

# A status on gravitational waves detection and some prospects

Damir Buskalic

LHC Days in Split, september 2024

# Gravitational waves

- ▶ Consequence of the theory of General Relativity (GR)
- ▶ Einstein 1916 – 1918
  - ▶ Geometric theory of gravitation
  - ▶ Describes the curvature of space-time and interaction btw space-time and energy-matter

688 Sitzung der physikalisch-mathematischen Klasse vom 22. Juni 1916

## Näherungsweise Integration der Feldgleichungen der Gravitation.

VON A. EINSTEIN.

Bei der Behandlung der meisten speziellen (nicht prinzipiellen) Probleme auf dem Gebiete der Gravitationstheorie kann man sich damit begnügen, die  $g_{\mu\nu}$  in erster Näherung zu berechnen. Dabei bedient man sich mit Vorteil der imaginären Zeitvariable  $x_4 = it$  aus denselben Gründen wie in der speziellen Relativitätstheorie. Unter »erster Näherung« ist dabei verstanden, daß die durch die Gleichung

$$g_{\mu\nu} = -\delta_{\mu\nu} + \gamma_{\mu\nu} \quad (1)$$

definierten Größen  $\gamma_{\mu\nu}$ , welche linearen orthogonalen Transformationen gegenüber Tensorcharakter besitzen, gegen 1 als kleine Größen behandelt werden können, deren Quadrate und Produkte gegen die ersten Potenzen vernachlässigt werden dürfen. Dabei ist  $\delta_{\mu\nu} = \delta_{\mu\nu}^0$

- ▶ Develop small perturbations  $h_{\mu\nu}$  around a flat (Minkowski) metric
- ▶ => wave equation

$$\left(\nabla^2 - \frac{1}{c^2} \frac{\partial^2}{\partial t^2}\right) h_{\mu\nu} = 0$$

# Gravitational waves

- ▶ Effect on a set of (free) “test” mass

# Gravitational waves

► Production :

► Distribution of masses : acceleration of quadrupolar moment

$$h \approx 32\pi^2 \cdot \frac{G}{c^4} \cdot \frac{1}{r} \cdot M \cdot R^2 \cdot f_{orb}^2$$

► Examples

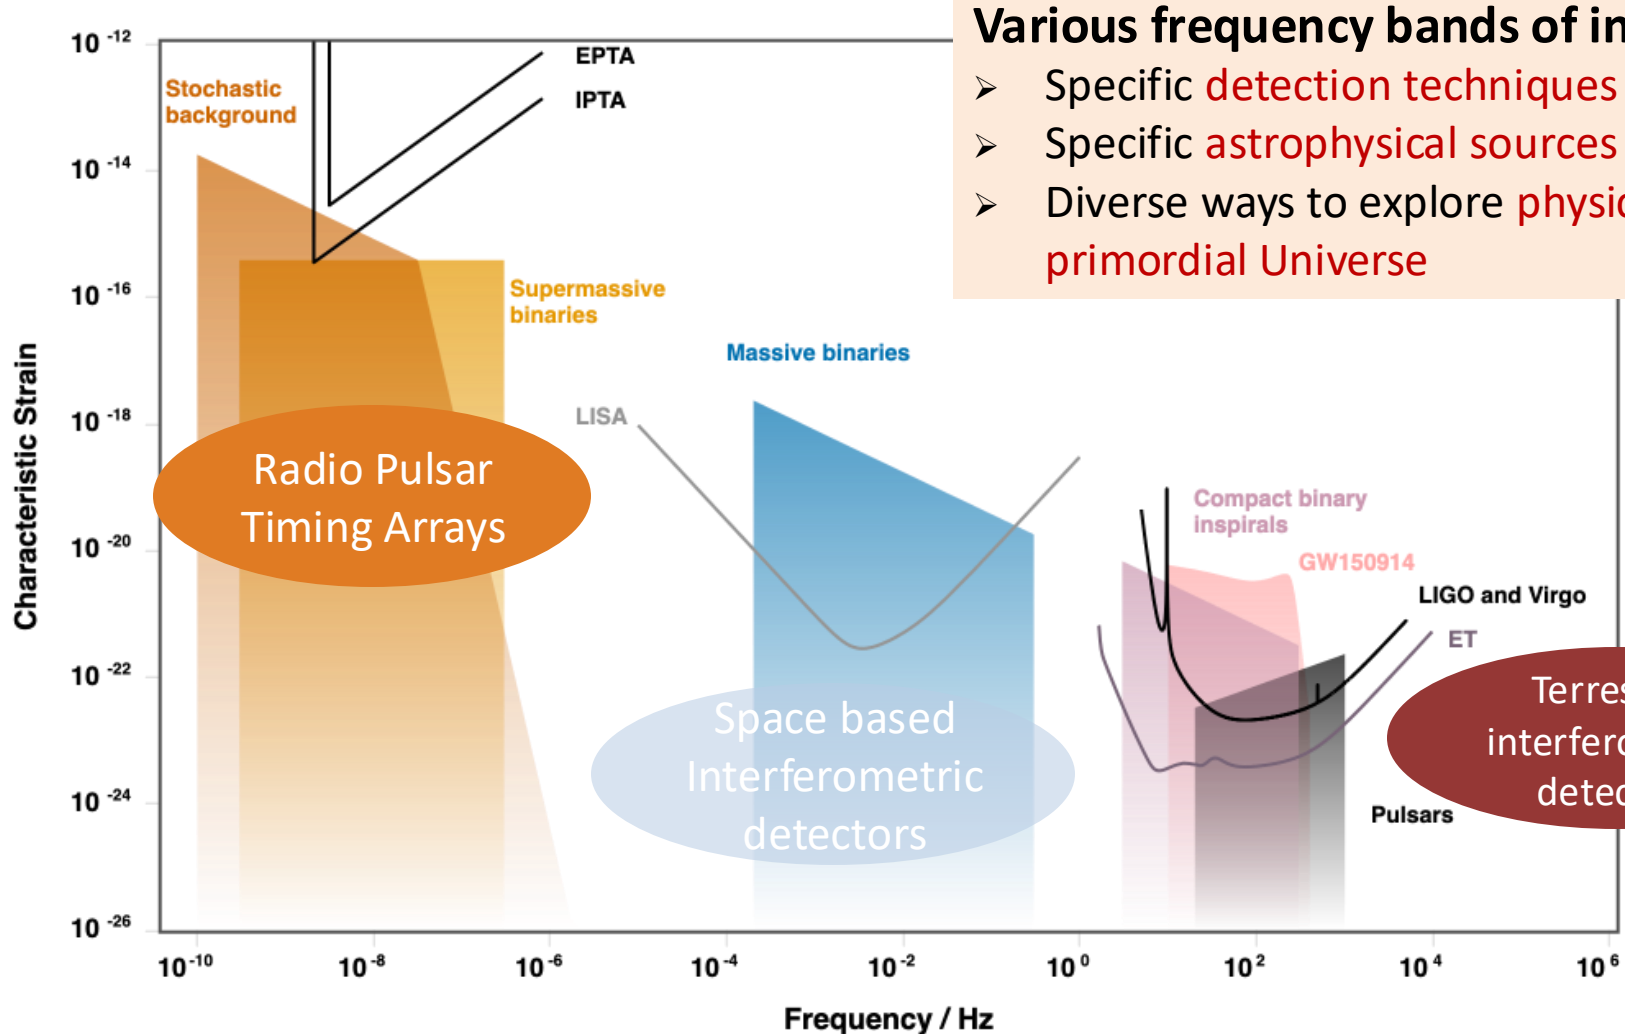

- $M = 1000 \text{ kg}$ ,  $R = 1 \text{ m}$ ,  $f = 1 \text{ kHz}$ ,  
 $r = 300 \text{ m}$

$$h \sim 10^{-35}$$

- $M = 1.4 M_{\odot}$  ,  $R = 20 \text{ km}$ ,  $f = 400 \text{ Hz}$ ,  
 $r = 10^{23} \text{ m}$  (15 Mpc = 48,9 Mlyr )

$$h \sim 10^{-21}$$

# Gravitational waves sources and detectors

## Various frequency bands of interest

- Specific **detection techniques**
- Specific **astrophysical sources**
- Diverse ways to explore **physics of primordial Universe**

