Abstract

We present results from exploratory studies, supported by the Physics Beyond Colliders (PBC) Study Group, of the suitability of a CERN site and its infrastructure for hosting a vertical atom interferometer (AI) with a baseline of about 100 m. We first review the scientific motivations for such an experiment to search for ultralight dark matter and measure gravitational waves, and then outline the general technical requirements for such an atom interferometer, using the AION-100 project as an example. We present a possible CERN site in the PX46 access shaft to the Large Hadron Collider (LHC), including the motivations for this choice and a description of its infrastructure. We then assess its compliance with the technical requirements of such an experiment and what upgrades may be needed. We analyse issues related to the proximity of the LHC machine and its ancillary hardware and present a preliminary safety analysis and the required mitigation measures and infrastructure modifications. In conclusion, we identify primary cost drivers and describe constraints on the experimental installation and operation schedules arising from LHC operation. We find no technical obstacles: the CERN site is a very promising location for an AI experiment with a vertical baseline of about 100 m.

TVLBAI workshop series launched

<https://indico.cern.ch/event/1208783/>

Mar 13 – 14, 2023 > CERN

Terrestrial Very-Long-Baseline Atom Interferometry

WORKSHOP

The event will take stock of the developing international landscape of large-scale Atom Interferometer prototypes and discuss their synergies and complementarity. Such devices will be able to detect ultralight dark matter and gravitational waves in the mid-frequency band, complementing the capabilities of optical interferometers on Earth and the future LISA space mission, and offering unique sensitivity to ultralight bosonic dark matter.

The primary objectives of the workshop are to discuss the technology and physics drivers for large-scale Atom Interferometry as well as to establish the foundation for an international TVLBAI proto-collaboration. This proto-collaborative effort aims to bring together researchers from diverse institutions, fostering strategic discussions and securing funding for terrestrial large-scale Atom Interferometer projects. The goal is to develop a comprehensive roadmap outlining design choices, technological considerations, and science drivers for one or more kilometer-scale detectors, expected to become operational in the mid-2030s.

