

CERN School of Computing 2024

Sunday 8 September 2024 - Saturday 21 September 2024

DESY

Academic Programme

The complete programme will offer over 50 hours of lectures and hands-on exercises. The programme is organized over three distinct tracks: Physics Computing, Software Engineering, and Data Technologies. In addition, guest lectures, student presentations and special evening talks will be organised.

(Please note that this programme may be subject to minor changes.)

A final programme will be released soon.

Exact lecture programme will be released **soon**.

Physics Computing

Introduction to Physics Computing

by Arnulf Quadt (University of Göttingen)

2h lectures

foundations of particle physics

introduction to the Standard Model

event filtering

calibration and alignment

event reconstruction

event simulation

physics analysis

data flow and computing resources

Data Science and Interactive Data Exploration

by Pere Mato (CERN)

2h lectures + 2h exercises

introduction, data science tools

using data from different sources

non-numeric data

Data Analysis

by Toni Šćulac (University of Split)

4h lectures + 3h exercises

introduction to data analysis

probability density functions and Monte Carlo methods

parameter estimation and confidence intervals

hypothesis testing and p-value

Introduction to Machine Learning

Lukas Alexander Heinrich (Technische Universität München)

3h lectures + 3h exercises

what is machine learning

learning algorithm, loss function, optimisation

overfitting and underfitting

machine learning in HEP

Software Engineering

Tools and Techniques

by Pere Mato (CERN)

2h lectures + 3h exercises

introduction to software engineering

test frameworks, memory checkers

collaborating on complex software

Software Design in the Many-Cores Era

by Andrei Gheata (CERN) and Stephan Hageboeck (CERN)

4h lectures + 3h exercises

Amdahl's and Gustafson's laws, data and task parallelism

parallel programming in C++, concurrency and synchronisation

performance and correctness - profiling and debugging multithreaded applications

patterns for parallel software development

Creating Secure Software

by Sebastian Lopienski (CERN)

3h lectures + 3h exercises

introduction to computer security

security in different phases of software development

web application security

Data Technologies

Data Management

by Alberto Pace (CERN)

5h lectures

data workflow, storage models and technologies

reliability and error correction

practical cryptography: hash functions, symmetric and asymmetric encryption, digital signatures

authentication, authorization and accounting: PKI, certificates, Kerberos, OpenID, OAuth etc.

distributed hash tables, block storage, data replication, caching

Data and Storage Technologies

by Andreas J. Peters (CERN)

1h lecture + 3h exercises

storage technologies: present and future

data formats and access patterns

optimizations in IO systems

redundancy, cloud storage

Data Visualization

by Eamonn Maguire (Proton, Switzerland)

2h lectures + 2h exercises

data visualization: theory and practical applications

multi-dimensional data visualization

Additional lectures

Student lightning talks session
