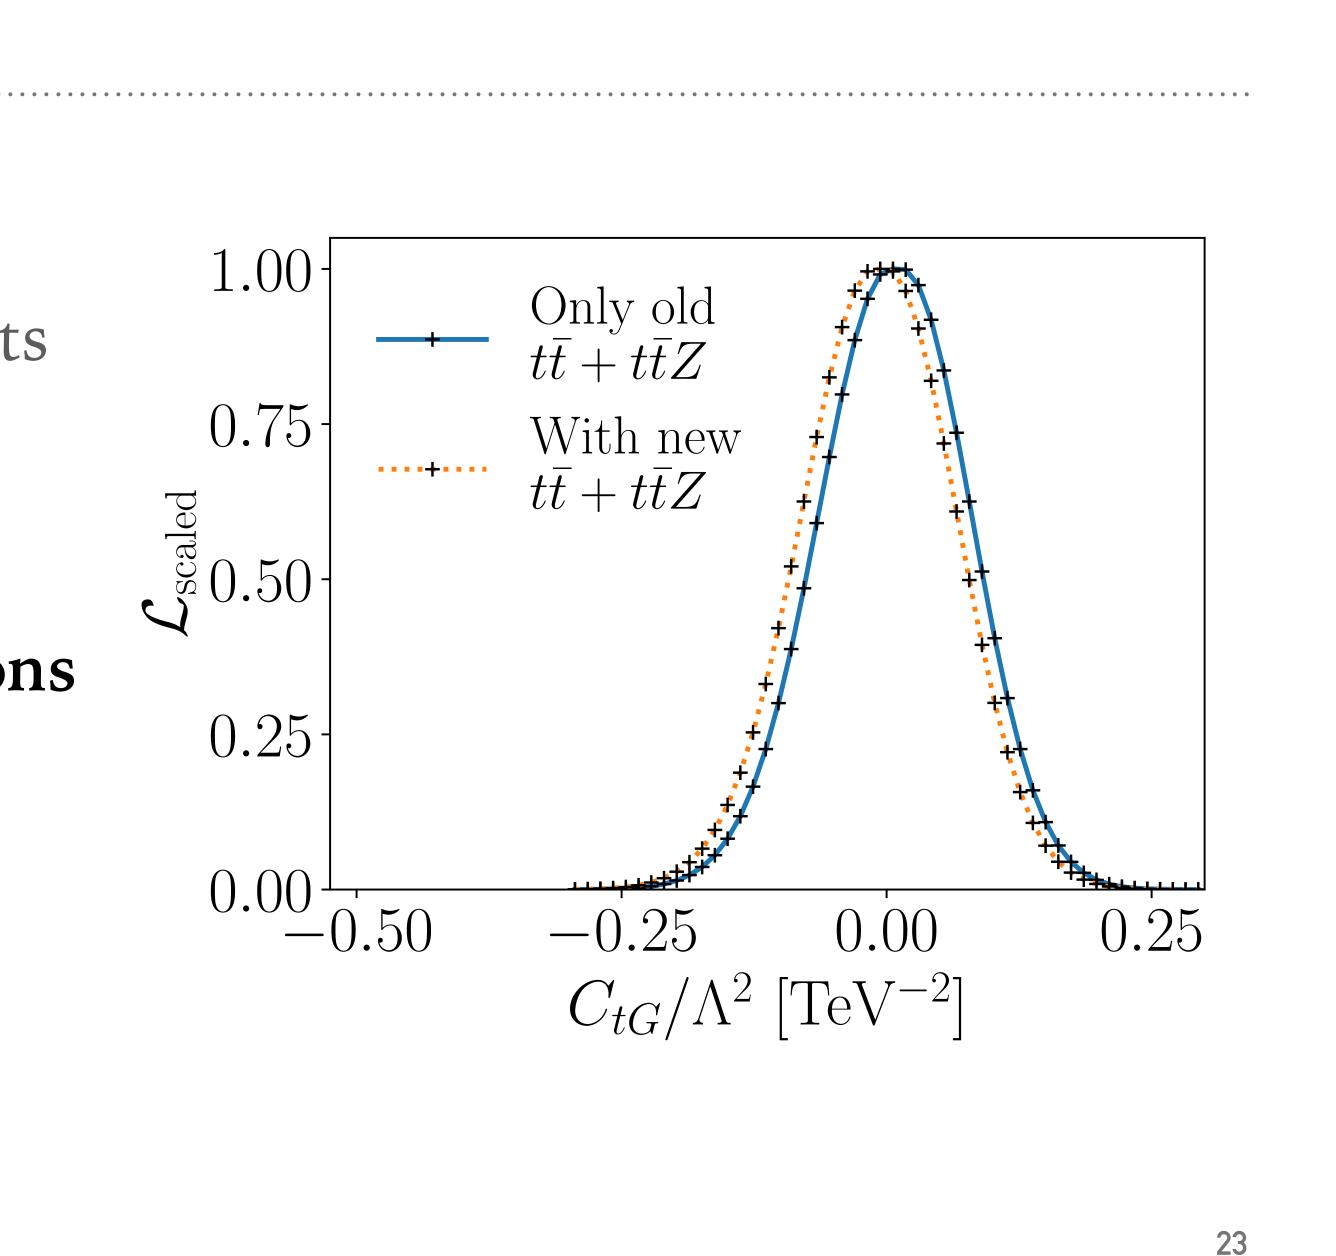

#### arXiv:2312.12502 hep-ph]

### Constraints

- Visible shift from new measurements
- Constraints shift slightly after including both new measurements
- Measurements of total cross sections barely affect constraints

### Results (New dataset)

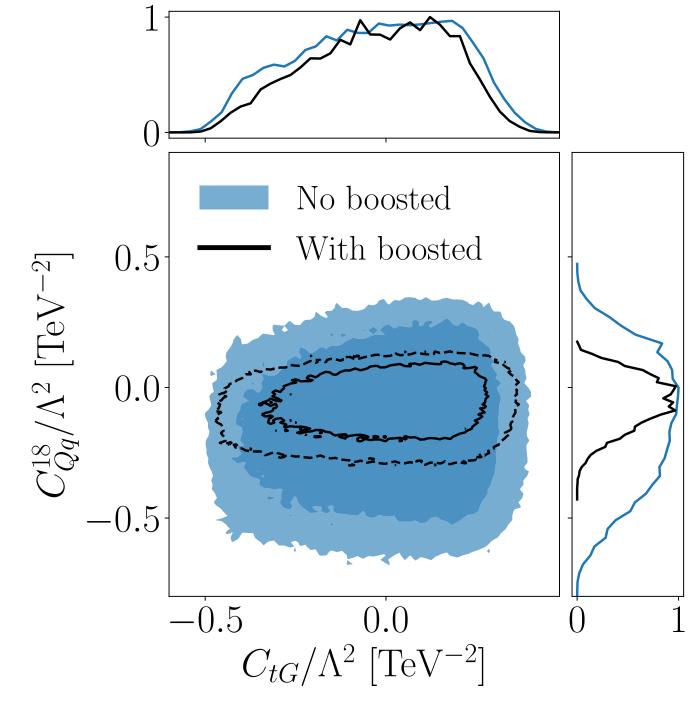

- Shown operators are all constrained by one of the public likelihoods
- Visibly stronger constraints, especially for four-fermion operators
- However: Constraints barely affected by measurements with likelihoods

<u>arXiv:2312.12502</u> [hep-ph] Old dataset New dataset  $C_{tq}^8/\Lambda^2 \left[ {
m TeV}^{-2} 
ight]$  $\mathcal{I}_{Qq}^{31}/\Lambda^2~[{
m TeV}^{-2}]$ 0.0 -0.2-0.4 $0.5 \ 0$ -0.50.0  $C_{Qu}^1/\Lambda^2 \; [{\rm TeV}^{-2}]$  $C_{\phi Q}^3 / \Lambda^2 \, [\text{TeV}^{-2}]$ 20 $/\Lambda^2 \left[ TeV^{-2} \right]$  $C^-_{\phi Q \prime}$ -200  $\left( \right)$  $C_{\phi t}/\Lambda^2 \; [{\rm TeV}^{-2}]$ 