LHC Point 4

Selected location: PX46

Selected location: PX46

Views at the surface

View from below

Transport of LHC components and proposed layout

Evaluation of PX46 as suitable site for an AI

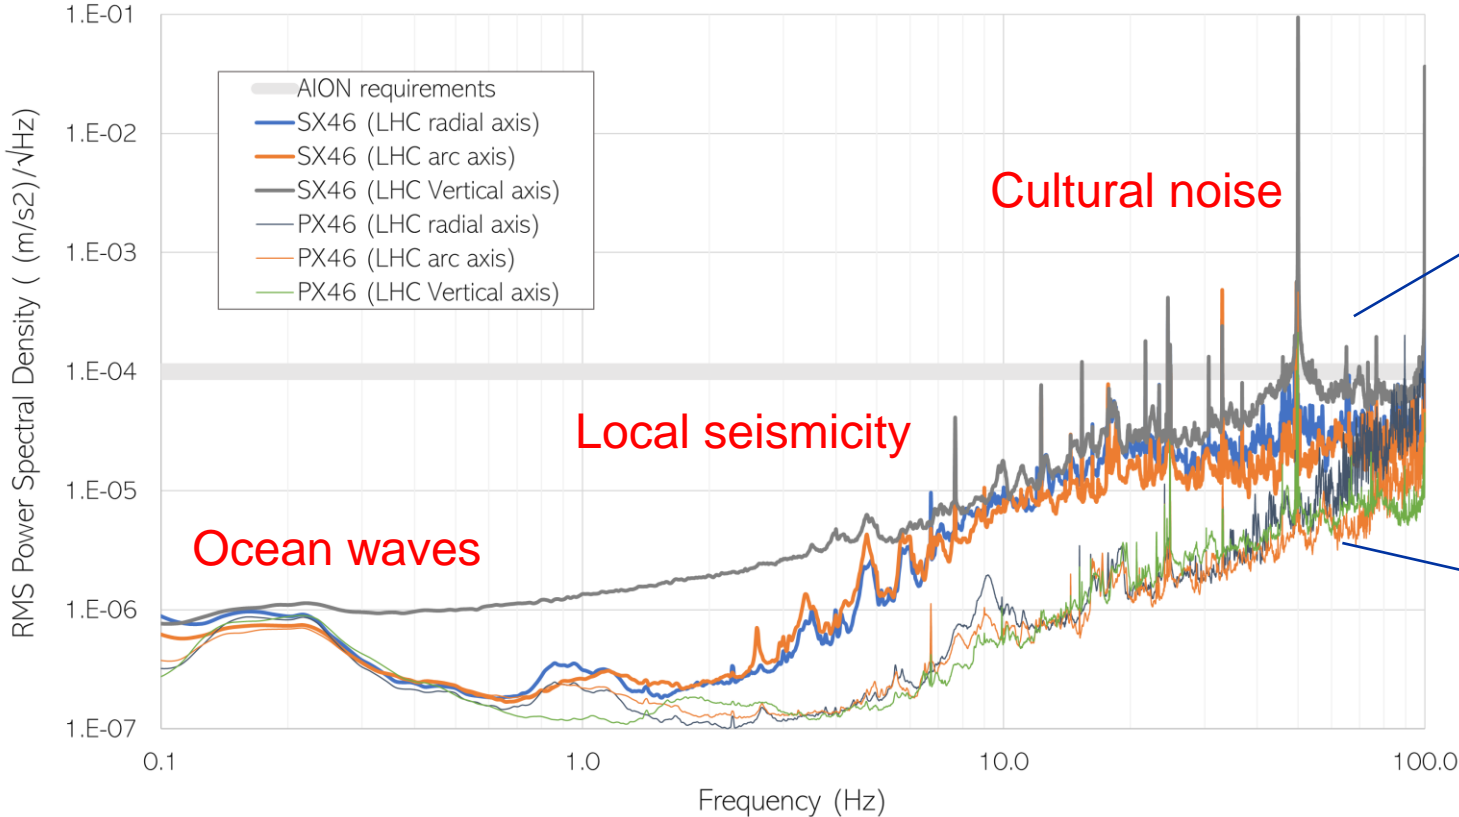

Can the AI in PX46 be accessed at all times?

- **Compatibility** with technical requirements for an AI – **influence** of the LHC
 - Vibrations, seismic noise and local geology
 - EM noise

 - Radiation protection
 - Fire safety
 - He release hazards
 - Access control
- **Available infrastructure**
 - Electrical supply, network, etc.
 - HVAC

