DECTRIS®

detecting the future

DECTRIS *Lunchtime Seminar at SRI 2012*

Lyon Convention Center, Room Rhône 3
Wednesday, July 11, 13:30 – 15:00

**Come and see our latest developments
in Hybrid Pixel Technology!**

Outline

1. Motivation

2. DECTRIS instant retrigger technology

3. PILATUS3 ASIC

4. PILATUS3 X-ray detector series

5. Count-rate considerations

6. Conclusions

PILATUS X-Ray Detectors: Conventional Single-Photon Counting

Signal waveforms illustrating paralyzable counting.

- ***counting of single-photon pulses***
- ***pile-up of simultaneously generated pulses***
- ***counting loss due to pulse pile-up***
- ***paralyzable counting at high photon fluxes***

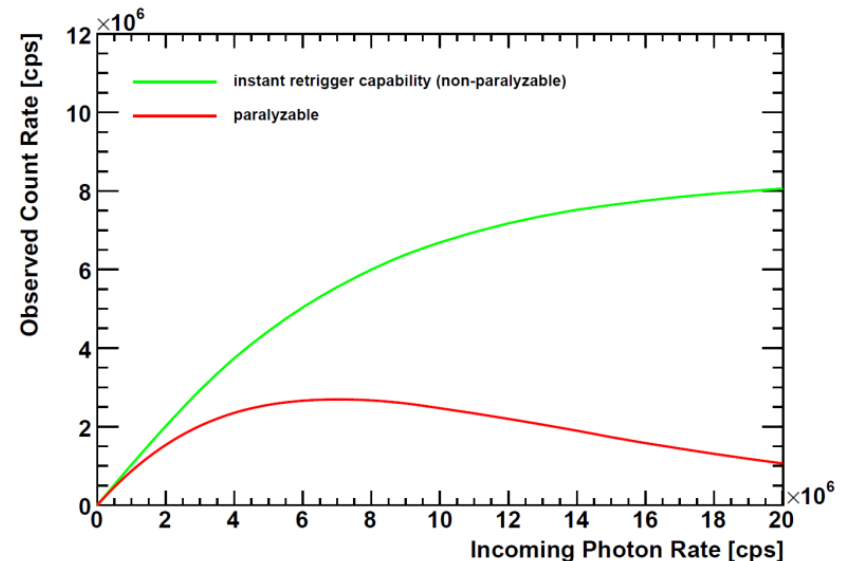

PILATUS X-Ray Detectors: Count Rate Correction Limitations

- **count rate correction in order to compensate for the counting loss at high count rates**
- **correction limitations:**
 - sensitivity (slope) ①
 - ambiguity ②
 - maximum usable rate typically 2×10^6 photons per second and pixel (PILATUS2) ③
- **solution:**
 - instant retrigger technology (patent pending)

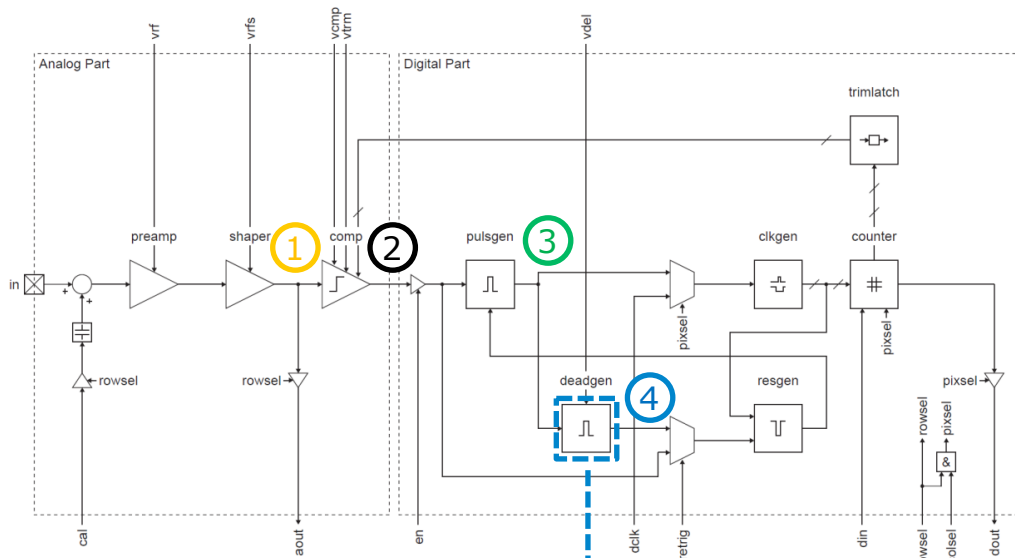

Typical count rate characteristics (measured count rate versus incoming photon rate) of PILATUS2 X-ray detectors. (Synchrotron source, bunch interval 180 ns, photon energy 16 keV, mid gain, threshold energy 8 keV)

