Condor to CREAM submission

- Rod Walker, LMU Munich, 5th May 2011

- Request for LCG to give support for Condor to Cream submission
 - ATLAS usage
 - The Problem
 - Requirements
 - Alternatives
 - Conclusion

ATLAS usage

- 90% of official production uses pilots submitted by Condor to LCG and CREAM CEs
 - US also using Condor
 - NDGF(ARC), IT use gliteWMS with Condor backup
 - LCG CEs disappearing
 - now increasingly have cream-only sites
- Most user analysis uses Panda and hence same split as above
 - gliteWMS analysis exists

The Problem

- Condor-GT2 at scale had some problems
 - memory blow-up/leaks, occasional crashes
 - all overcome in Condor patch/dev cycle
- Increase in Cream CEs find new problems
 - lease renewal, crashes teething problems
 - timeouts on bulk status request
 - since a few weeks the GridManager process crashes every hour or so
 - submission works, but degraded due to frequent restart and initialization
 - log and core analysis shows memory corruption problem

Somebody Else's Problem

- Really it was always SEP
 - heavy LCG involvement made Condor-GT2 robust
 - used in RB
 - ATLAS manpower now moved to operations
 - no time for methodical analysis during production ops
- Requires:
 - help when problems arise
 - coordination between CreamCE and Condor developers
 - functional and scaling tests for significant Cream/Condor changes

Practically

- Install condor-7.6.0-1.rhel5.x86_64.rpm and submit some jobs
 - grid_resource=cream grid-cr5.desy.de:8443/ce-cream/services/CREAM2 pbs atlas
 - queue 100
- Occasional bursts of LCG person activity
 - when there is a problem
 - re-validate for major cream/condor changes
 - perhaps involves observation of problem Condor in ATLAS prod(3@CERN)
 - ~10% FTE and will get less
- Expect current problem will be solved before any LCG action

Alternatives

- Could say problem with Condor should make us look elsewhere
 - gliteWMS bad memories, no going back!
 - still looks difficult to operate service, scaling doubts
 - doesn't cover the US
 - OTOH we do have a working pilot factory(D.Rebatto)
 - sustaining 20k running jobs for a week might convince
 - direct cream submission from factory
 - Does this scale? Tracking jobs, getting outputs, control?
 - All the bits Condor does?
 - Quicker death of LCGCE and tie-in to Cream

Conclusion

- Interface issues with major external client package falls under LCG/EGI(?) remit
 - continuation of Condor-GT2 support
 - expertise and contacts exist
- ATLAS would be grateful