Vibrations and seismic noise

PX46 / SX46 Ground motion overview

Measured at top of PX46

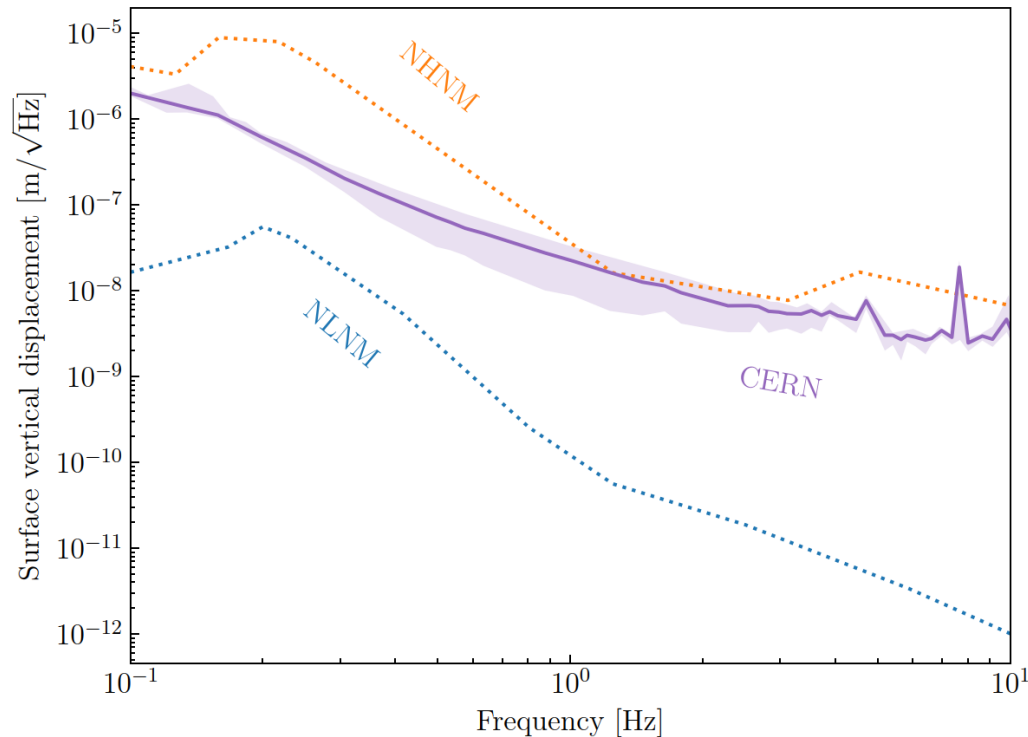

Measured at bottom of PX46

RMS power spectral density (time block 64s, averaged over the worst day)

✓ Measured values within acceptable limits

Effect of local geology: gravity gradient noise

Seismic gravity gradient noise (GGN): seismic waves disturb local mass distribution, cause oscillating gravity gradient that is a noise background (especially important at lower frequencies)

Calculated using RMS spectral density of surface vertical displacement measurements, the shaded band corresponds to the difference between the minimum and maximum daily measurements. Compared with the New High and Low Noise Models (NENM and NLNM: USGS seismic models for hypothetical quiet and noisy sites).

EM noise

Power spectral density low-frequency magnetic field measurement

✓ Measured values within acceptable limits

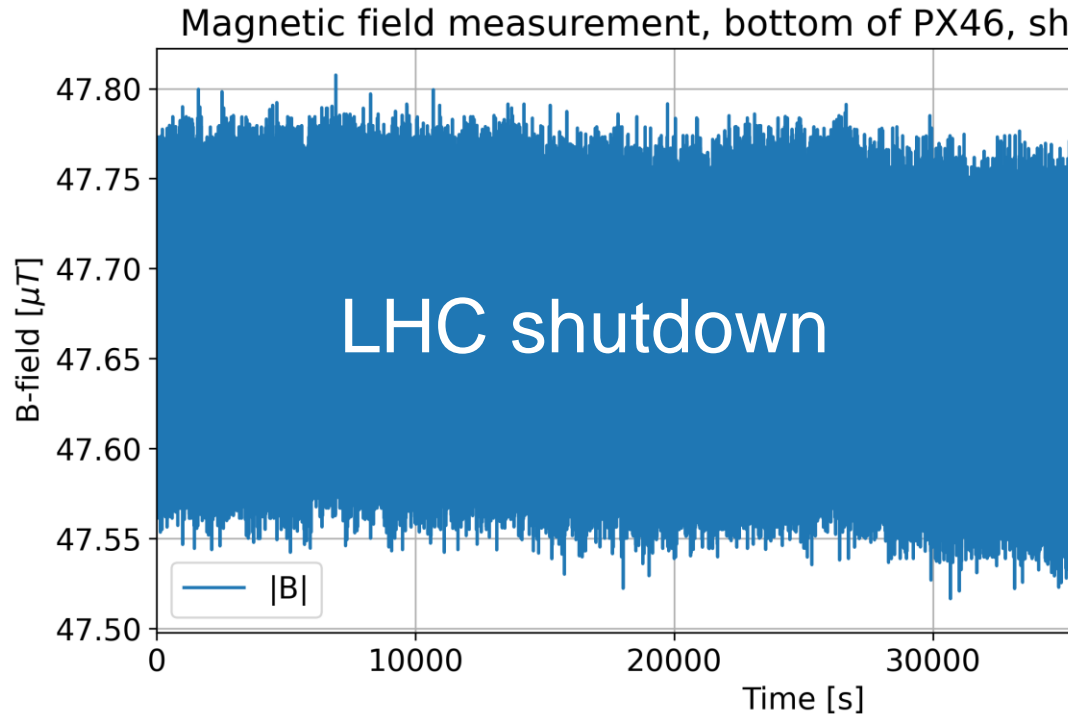

Installation 2022 (thanks EN-MME, EN-ACE, EN-HE, EN-CV)