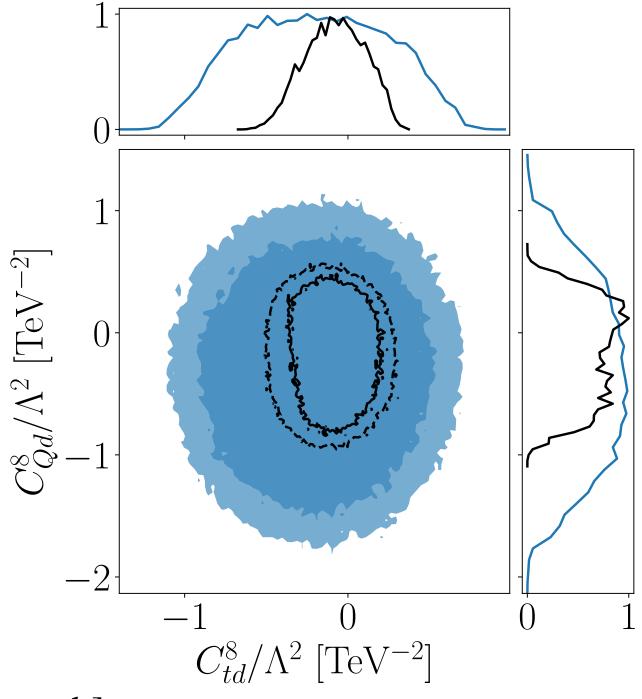

#### Results (Boosted measurement)

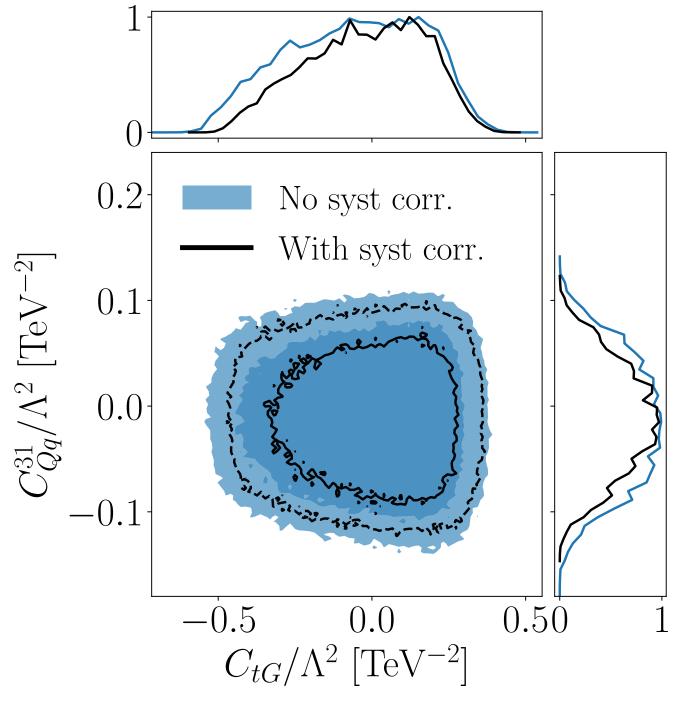

Boosted measurement strongly affect constraints for four-fermion operators 

arXiv:2312.12502 [hep-ph]