Instant Retrigger Technology: Principle

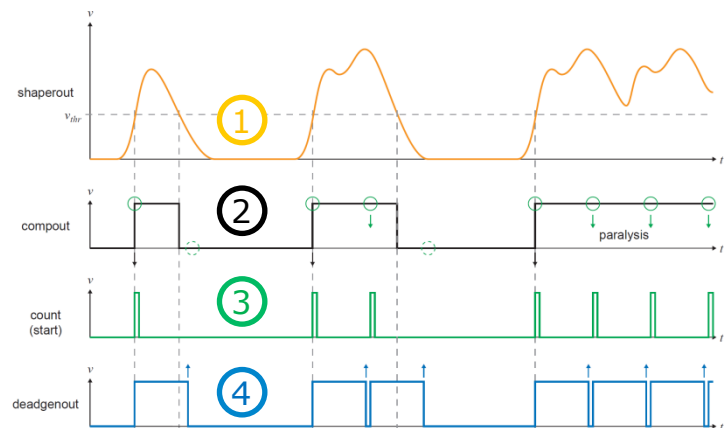

- ***pulse signal re-evaluation after a predetermined dead time interval after each count and potential retriggering of the counting circuit in case of pulse pile-up***
- ***adjustable dead time accounts for the width of a single photon pulse***
 - ***non-paralyzable counting***
 - ***improved high-rate counting performance***
 - ***enhanced count rate correction***

Improved Readout ASIC: Design

Block diagram of the pixel.

Signal waveforms illustrating instant retrigger technology.

Simplified schematic of the dead time generator.

PILATUS3 ASIC: Features

- ***instant retrigger technology with adjustable dead time***
- ***improved high-rate counting performance:***
 - **non-paralyzable counting**
 - **counter overflow handling**
 - **higher local count rates**
 - **enhanced count rate correction**
 - **improved pixel uniformity**
 - **reduced crosstalk**
 - **higher global count rates**
- ***reduced readout time (150 MHz)***
 - ***increased frame rates***
- ***compatibility with CdTe sensors***
 - ***energy range extension for high energy applications***
- ***compatibility with PILATUS2 ASIC***

Photograph of a detail of the PILATUS2 readout ASIC.

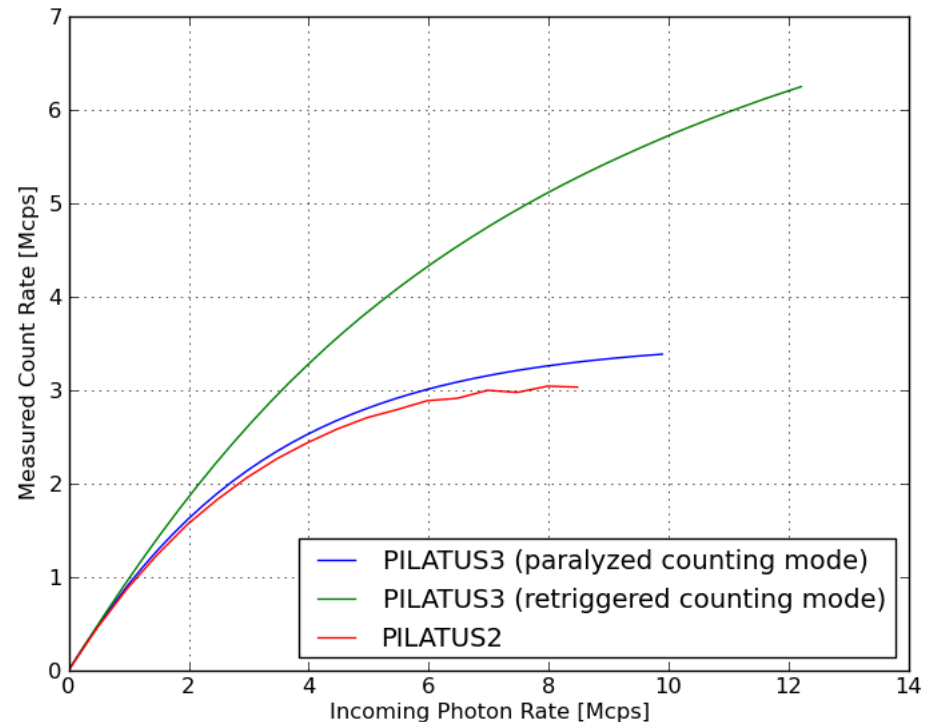

Improved Readout ASIC: Implementation

- **UMC 0.25 μm CMOS technology**
- **radiation-tolerant layout (hardness by design):**
 - enclosed layout transistors (ELT)
 - guard rings
- **pixel size 172 μm x 172 μm**
- **chip size 10.5 mm x 17.5 mm**
- **pin compatibility with PILATUS2 ASIC**