With the measurement probe

Effect of LHC magnets

Drift or steps in magnetic field of $\gtrsim 50\text{nT}$ are a potential concern for the side-arms and the detector.

➤ Measured values within acceptable limits

Radiation protection

Beam loss in RUX45 with 0.8 m shielding in TX46

DOSE EQUIVALENT (ACCIDENT) - OPTION 1 - BEAM 1 - EMF ON

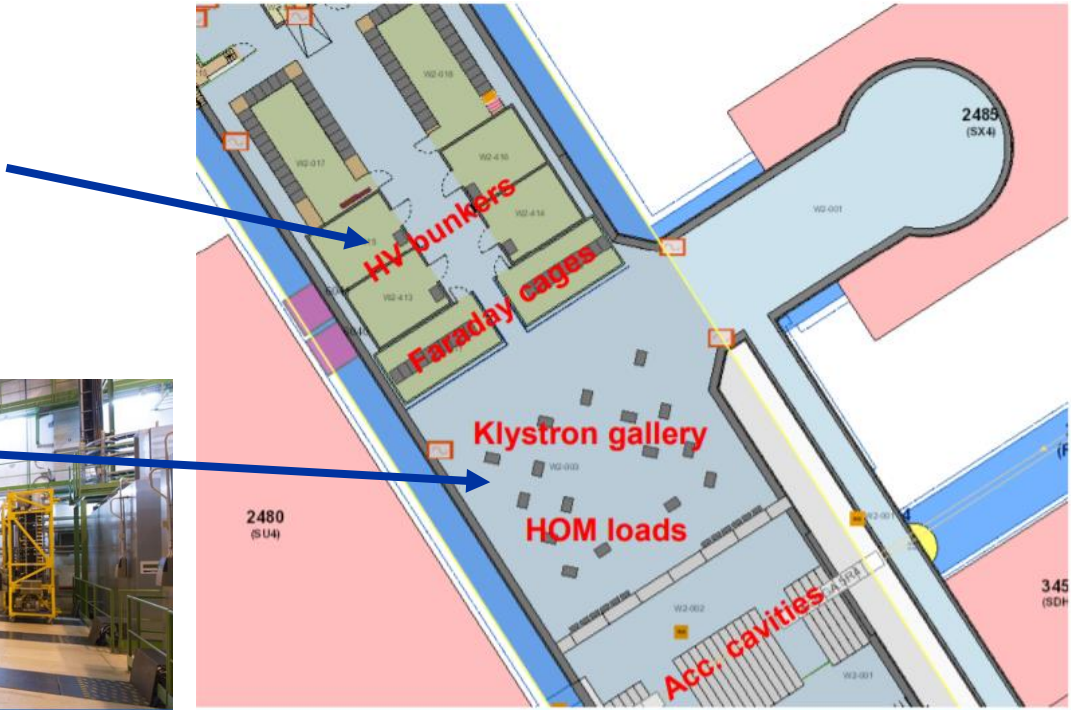

DOSE EQUIVALENT (ACCIDENT) - OPTION 1 - BEAM 2 - EMF ON

Area	Annual dose limit E [mSv] year	Assuming 20% working time Ambient dose equivalent rate $\dot{H}^*(10)$ [$\mu\text{Sv/h}$]	
		permanent occupancy	low occupancy
Non-designated	1	0.5	2.5
Supervised	6	3	15

- No concern during normal LHC beam operations
- In case of beam loss, radiation levels remain within acceptable limits (supervised area)
- Thickness of shielding wall to be optimized