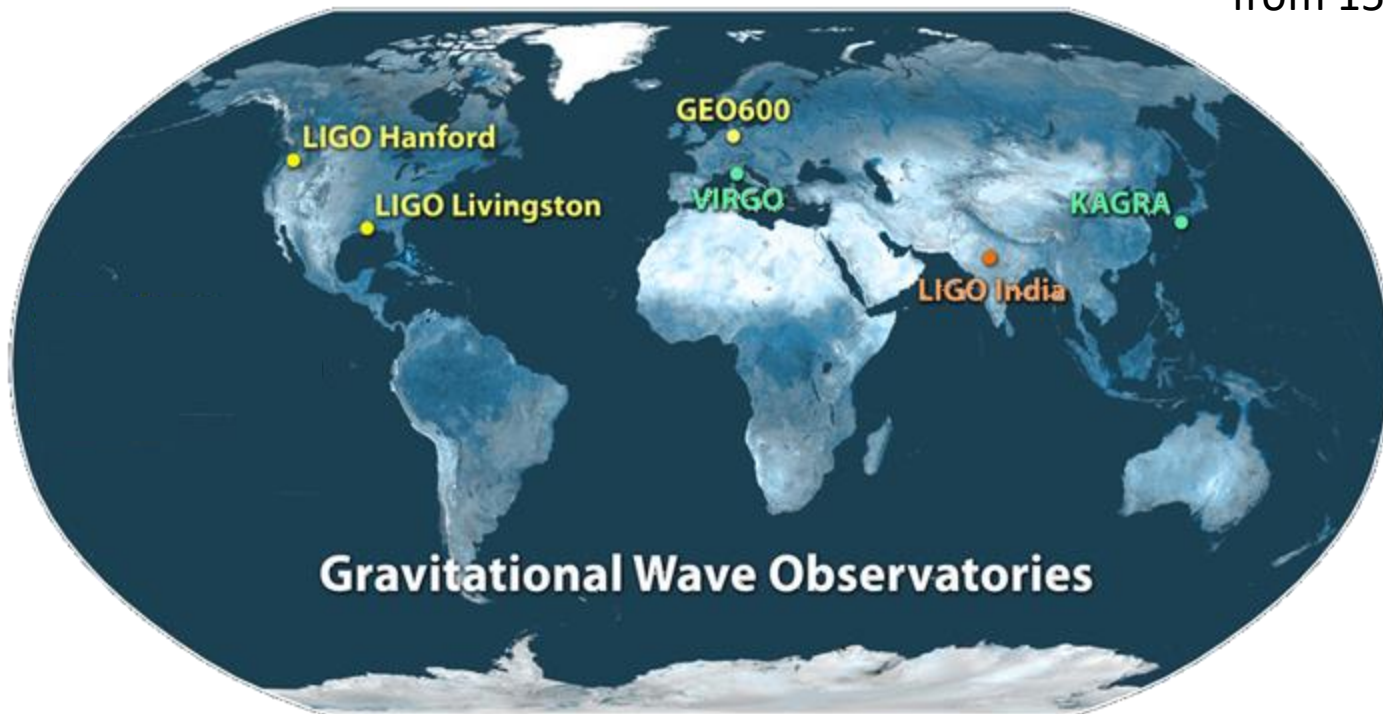

# The observed : LIGO-Virgo-Kagra results

# LVK Gravitational waves detector network

**LSC** : ~1500+ members  
~127 institutions  
from ~19 countries

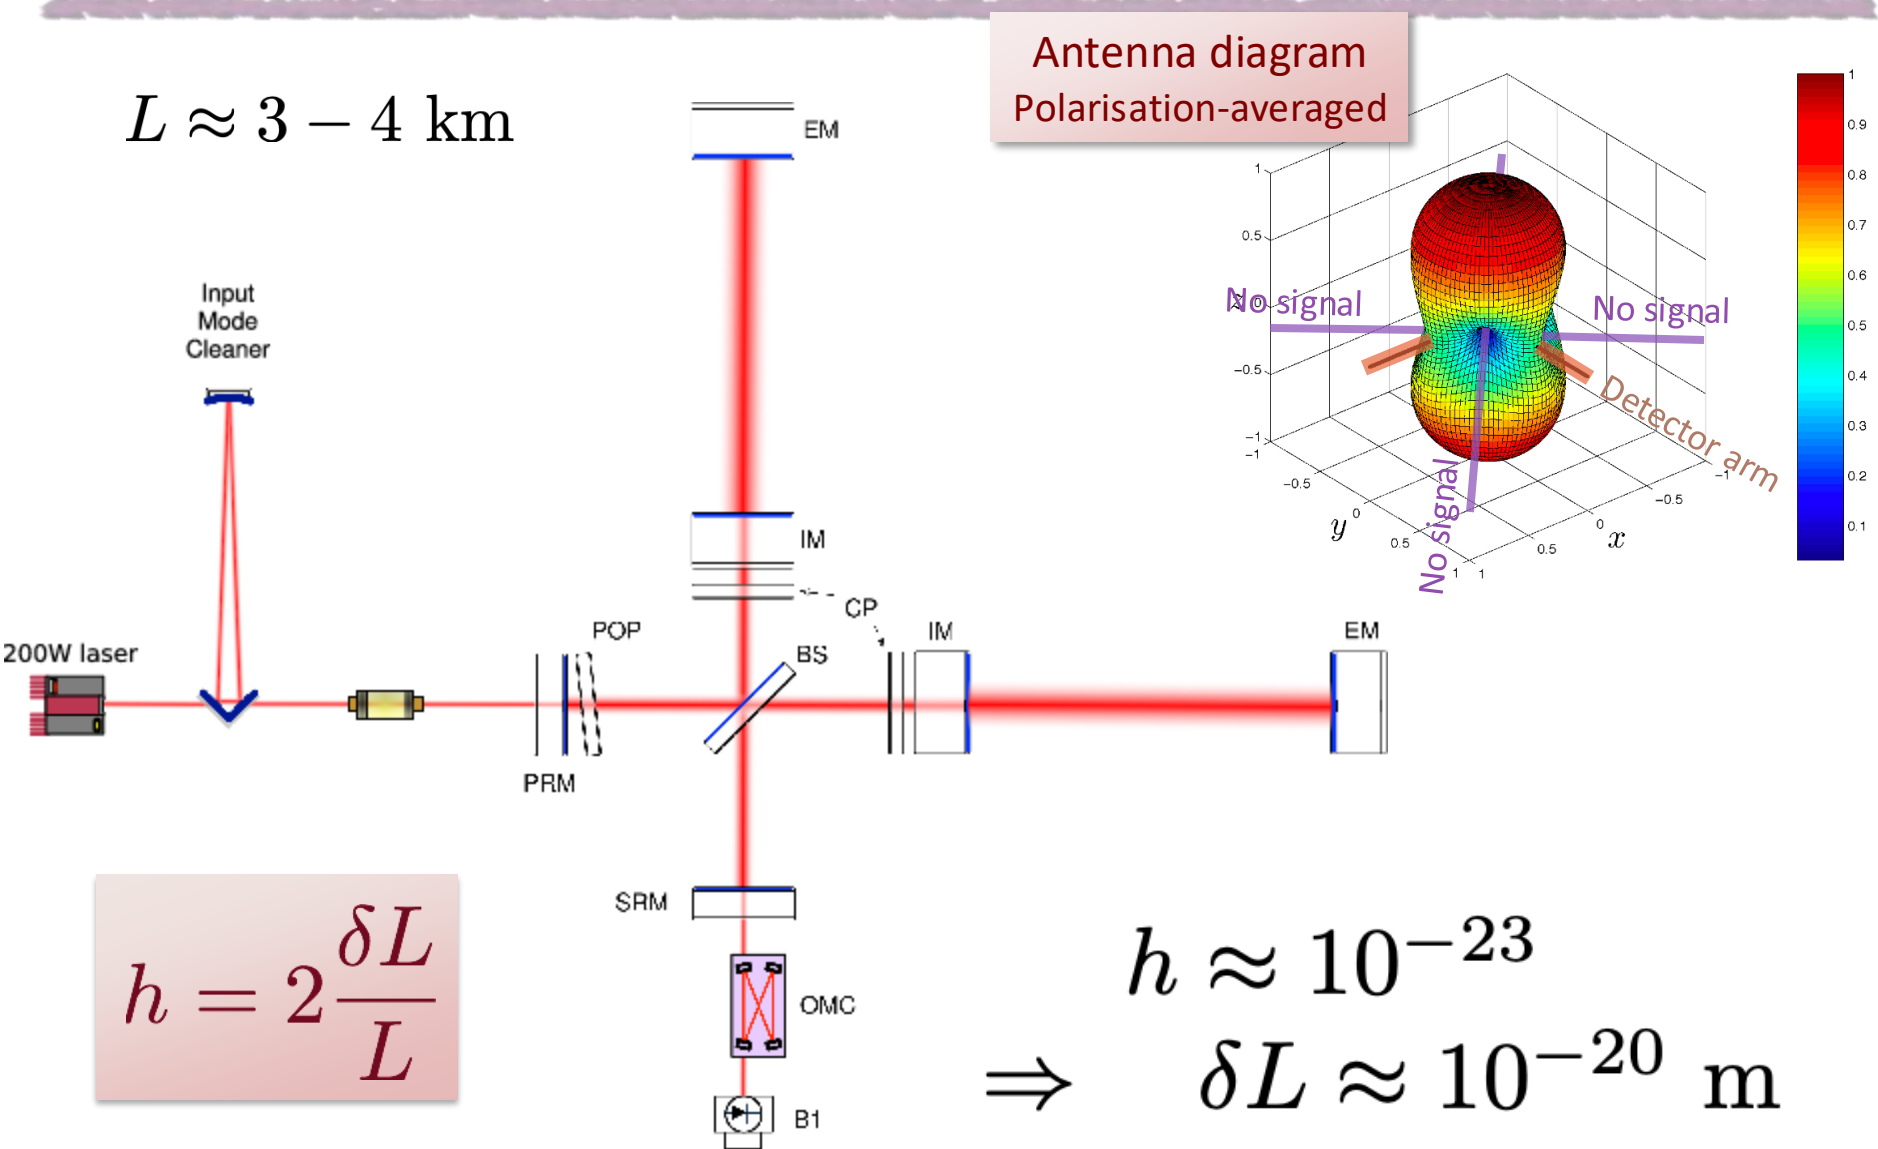

**Virgo** : ~800+ members  
129 institutions  
from 16 pays

**KAGRA** : ~400+ members  
110 institutions  
from 15 countries  
or regions

# Michelson interferometer : a “sensor” of gravitational waves

$$L \approx 3 - 4 \text{ km}$$

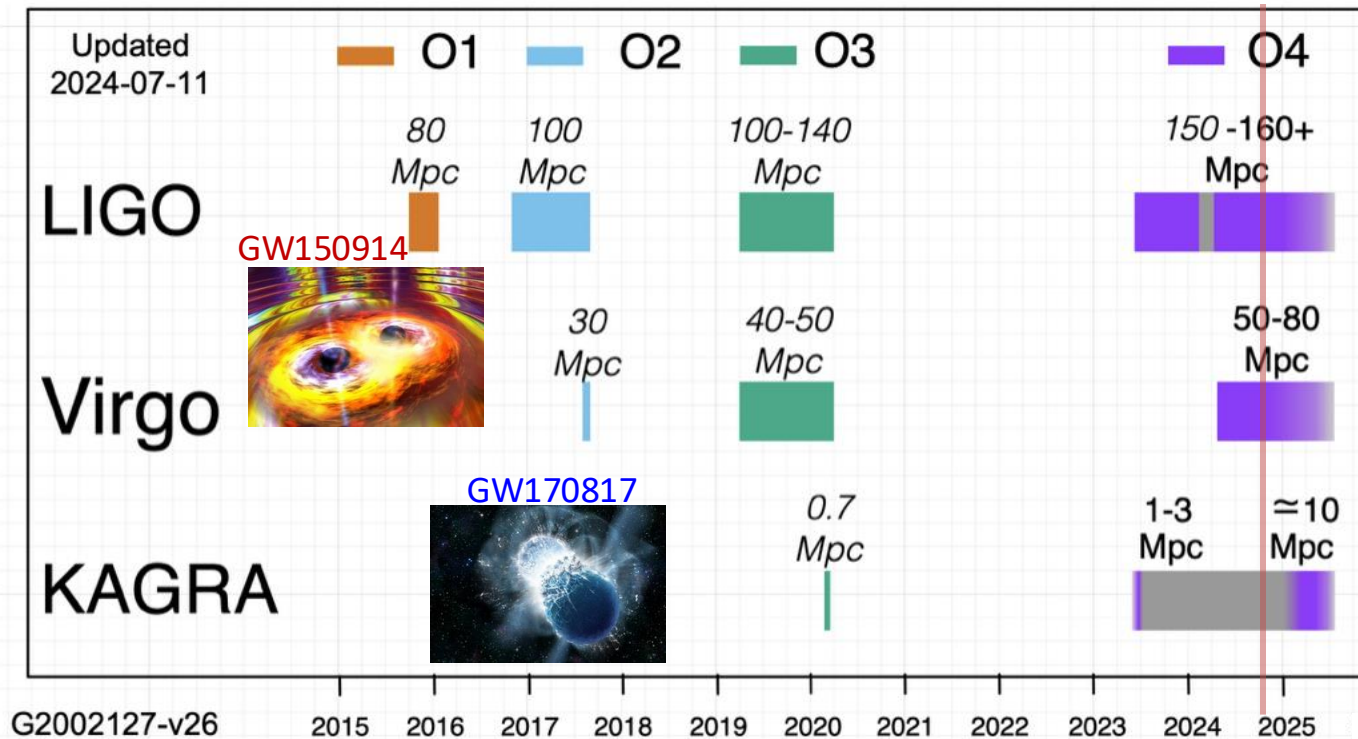

$$h = 2 \frac{\delta L}{L}$$

$$h \approx 10^{-23}$$

$$\Rightarrow \delta L \approx 10^{-20} \text{ m}$$

# LIGO-Virgo Observing Runs

<https://observing.docs.ligo.org/plan/>

- ▶ « Horizon » distance :
  - ▶ Distance at which a particular **reference event** emitted a signal which can be detected with Signal over Noise Ratio (SNR) = 8
  - ▶ **Reference event** = binary neutron star coalescence with  $1.4 M_{\odot}$  for each component

# The observed : compact binary coalescences

Following slides : loosely inspired by W. Del Pozzo, Fermi LAT Coll. Meeting, Pisa 2022

