

Presentation of latest results

A first measurement of the emittance of the MICE muon beam

Mark Alastair Rayner

Université de Genève

30th collaboration meeting of the MICE experiment

The University of Oxford

7/7/2011

AMDG-LDS

Raw 6 mm data (including 1000/1024 correction)

(6 mm, 140 MeV/c) μ^-

(6 mm, 200 MeV/c) μ^-

(6 mm, 240 MeV/c) μ^-

(6 mm, 140 MeV/c) μ^+

(6 mm, 200 MeV/c) μ^+

(6 mm, 240 MeV/c) μ^+

L between TOF centre planes

Corners A, B, C, D , centre planes $\hat{n} \cdot (\vec{r} - \vec{r}_0) = 0$

\hat{n} is the normal, obtained from $\vec{AC} \times \vec{BD}$

\vec{r}_0 is the centre of the detector, deduced from $\vec{AC} + \vec{BD}$

Unrotated TOF would sit in $z = z_0$ where $\hat{n} = \hat{z}$

Tilt (dihedral angle) given by $\cos \alpha = \hat{n}_1 \cdot \hat{n}_2$

TOF0 normal = $(-0.467, -0.509, 99.998)$, $\alpha = 0.396$ deg

TOF1 normal = $(-0.927, -1.423, 99.986)$, $\alpha = 0.974$ deg

$(20 \text{ cm}) \sin 1^\circ = 3.5 \text{ mm} \Rightarrow$ uncertainty on L

Middles of the detector (from the survey recon)

TOF0 $\vec{r}_0 = (1.8, 2.6, 5293.8)$ mm, TOF1 $\vec{r}_0 = (30.2, -17.6, 12999.0)$ mm

Intersection with design orbit at $z_{\text{design}} = \hat{n} \cdot \vec{r}_0 / \hat{n}_z$

TOF0 $z_{\text{design}} = 5293.7$ mm, TOF1 $z_{\text{design}} = 12999.0$ mm

Position of the e^\pm peak in raw data

(6 mm, 140 MeV/c) raw data

(6 mm, 200 MeV/c) raw data

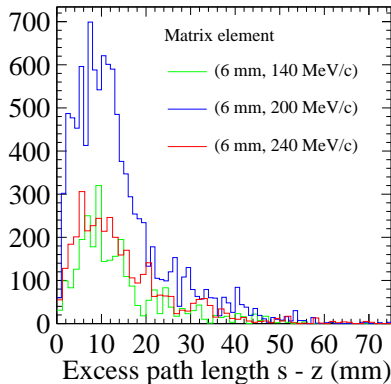

(6 mm, 240 MeV/c) raw data

$\langle t_e^{\text{data}} \rangle$	Electrons	Positrons
(6 mm, 140 MeV/c)	25.366 ns \pm 3 ps	25.303 ns \pm 3 ps
(6 mm, 200 MeV/c)	25.369 ns \pm 3 ps	25.298 ns \pm 2 ps
(6 mm, 240 MeV/c)	25.370 ns \pm 9 ps	25.289 ns \pm 4 ps

Monte Carlo electrons

Monte Carlo positrons

$\langle \delta_e^{\text{sim}} \rangle$	Electrons	Positrons
(6 mm, 140 MeV/c)	13.9 ± 0.2 mm	10.9 ± 0.3 mm
(6 mm, 200 MeV/c)	13.8 ± 0.1 mm	11.0 ± 0.1 mm
(6 mm, 240 MeV/c)	14.6 ± 0.2 mm	12.7 ± 0.7 mm

Corrected 6 mm data

(6 mm, 140 MeV/c) μ^-

(6 mm, 200 MeV/c) μ^-

(6 mm, 240 MeV/c) μ^-

(6 mm, 140 MeV/c) μ^+

(6 mm, 200 MeV/c) μ^+

(6 mm, 240 MeV/c) μ^+

Systematic uncertainty on p_z

A precise measurement based on $p/E = L/t$

In units where $c = 1$,

$$E_\mu/p_\mu (L + \delta_\mu^{\text{calc}}) = k (t_\mu - \langle t_e^{\text{data}} \rangle) + (L + \langle \delta_e^{\text{sim}} \rangle)$$

Variable	Resolution	Comment
L	3 mm \equiv 12 ps	Survey resolution plus tilt uncertainty
	1.5 cm \equiv 50 ps	Elbow uncertainty
	5 cm \equiv 170 ps	Survey misinterpreted
k	$10^{-5} \equiv 0.3$ ps	Previous analyses assumed 25 ps rather than 24.414 ps TDC bins \Rightarrow 0.6 ns error
$\langle t_e^{\text{data}} \rangle$	35 ps	\therefore don't understand e^+/e^- discrepancy, apply separate $+/-$ correction
$\langle \delta_e^{\text{sim}} \rangle$	0.5 mm \equiv 2 ps	Apply M.C. correction based on polarity and p_z of matrix element