Fire safety

In case of a fire in UX45 (klystron gallery):

- Smoke detection -> Alarms -> Evacuation with elevator in ~2 min via top of PX46
- In case of systems failure: controlled descent in ~2 min to bottom of PX46 and exit via PM45 or PZ45

Elevator: from artist view to conceptual design

A design that complies with all requirements is technically feasible as demonstrated by an external consultant:

- Powered from electrical network
- Backup battery powered
- Controlled descent in case of battery failure

Helium release safety: LHC arcs

In case of major release from the LHC arcs,
 He is evacuated via PM45 via a set of confinement doors
 ➤ No hazard in PX46 from He release in the LHC arcs

Helium release safety: RF cryomodules

- RF cryomodules contain 320 x 4 liters of liquid He; in case of release it is evacuated via PX46
- Flow restrained by the small openings (RF waveguides)
- 970 m³ of gas compared to 18000 m³ of the cavern (<~ 20%), oxygen deficiency hazard is limited
- Measured in 2023 (info T. Hakulinen) : **no change in O₂ % in TU46 due to He release from RF cryomodules**

Access control

End-of-zone door of the LHC Access Safety System (LASS), for emergency exit at the bottom of PX46
Red in color and including an **emergency opening handle** on both sides

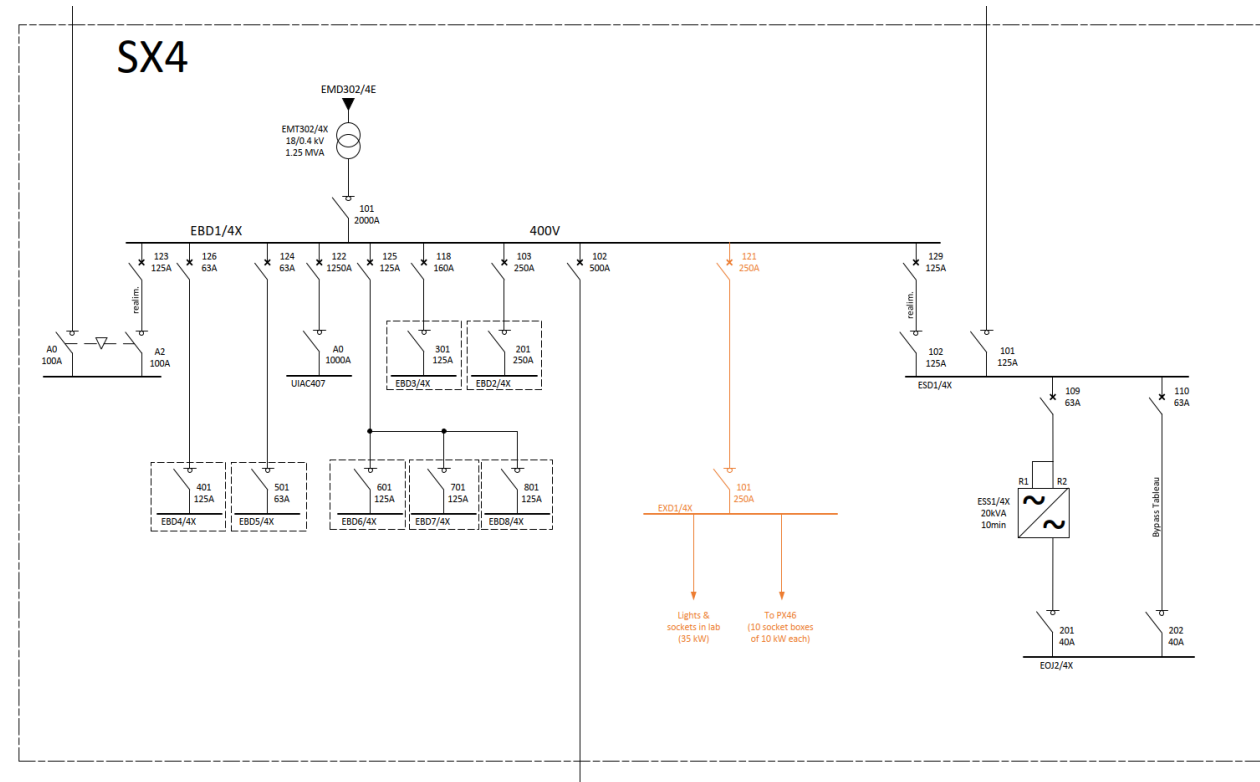

Standard LHC Access Control System (LACS) door. Probably a **lightweight solution** could be installed at the top platform of PX46, since **access to the AI will NOT be an access to the LHC**. Availability and use of oxygen-generating self-rescue masks to be assessed

Technical requirements

Requirement	Laser Lab	Interferometry region	Side-arm (per side-arm)