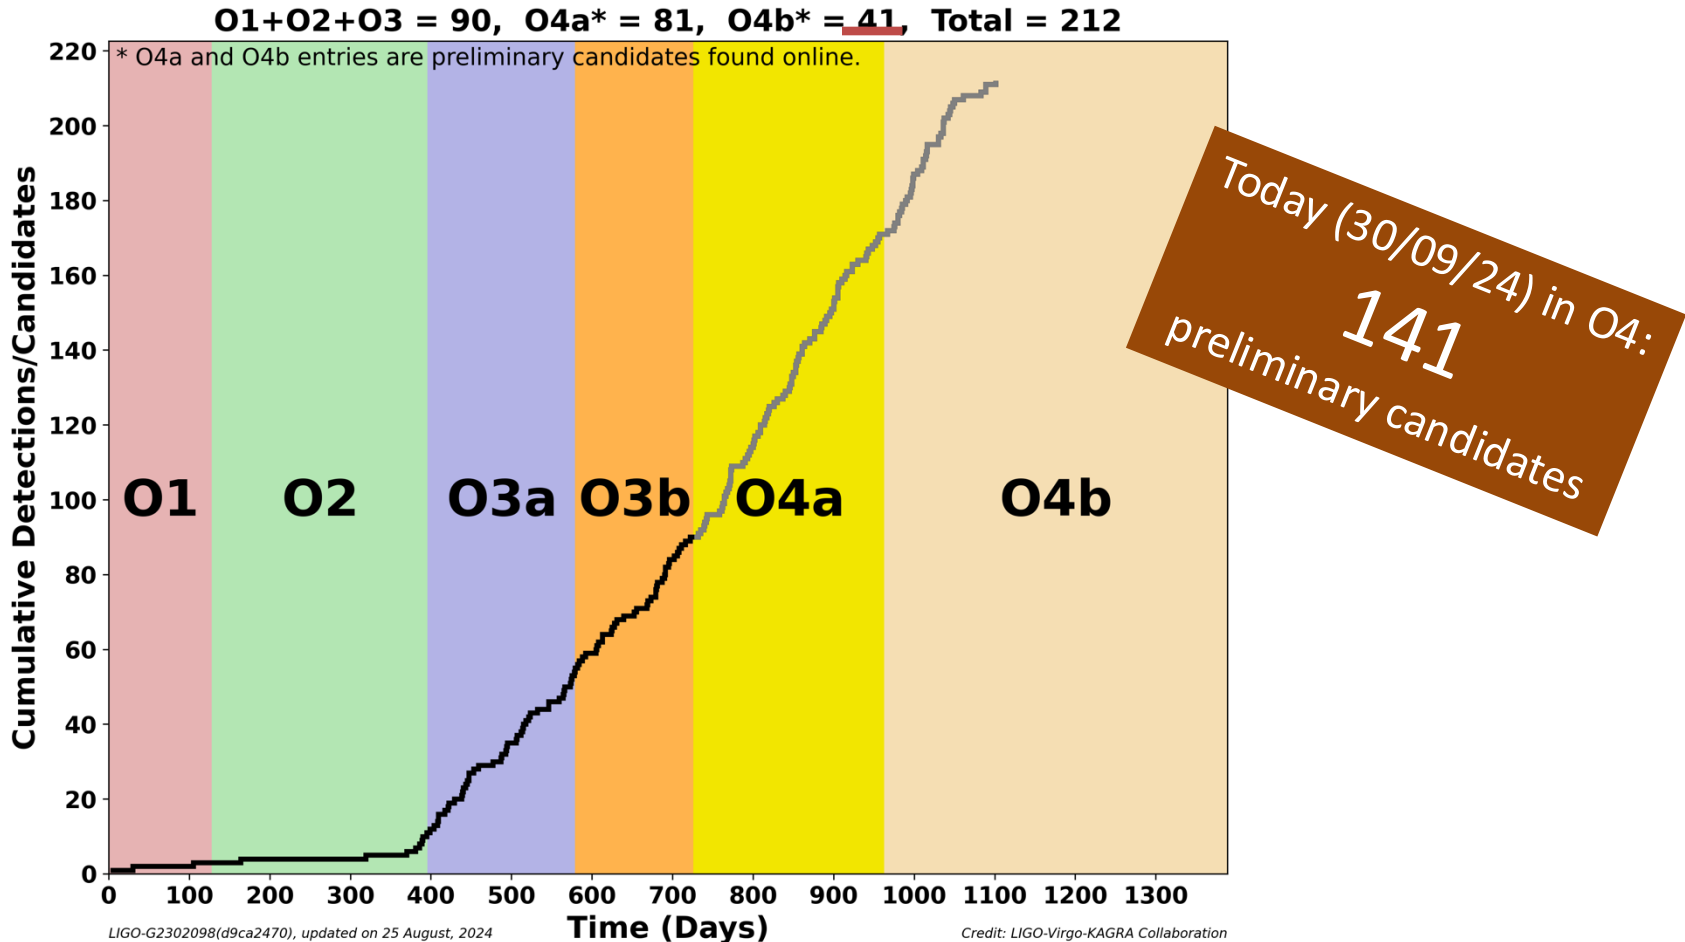

- ▶ Single observations allow studies on:
  - ▶ Binary dynamics and component nature
  - ▶ Non linear dynamics of space-time
  - ▶ Final object nature
  - ▶ Tests of GR

LVC, arXiv:1602.03837, Phys. Rev. Lett. 116, 061102 (2016)

# A path to astronomy

## ► Cumulative detections of binary coalescences

<https://gracedb.ligo.org/superevents/public/O4/>

# A few interesting events

ApJL 896 L44 (2020)

- GW190814's secondary and GW230529's primary are either heavy neutron stars or light black holes
- GW190521's remnant is an intermediate-mass black hole

# Astrophysics with GW

arXiv:2111.03634

## NS mass distribution

► What is the rate of (BBH, BNS, NSBH) mergers?

► How does it evolve with redshift?

► What does this tell us in terms of

- Stellar evolution?
- Binary formation?

Co-evolution in isolated binaries

Dynamical formation

► What is the mass distribution of the compact objects?

► What is the maximum NS mass?

► What is the minimum BH mass?

► Is there a gap between the two?

► What is the spin distribution of the compact objects?

Probe strong interaction in ultra-dense neutron-star matter

► Impact of tidal effects on inspiral will be measured for 100s of events in the future

# Cosmology and tests of GR with GW

## Measure the expansion rate of the Universe

- Compact binary coalescences are *standard sirens*
- Probe cosmological model

## Test General Relativity

### ▶ GW propagation

- ▶ Already tight constraints from GW170817 et al.
  - ▶ GW and light propagate at the same speed
  - ▶ GW and light are affected by background gravitational potentials in the same way

- ▶ Any sign of dispersion – waveform distortion due to different frequencies propagating at different speeds?

- ▶ Constrain hypothetical graviton mass!

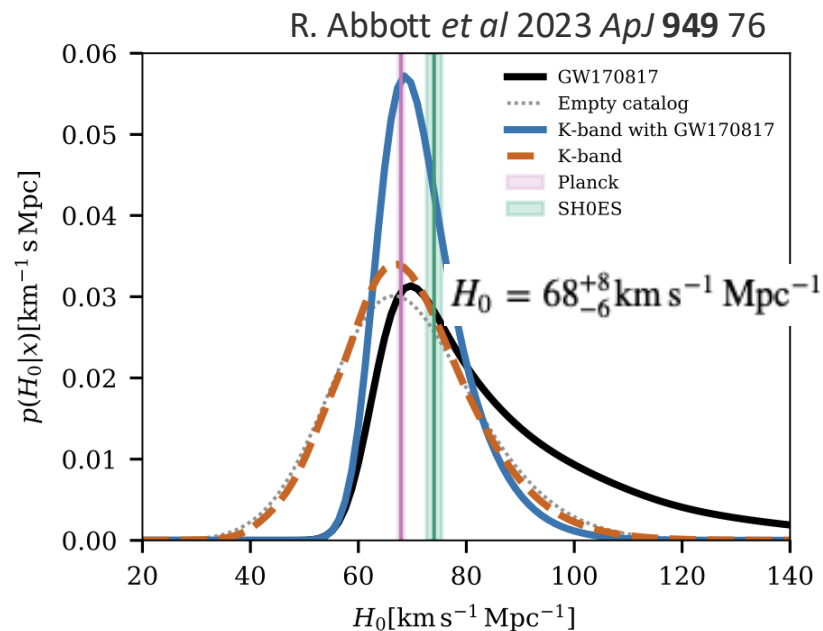

$$m_g \leq 1.27 \times 10^{-23} \text{ eV}/c^2$$

### ▶ GW polarization

- ▶ Are signals recorded in different detectors consistent with two tensor polarizations?