Systematic error on p_z 

p_z data/simulation comparison

(6 mm, 140 MeV/c) μ^-

(6 mm, 200 MeV/c) μ^-

(6 mm, 240 MeV/c) μ^-

(6 mm, 140 MeV/c) μ^+

(6 mm, 200 MeV/c) μ^+

(6 mm, 240 MeV/c) μ^+

Mean p_z	Rec. sim.	Data
(6 mm, 140 MeV/c) μ^-	174.80 ± 1.5	174.78 ± 1.5
(6 mm, 140 MeV/c) μ^+	178.66 ± 1.5	173.89 ± 1.5
(6 mm, 240 MeV/c) μ^-	273.01 ± 3.5	270.68 ± 3.5
(6 mm, 240 MeV/c) μ^+	272.44 ± 3.5	267.90 ± 3.5
(6 mm, 200 MeV/c) μ^-	230.95 ± 2.5	230.85 ± 2.5
(6 mm, 200 MeV/c) μ^+	233.03 ± 2.5	227.01 ± 2.5

Statistical errors only:

RMS p_z	Rec. sim.	Data
(6 mm, 140 MeV/c) μ^-	21.16 ± 0.15	24.51 ± 0.13
(6 mm, 140 MeV/c) μ^+	25.97 ± 0.32	26.12 ± 0.08
(6 mm, 200 MeV/c) μ^-	23.19 ± 0.05	25.38 ± 0.06
(6 mm, 200 MeV/c) μ^+	29.53 ± 0.11	27.60 ± 0.03
(6 mm, 240 MeV/c) μ^-	24.83 ± 0.05	28.04 ± 0.16
(6 mm, 240 MeV/c) μ^+	32.08 ± 0.30	30.65 ± 0.06

Step 1 G4MICE software suite

The applications:

Step1Ensemble

Applies Y.K.'s TOF calibration to data, obtains μ tracks

XCalibration

Extends Y.K.'s TOF calibration for timing based (x, y) measurements

Step1Reconstruction

Applies common/Step1Tracking to data

TestStep1Reconstruction

Applies resolutions and common/Step1Tracking to simulation

Step1Optics

Attempts to correct resolution bias on emittance (just for fun)

Step 1 G4MICE software suite

Reconstruction classes, common to data/simulation reconstruction:

common/Step1Tracking

Instantiates common/Step1BeamLine, and 10 common/Step1Iterations

common/Step1BeamLine

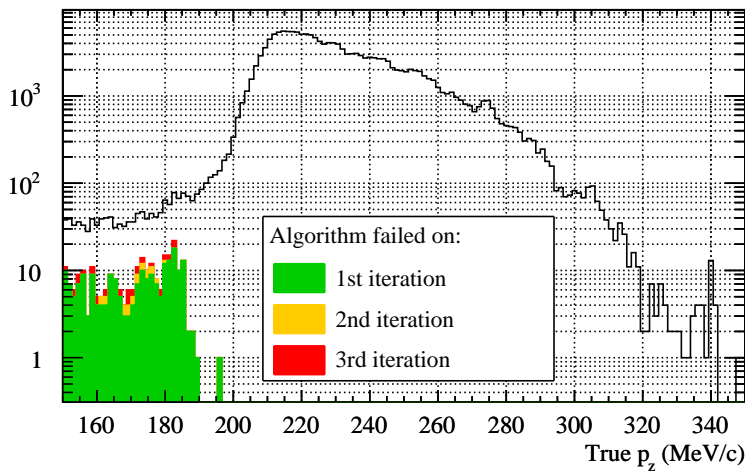

Holds info on geometry, provides $\mathbf{M}(p_z)$ and approximation of path length
User selects quad field model class (all inherit from Quadrupole):

- ThinLens
- TopHat
- FastQuad - default
- SliceQuad

common/Step1Iteration

Improves estimates of s , p_z , x' , and y'

Reconstruction efficiency

Caveat: need to apply 1000/1024 correction and χ^2 cut and re-calculate

An original summary plot (1000/1024 and χ^2 caveats)

Observations

All the beams have approximately constant size

Due to beam selection by detectors and scraping (60% in quadrupole 6)

$$\epsilon_x \approx 2\epsilon_y$$

Despite decay solenoid mixing, due to FDF-FDF?

μ^+ have higher emittance than μ^-

Due to proton absorber?

Low- p_z have higher emittance

Despite scaling the magnet currents to try to preserve the same trace space distributions

χ^2 cut will ameliorate the effect, not perfect scaling, and scraping dominant

Encouraging agreement with Monte Carlo!