PILATUS3 X-Ray Detector Series: Experimental Results

- **local count rates of more than 10^7 photons per second and pixel**
- **global rates of more than 3×10^8 photons per second and mm^2**

Typical count rate characteristics (measured count rate versus incoming photon rate) of PILATUS2 and PILATUS3 X-ray detectors. (Continuous source, photon energy 8 keV, mid gain, threshold energy 5.5 keV)

PILATUS3 X-Ray Detector Series: Count Rate Correction

- Monte-Carlo circuit simulations considering beam parameters (incl. bunch structure of synchrotron beam) and transistor-level circuit parameters (e.g. gain and threshold)
- very good agreement between simulation and experimental data (up to more than 10 Mcps incoming photon rate in retriggered counting mode)
- „Improved count rate corrections for Highest Data Quality with PILATUS Detectors“ (P. Trüb et al. SRI 2012 proceedings, in review)

paralyzable counting mode

retriggered counting mode

High-Speed Readout Electronics: Features

- **new detector control board (DCB):**
 - 10GbE (10Gb/s-Ethernet instead of GigaSTaR)
 - Xilinx Virtex-6 FPGA
 - up to 16 BCB per DCB
- **new bank control board (BCB):**
 - Xilinx Virtex-6 FPGA
 - up to 6 modules per BCB
- **up to 12 Gb/s total data rate from PILATUS3 2M and 6M detectors**

New detector control board (DCB).

New bank control board (BCB).

PILATUS3

Main features

- PILATUS3 and DCBe technology
- available for all PILATUS models except 100K
- 320, 450 and 1000 μm sensors

First DECTRIS detector series

Applications

- Macromolecular crystallography
- Small-molecule crystallography
- Surface diffraction and reflectometry
- Scanning beam imaging (sSAXS, ptychography)
- Time-resolved experiments
- SAXS, WAXS and GISAXS