### ▶ Source dynamics

- ▶ Waveforms consistent with GR prediction?
- ▶ Test BH no-hair theorem via ringdown spectroscopy

# The (near) future for LVK

<https://observing.docs.ligo.org/plan/>

# The quasi-observed : Pulsar Timing Arrays

# Looking at many pulsars

# Ingredient : ToA and residuals

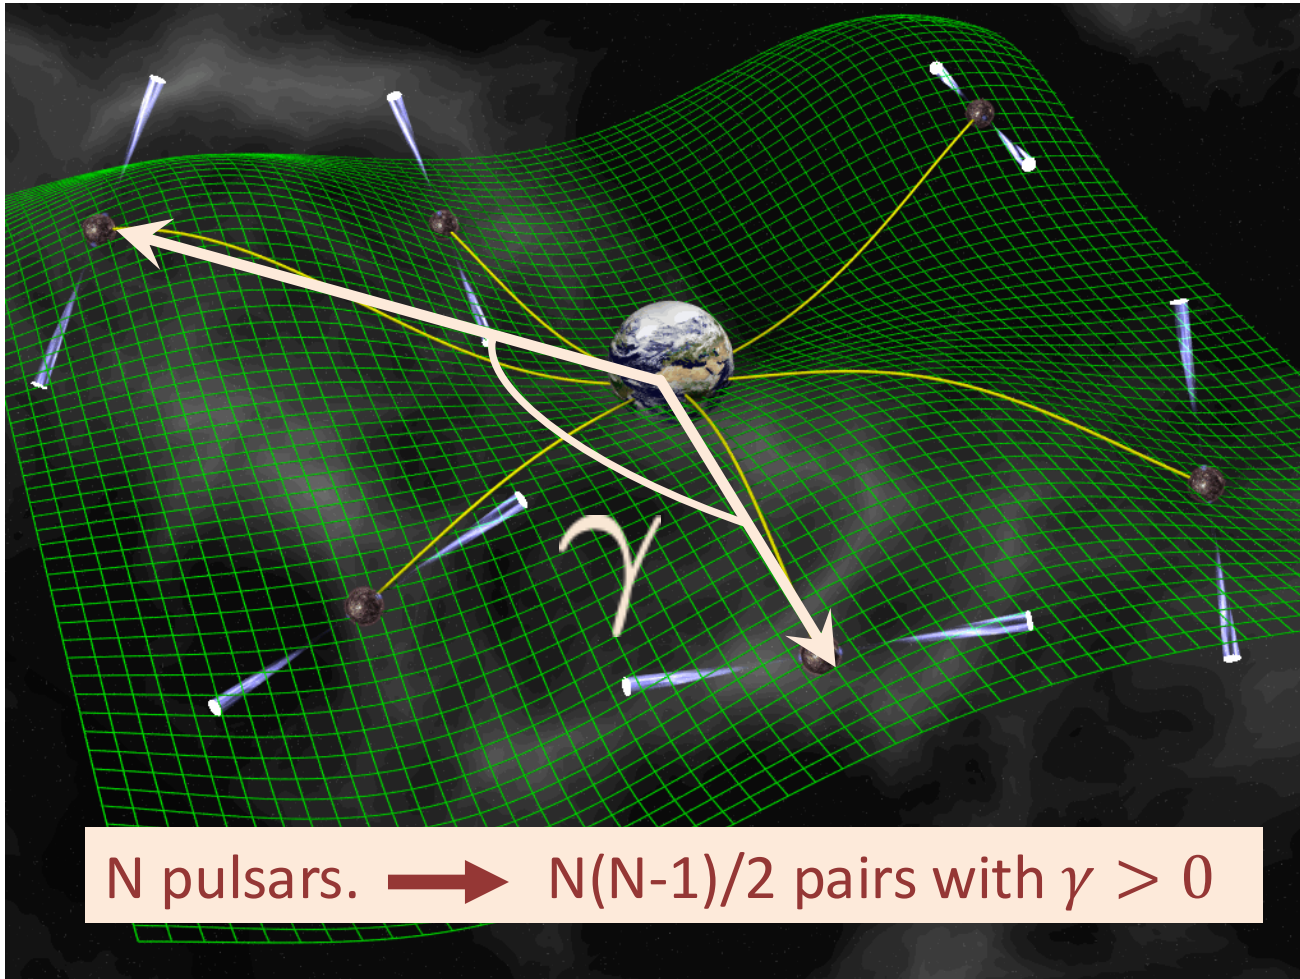

- ▶ Radio pulses -> ToA (time of arrival)
- ▶ Predict arrival time -> timing residuals

[credits: Mikel Falxa]