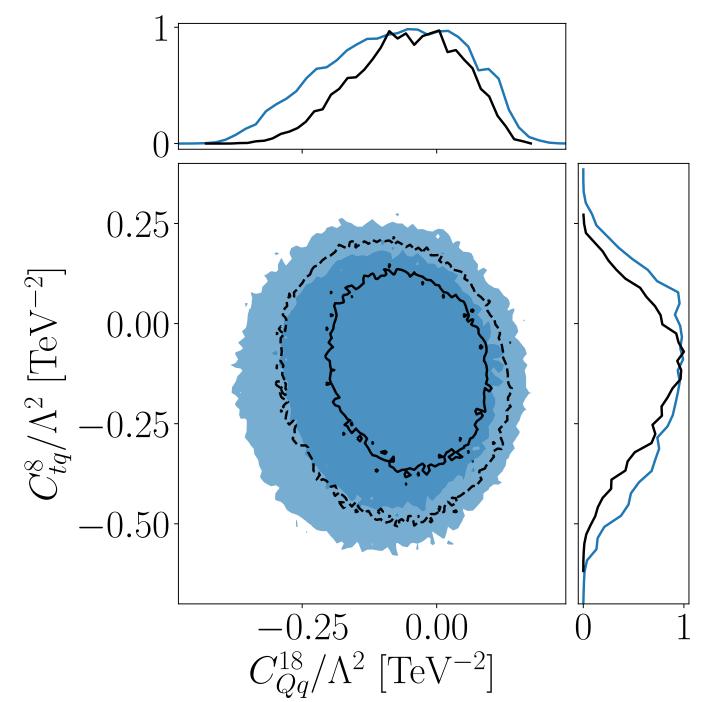

#### Results (Correlations)

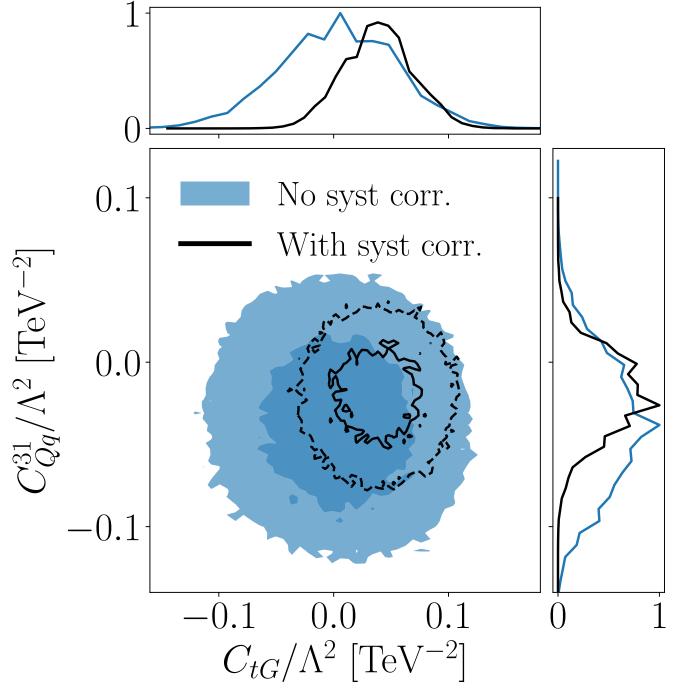

### Correlations lead to slightly stronger constraints

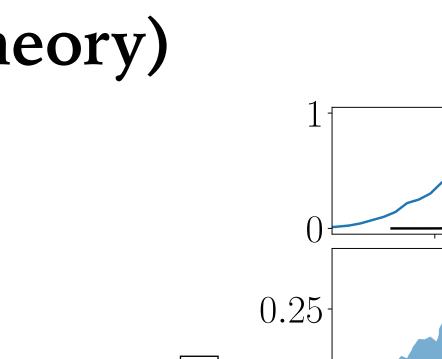

arXiv:2312.12502 [hep-ph]

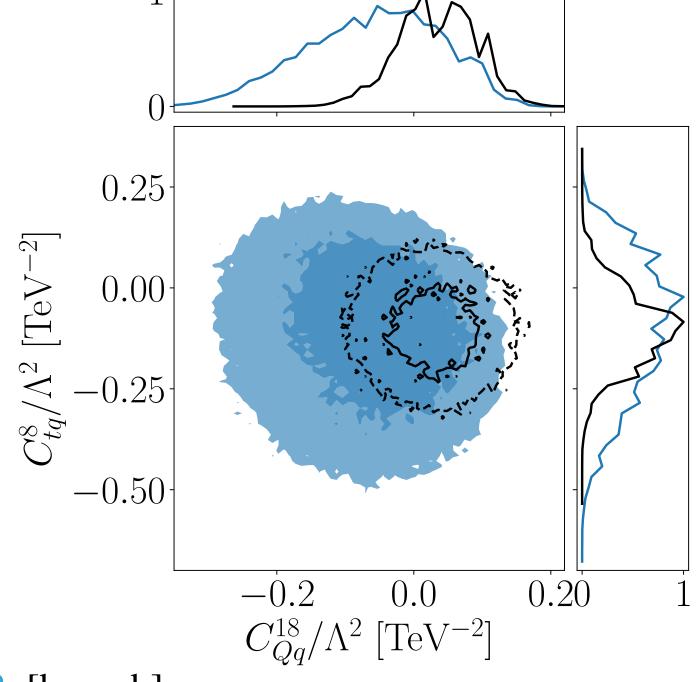

#### Results (Correlations, neglecting theory)

arXiv:2312.12502 [hep-ph]

Correlations lead to significantly different results also in the Top sector

# Concluding

- - Large effect of theory uncertainties in the top sector
  - Published likelihoods provide an alternative way to use experimental data > Validates assumptions made in previous analyses

- However: Currently included likelihoods not particularly SMEFT sensitive
  - > Publication of more differential measurements would be useful
  - Global SMEFT analysis requires data from all kinds of processes

**Summary:** Uncertainties and correlations are essential to SFitter constraints