PILATUS3 300K & 300K-W

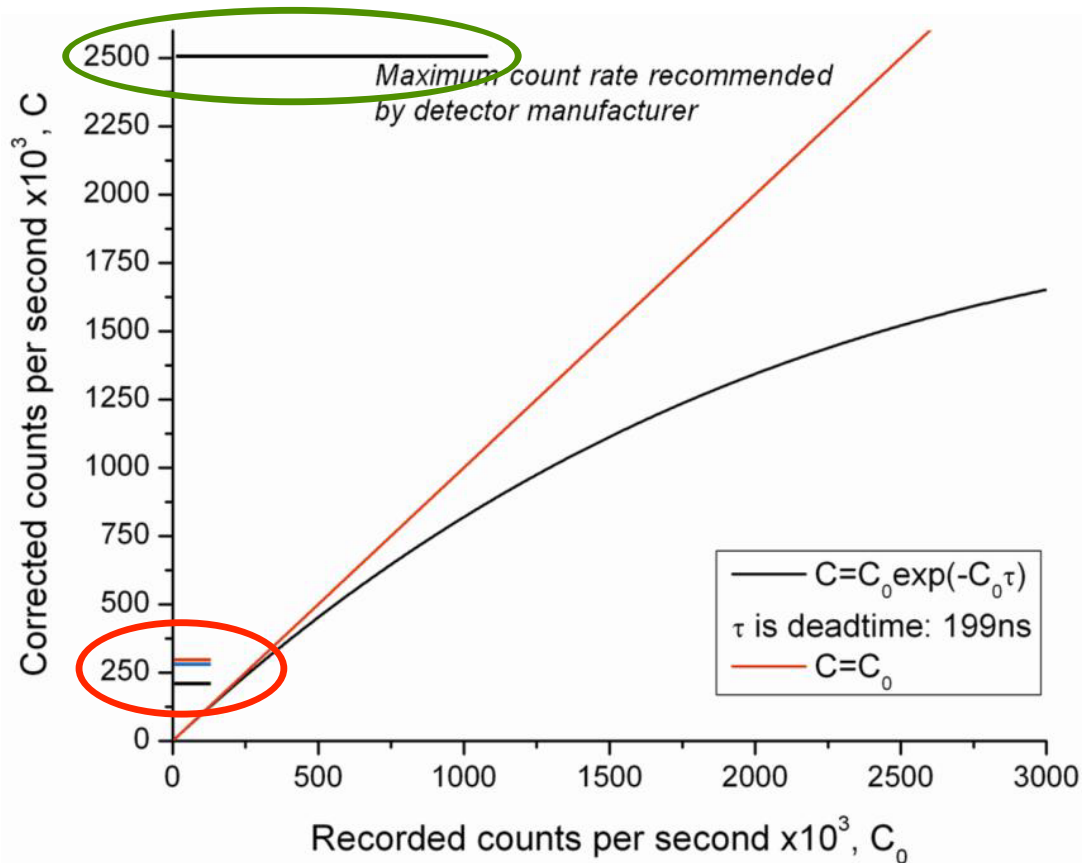

- water-cooled modules and electronics
- vacuum compatibility to 10^{-4} mbar
- extremely compact housing
- 500 Hz frame rates

PILATUS3 X-Ray Detector Series: Performance Summary

Parameter	Value
pixel size	172 μm x 172 μm
threshold energy range (typical)	3 – 21 keV
counter size	20 bit
max. count rate (pixel)	> 10 Mcps incoming rate
max. photon rate	> 3×10^8 photons/s/mm ²
absolute count rate error (with rate correction)	< 1 % @ 1 Mcps incoming rate < 10 % @ 10 Mcps incoming rate
readout time	0.95 ms
max. frame rate	500 Hz (100 – 500 Hz)

Dead-time correction in MX

- DIAMOND I24: 10^{12} phts/s in $100 \mu\text{m}^2$
- Maximum count-rates observed $\sim 250'000$ cts/s
- 5.6% dead-time correction for strongest reflection
- PILATUS fully compatible with current MX count rates
- PILATUS3 ready for future beamlines

R.L Owen *et al.*, Acta Cryst. (2012). D68, 810–818

Darwin's Formula

$$I(\mathbf{hkl}) = I_{\text{beam}} r_e^2 \frac{V_{\text{xtal}}}{V_{\text{cell}}} \frac{\lambda^3 L}{\omega V_{\text{cell}}} P A |F(\mathbf{hkl})|^2$$

C. G. Darwin (1914)

I(hkl)	- photons/spot (fully-recorded)	ω	- rotation speed (radians/s)
I_{beam}	- incident (photons/s/m ²)	L	- Lorentz factor (speed/speed)
r_e	- classical electron radius (2.818x10 ⁻¹⁵ m)	P	- polarization factor (1+cos ² (2θ) - P _{fac} ·cos(2Φ)sin ² (2θ))/2
V_{xtal}	- volume of crystal (in m ³)	A	- attenuation factor exp(-μ _{xtal} ·l _{path})
V_{cell}	- volume of unit cell (in m ³)	F(hkl)	- structure factor amplitude (e ⁻)
λ	- x-ray wavelength (in meters!)		

Small molecules: $F_{\text{sm}} \sim F_{\text{protein}}$
 $V_{\text{cell}} = V_{\text{cell protein}} / 1000$

$$I(\mathbf{hkl})_{\text{sm}} \sim 10^6 * I(\mathbf{hkl})_{\text{protein}}$$

What is it good for?

	Readout time [ms]	Frame rate [Hz]	Exposure time [ms]	Duty cycle [%]	Max. counts/pix/frame	Max. Mcts/pix/sec.
PILATUS 300K	2.23	300	1.1	33.3	2200	0.66
PILATUS 3 300K	0.95	500	1.05	52.5	10500	5.25
PILATUS 6M-F	2.23	25	37.77	94.4	75540	1.8885
PILATUS 3 6M	0.95	100	9.05	90.5	90500	9.05

PILATUS3 allows data to be taken at higher frame rates and with better statistics

Conclusions

- ***DECTRIS instant retrigger technology for non-paralyzable counting***
- ***reduced read-out time and increased frame rates***
- ***improved accuracy of count rate correction***
- ***complete PILATUS3 X-ray detector series***

- ***count rate capability compatible with MX at SR facilities and Small Molecule Crystallography (SMX) in the laboratory***
- ***count rate capability incompatible with SMX with unattenuated SR beams and with FEL applications***

- ***compatibility with CdTe sensors***