Volume	Floor area > 50 m ²	1 m ² cross-sectional area	1 m × 1 m × 2 m
Mains power	~ 35 kW (three- and single-phase outlets)	∅(100 W) diagnostic and monitoring electronics	∅(10kW)
Control cables	Ethernet, fibre, coaxial	Magnetic coils, diagnostic and monitoring electronics	optical fibres, coaxial, high-power steel-clad fibers
Temperature stability	22 °C w/ ± 1 °C pk-pk	< 1 °C h ⁻¹	Temperature controlled, NEMA rated enclosure, < 0.5 °C pk-pk
Water cooling	30 kW cooling capacity	n/a	5 kW cooling capacity, < ±1 °C stability
Laser safety	Engineering (enclosures, interlocks); admin (training); PPE (glasses)	Already safe (enclosed)	Engineering (enclosures); admin (training); PPE (glasses)
Gases	Helium, compressed air, Argon	n/a	Helium for commissioning
Cryogenics	n/a	n/a	n/a
Ventilation	Air-handling unit capable of temp. spec.	Air-flow to maintain temp. spec.	Air-flow to move 5 kW of heat
Access	Year-round (> 12 hrs/day)	Access for maintenance (more access during calibration and commissioning)	Year-round ~ 12 hrs/day (more R& D for fully autonomous atom sources)
Smoke detector	Yes	Yes	Yes
Oxygen depletion monitor	Yes	During maintenance	n/a
Hoisting equipment	n/a	Modular sections < 907 kg	n/a

PX46 - Existing conditions: electricity

- About 160 kW needed: interferometer + laser laboratory + elevator
- About 1.25 MVA available at the transformer in SX4 in front of a present consumption of 85 kVA
- As a consequence, no modifications of the electrical power distribution network are expected

New preliminary single line diagram of SX4, with the new feeder of EBD1/4X, the new switchboard EXD1/4X and its feeders in orange

