

## The ultra low mass cooling system of the Belle II DEPFET detector

*Tuesday, 4 September 2012 15:20 (1 hour)*

The new  $e^+e^-$  colliders impose unprecedented demands to the performance of the vertex detectors. To achieve the required resolution in the vertex reconstruction, besides highly segmented pixel detectors, the material budget has to be kept at very low levels to reduce the multiple Coulomb scattering. These requirements are even more challenging in the case of the new Japanese Super Flavour Factory (SuperKEKB) where the very low momentum of the particles in the final state requires a vertex detector with less than  $0.2\%X_0$  per layer, together with  $50 \times 50 \mu\text{m}^2$  pixels, to achieve the aimed resolution of  $8.5 \mu\text{m}$ .

As a consequence, there is an obvious impact on the cooling system, that has to be carefully designed, not allowing active cooling pipes inside the acceptance region. Due to the low power dissipation of the DEPFET sensor and the special geometry of the detectors (with the front end electronics placed at both ends of the ladder), the system can be cooled by circulating cold  $\text{CO}_2$  through the massive support structures outside of the acceptance, while the sensitive area relies on forced convection with cold dry air.

In the talk not only full thermal simulations will be presented but also measurements done with a real mock up, showing that a proper cooling of the vertex detector can be made using this approach.

**Primary author:** Dr MARINAS PARDO, Carlos (Bonn University)

**Co-authors:** OYANGUREN, Arantza (IFIC - Valencia); LACASTA LLACER, Carlos (Universidad de Valencia (ES)); NIEBUHR, Carsten (Deutsches Elektronen-Synchrotron (DE)); KIESLING, Christian; SIMONIS, HJ (Inst. fuer Experimentelle Kernphys. - Universitaet Karlsruhe); ACKERMANN, Karlheinz (Unknown); GADOW, Karsten (Deutsches Elektronen-Synchrotron (DESY)); Dr VOS, Marcel (Universidad de Valencia (ES)); RITTER, Martin (Werner-Heisenberg-Institut); BROVCHENKO, Oksana (KIT); RUIZ VALLS, Pablo (University of Valencia); VOLKENBORN, Robert (Deutsches Elektronen-Synchrotron); HEINDL, Stefan (KIT - Karlsruhe Institute of Technology (DE)); WEILER, Thomas (KIT - Karlsruhe Institute of Technology (DE)); BARVICH, Tobias (KIT - Karlsruhe Institute of Technology (DE))

**Presenter:** Dr MARINAS PARDO, Carlos (Bonn University)

**Session Classification:** Poster session

**Track Classification:** Ultra light mechanics and cooling