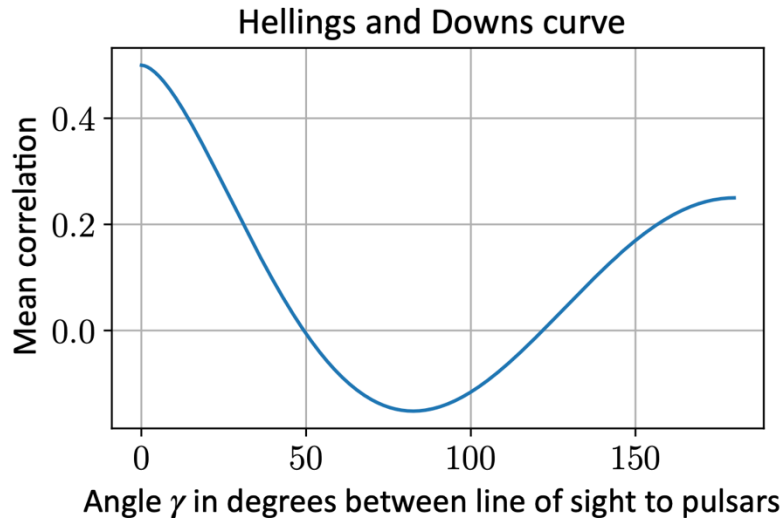

# Ingredient : Hellings and Downs

- ▶ Correlation of residuals between two pulsars

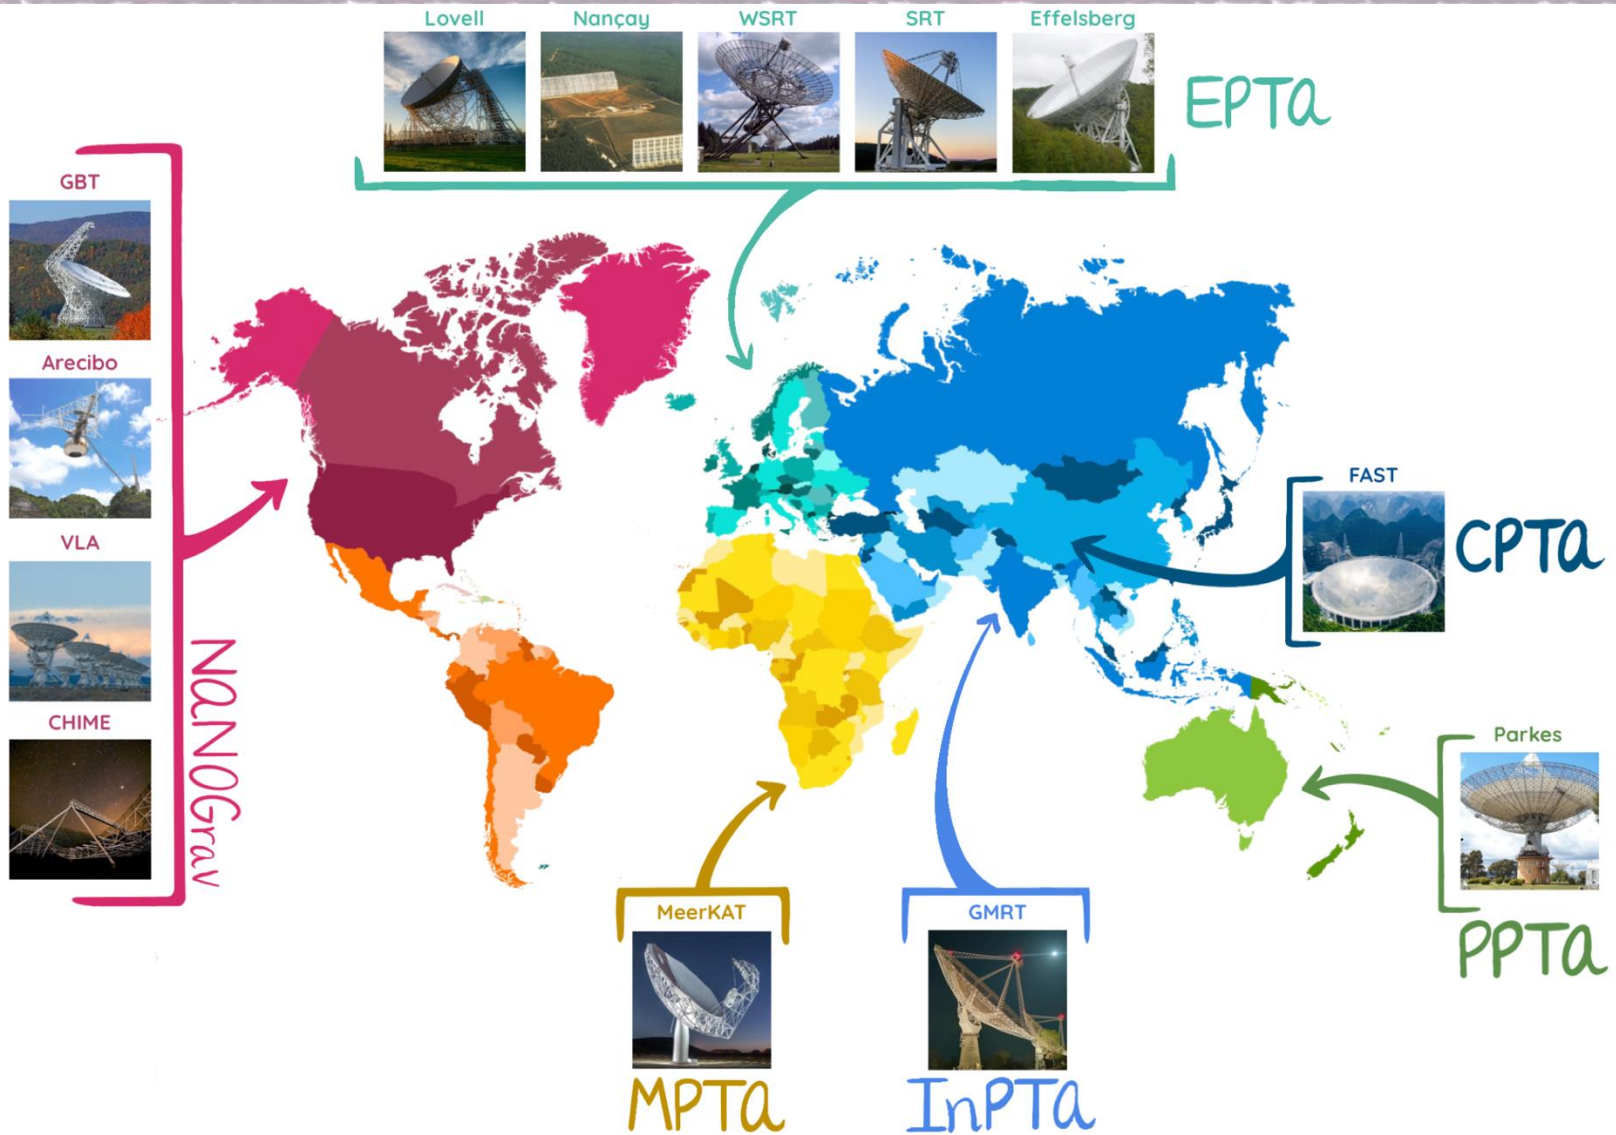

# Ingredient : Hellings and Downs

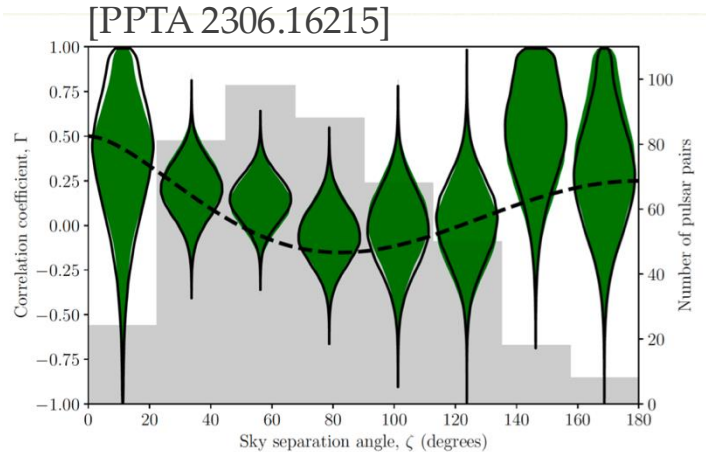

- ▶ Example : NANOGrav 15 years data
  - ▶ 67 pulsars => 2211 pulsar pairs
  - ▶ 15 angular bins =>  $2211/15 = 147$  pairs per bin on average
- ▶ Deviations from the H-D curve due to :
  - ▶ Measurement noise
  - ▶ Finite set of pulsars
  - ▶ Cosmic variance