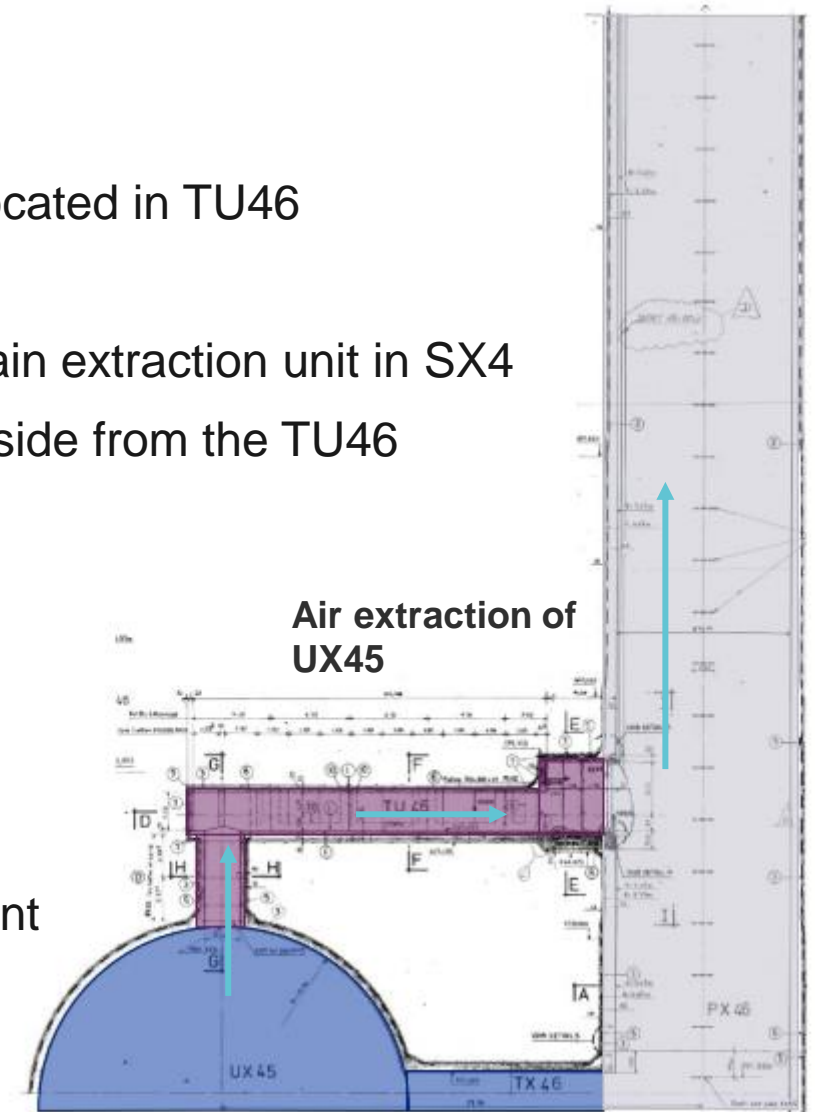

PX46 - Existing conditions: HVAC

Ventilation

- Air extraction from the UX45 is done at the top of the cavern by unit located in TU46
- Extracted air is then directly supplied in PX46 (no ducts in PX46)
- In surface, a duct is connected to the cap to collect extracted air to main extraction unit in SX4
- Existing CV platform at 24m from the bottom of the shaft, openable inside from the TU46
- All ventilation units are stopped if a fire is detected

Cooling

- Cooling system will be located on the surface and
- Water will be distributed to each side-arm
- Distribution piping will be installed along the full height of the experiment

Courtesy of R. Langlois

Conclusions and perspectives

- **No showstoppers** identified for installing an AI at LHC Point 4
 - Environmental noise measurements **comply with requirements** of an AI
 - Safety assessed and **potential hazards** identified
 - **Mitigation measures** related to LHC environment **identified** (RP, access control, etc.)
 - HVAC, electricity and other relevant **services are available**
- **Expected ~1.5 MCHF cost** for making the site infrastructure available for an AI, granting an access 24h/24 for subsequent installation and running of the experiment

Item	Cost [kCHF]
Shielding	400
Lifting platform	400
Access, safety systems and monitoring	200
General services and utilities	500
Total	1500

Class 5 estimates

Conclusions and perspectives

- **Next steps**
 - Creation of an **experimental Interferometer**

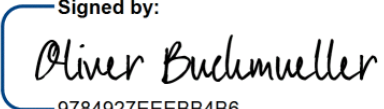

**Memorandum of Understanding

Light vs. Cold Atoms: Atom Interferometry

Light
interferometer

Interferometry
of light waves

Atom
interferometer

Interferometry
of matter waves

What is an atom interferometer? Based on atom clock

Light pulse atom interferometry

2) At $t = T$, the wave packet is fully separated, and a mirror sequence reverses the momentum states of the two halves of the cloud.

1) The ultra-cold atom cloud is launched vertically. At $t = 0$, the first laser beam splitter sequence splits the cloud into a superposition of momentum states separated by $n\hbar k$

STANFORD UNIVERSITY

3) At $t = 2T$, the clouds spatially overlap.

The De Broglie waves interfere, and the pattern is extremely sensitive to the gravity g experienced by the atom clouds

Coupled atom sources have a large potential for measurement
Gravitational Waves and Dark Matter