# Various PTAs

# Individual results of various PTAs

**PPTA**

18 yrs, 30 pulsars,  $2\sigma$

**EPTA+InPTA**

14 yrs, 25 pulsars,  $3\sigma$

**NANOGrav**

15 yrs, 68 pulsars,  $3 - 4\sigma$

arXiv:2309.00693

# Interpretation

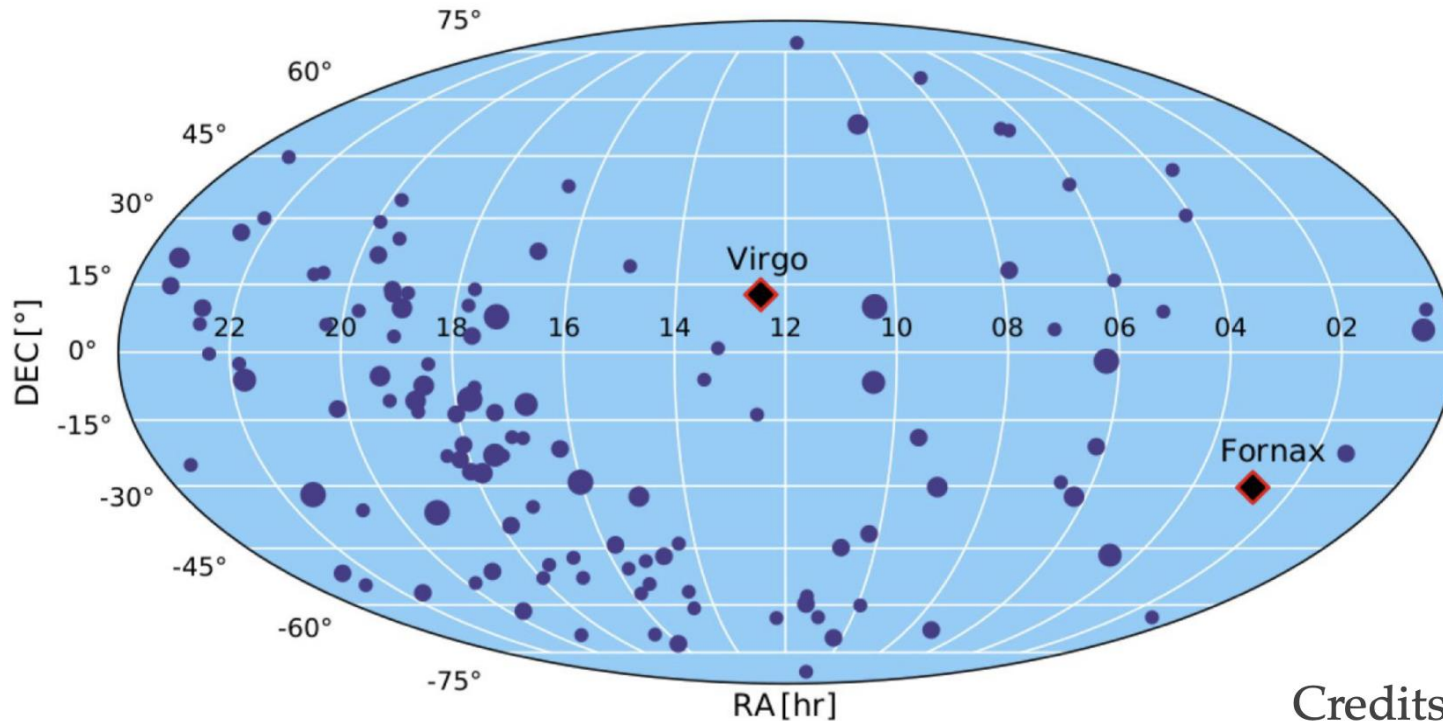

- ▶ Very difficult to interpret :
  - ▶ any quadrupolar perturbation that falls in the nHz band is good
- ▶ Stochastic gravitational waves background (SGWB)
- ▶ Could be :
  - ▶ GW signal from the population of super massive black hole binaries (SMBHB) in the local Universe ?
  - ▶ Network of cosmic strings ?
  - ▶ Superposition of continuous gravitational waves (CGW) ?
  - ▶ Due to inflation, phase transitions, primordial black holes... ?
  - ▶ Anything else ?

# Next : IPTA

- ▶ Yet to come :  
IPTA Data Release 3
- ▶ 121 pulsars  
« the biggest dataset ever made »

# The yet unobserved : dark matter searches

# Boson cloud superradiance

- ▶ Ultralight bosons
  - ▶ predicted under multiple theoretical frameworks
  - ▶ scalar or vector or massive tensor
  - ▶ Dark Matter candidates
- ▶ Can form clouds around rotating black holes
  - ▶ emit gravitational waves by a superradiance mechanism
  - ▶ quasi-continuous
  - ▶ short duration

Brito et al

# Boson cloud superradiance

- ▶ Ultralight bosons
  - ▶ produced by quantum fluctuations near the BH horizon
- ▶ Conditions for superradiant instability
  - ▶ Superradiance :  $\omega_V < m\Omega_{BH}$  ( $m = \text{azimuthal index}$ )
  - ▶ Confinement :  $\lambda_V \approx r_{BH}$
  - ▶ => boson field forms a resonant cavity
  - ▶ extracts energy from the rotation of the BH
  - ▶ cloud dissipates through gravitational wave emission
- ▶ Continuous Waves search methods

# Direct searches for ultralight bosonic dark matter

- ▶ **Dark photon** : massive vector exerting force on test masses.
  - ▶ Changes in lengths of cavities [1, 2, 3]
  - ▶ Composition-dependent force on different mirrors in KAGRA [4, 5]
- ▶ **Dilaton** : massive scalar exerting force on test masses.
  - ▶ Changes in lengths of cavities [6, 7]
  - ▶ Varying widths of mirrors [8, 9, 10]
- ▶ **Axion** : massive scalar particle modulating polarization of laser light [11, 12]
- ▶ Searched with Continuous Waves techniques

# Summary

---

- ▶ Extremely successful three observing runs of LIGO / Virgo
  - ▶ ~ 200 BBH, 2 NS-BH, 2 BNS
  - ▶ Insights on gravity, black holes, cosmology, nuclear physics,...
- ▶ GW170817 BNS event was a fundamental milestone... and still is
- ▶ O4 run ongoing
  - ▶ A few (2-5) BBH detections per week
  - ▶ No other multimessenger observation... yet
- ▶ Searching for other GW signals
  - ▶ (quasi-)Continuous Waves from rotating neutron stars or other sources
  - ▶ SGWB with LIGO-Virgo-Kagra and various PTAs
- ▶ Searching for some dark matter particles

# Spares

# BNS systems

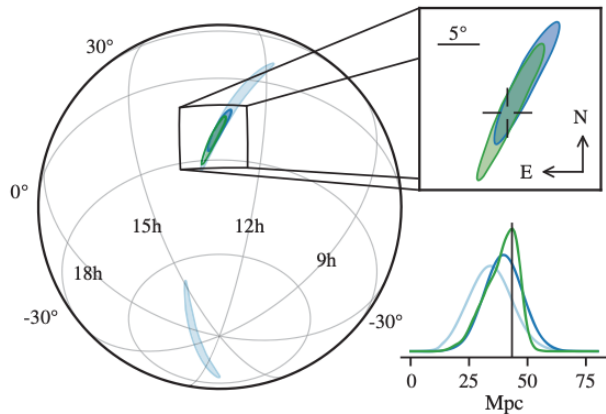

## ► GW170817

## ► GW190425

arXiv:1710.05832, PRL 119, 161101 (2017)

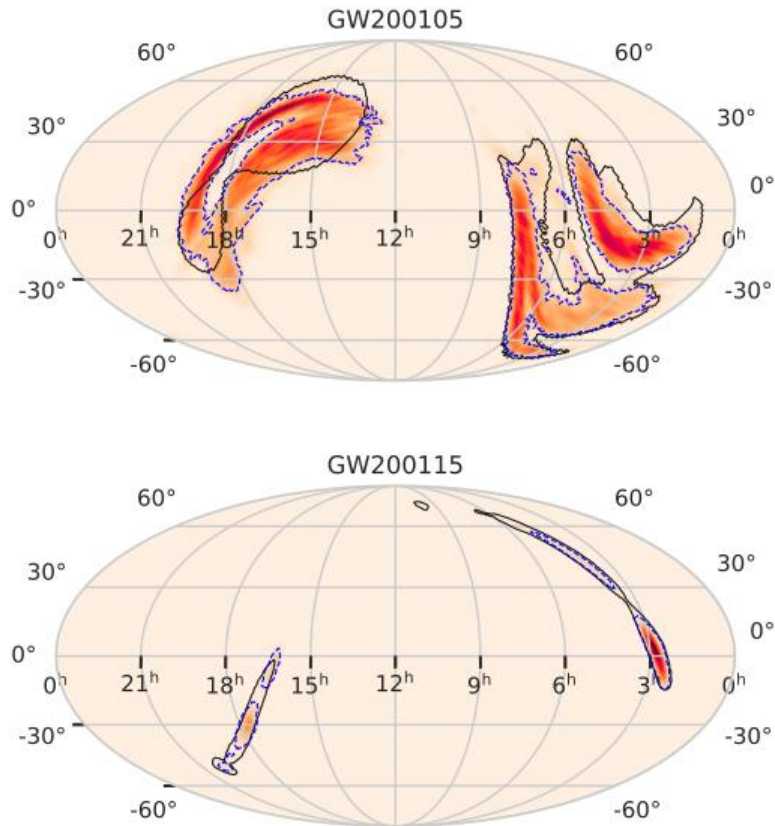

arXiv:2001.01761, ApJ Letters, 892:L3 (24pp), 2020 March 20

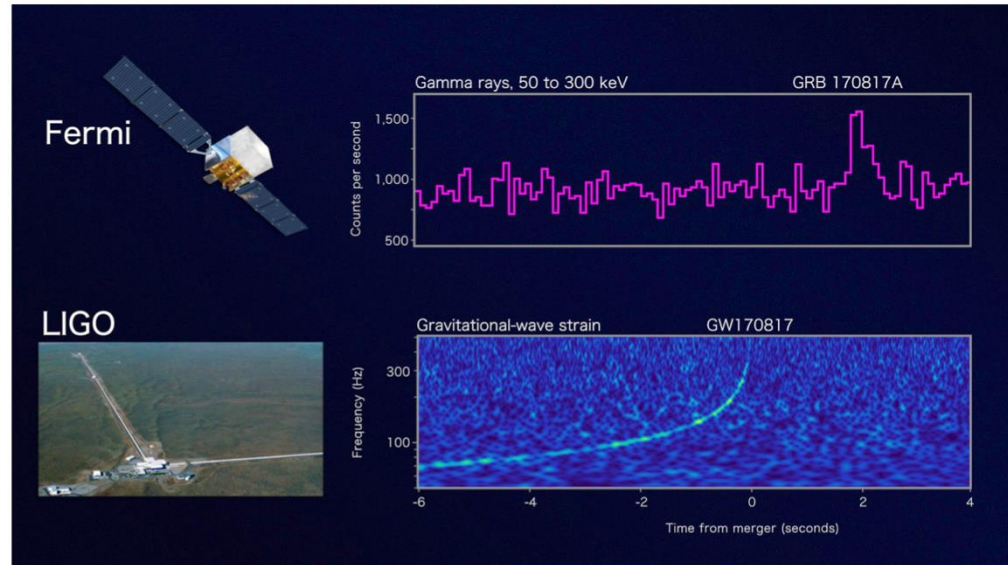

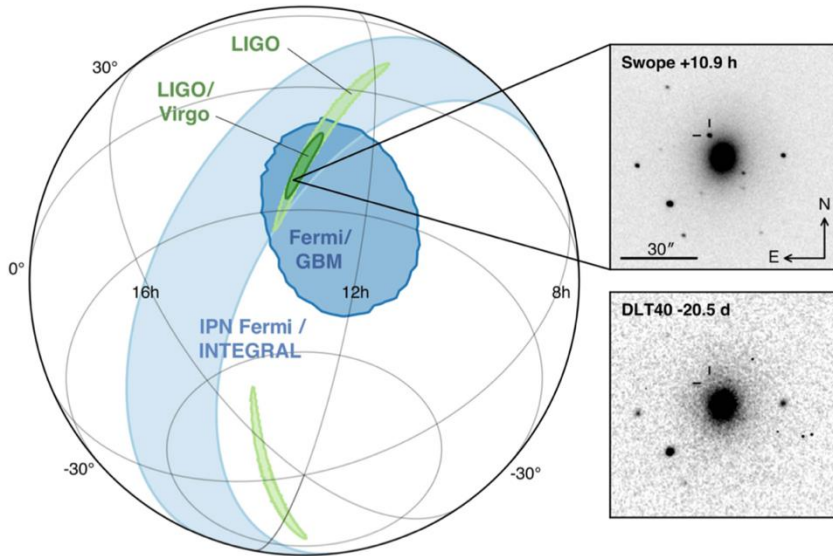

# Two NS-BH binaries

- ▶ Two events
- ▶ Poor localization

- ▶ Spins loosely constrained

# First BNS system : GW170817

- ▶ Coincident short GRB
- ▶ First direct evidence  
some BNS mergers  $\Leftrightarrow$  progenitors of short GRBs

# A curious event : GW190814

- ▶ Primary mass :  $m_1 \sim 23 M_\odot$
- ▶ Secondary mass :  $m_2 \sim 2.6 M_\odot$
- ▶ Sec. mass in the hypothesized mass gap  $2.5 - 5 M_\odot$
- ▶ New low mass BH population ?
- ▶ Extreme NS population ?
  - ▶ Exotic object ?
  - ▶ Equation of state ?

arXiv:2006.12611, ApJL 896 L44

# The heaviest : GW190521

arXiv:2009.01075

- ▶ Merger  $\Rightarrow m_1(85 M_{\odot}) + m_2(66 M_{\odot}) \rightarrow m_f(145 M_{\odot})$
- ▶ Studies :
  - ▶ Possible eccentricity ? (e.g. Iglesias et al, arXiv:2208.01766)
  - ▶ Possible dynamical capture ? (Gamba et al, arXiv:2106.05575)?

# GW170817 : EM counterpart

- ▶ Observed optical/UV/infrared counterpart
  - ▶ Origin : NGC4993 galaxy
  - ▶ Kilonova (arXiv:1710.05833, ApJ Letters, 848:L12 (59pp), 2017 October 20)
  - ▶ Speed of GW (arXiv:1710.05834, ApJ Letters, 848:L13 (27pp), 2017 October 20)

$$-3 \times 10^{-15} \leq \frac{\Delta v}{v_{EM}} \leq +7 \times 10^{-16}$$

$$\Delta v = v_{GW} - v_{EM}$$

- ▶ Other outcomes :
  - ▶ EoS constraints
  - ▶ Jet morphology
- ▶ Cosmology :  $H_0$ 
  - ▶ NGC4993 spectroscopic redshift
  - ▶ Cosmic-ladder-Independent  $H_0$  measurement

$$H_0 = 70_{-8}^{+12} \text{ km s}^{-1} \text{ Mpc}^{-1}$$

arXiv:1710.05835, LVC, *Nature* **551**, 85–88 (2017)

# Testing GR

- ▶ Test consistency of predictions vs data
  - ▶ residuals (when wavef. removed from data)
  - ▶ checks of GW emission model
    - ▶ using different portions of waveforms (inspiral / merger / ringdown)
  - ▶ Remnant properties
  - ▶ GW propagation (testing beyond GR)
  
- ▶ No evidence of non-GR physics

arXiv:2112.06861

# Expected rates and localization

▶  $R_D$  (= detection rate)  $\propto d$  (= range)<sup>3</sup>

▶ Example :

$$d : 100 \text{ Mpc} \rightarrow 160 \text{ Mpc} \quad \Rightarrow \quad R_D \times 4$$

▶ For O4

Rates

- ▶  $O(100)$  BBH detections / year
- ▶  $O(1 - 10)$  BNS detections / year
- ▶ Counterparts for BNS  
highly uncertain  
(arXiv:2204.12504)

Localization

# Neutron stars: internal structure

## ► Density

# Neutron stars: internal structure

## ► Equation(s) of state

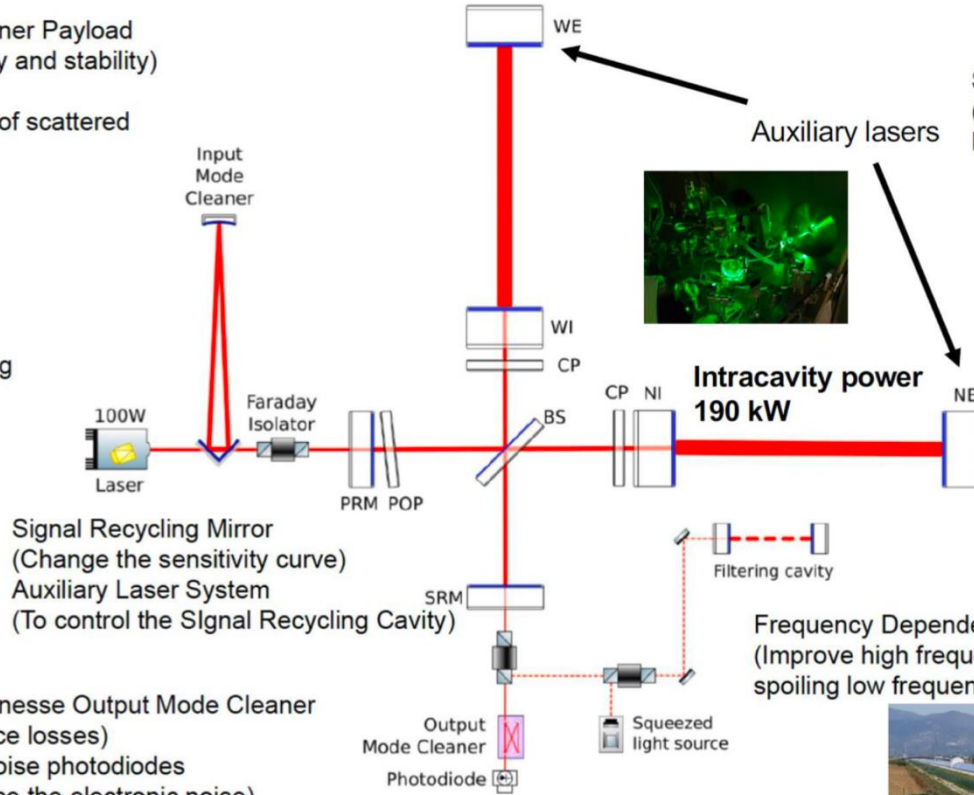

# Advanced Virgo+

Path towards O4: reduce quantum noise, hit against thermal noise.
