

Low intensity beam diagnostics at INFN - LNS

L. Cosentino

INFN - Laboratori Nazionali del Sud

EURISOL-NET (ENSAR/NA03) Working Group

Accelerators at LNS

Superconducting Cyclotron
<80MeV/amu

Tandem 15MV

EXCYT facility: ISOL radioactive ion beams

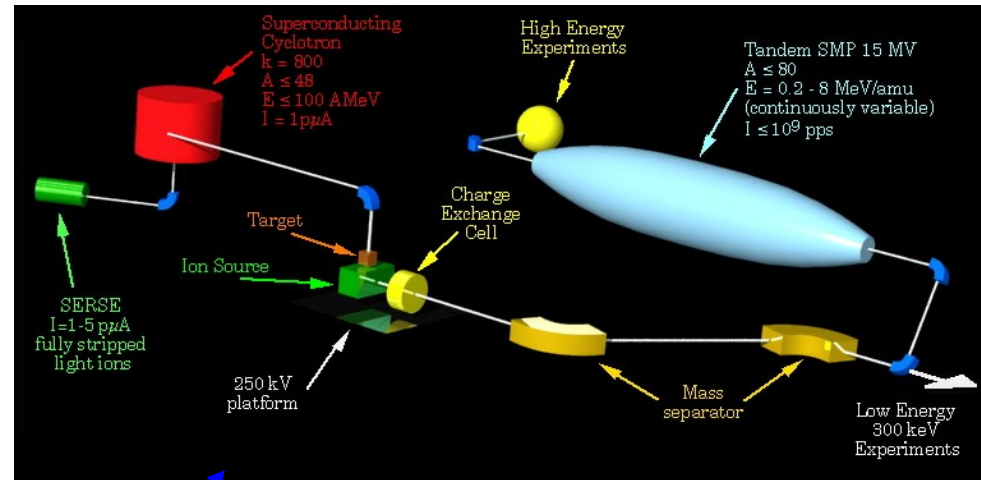

FRIBs: in-flight fragment separator

Energy ranges: 10keV ÷ 300keV
Tandem energy

RIBs at the Cyclotron energy

LNS layout : the Excyt facility

EXCYT diagnostics

Very low energy/low intensity beams

The ordinary electromagnetic techniques approach their **intrinsic limitations**, mainly due to:

- electronic noise
- triboelectric noise
- signal contamination due to secondary electron emission

Low S/N ratio

Available techniques

- Gas detectors
- Diamond
- Others: Cherenkov, etc.

Possible solutions

- increase the sensitivity
 - reduce noise by better design and shielding (can be complex and expensive)
- increase the signal
 - a possible way to increase the signal is to use **particle detectors**: they are sensitive to the energy released by each particle of the beam

in use at LNS

Low energy beam Imaging with CsI

beam imaging: CsI(Tl) scintillating plate with CCD video camera

beam diagnostics of very low-energy and low-intensity ion beams from the Tandem injector at LNS

CsI(Tl) is an insulator and gets charged-up

We wound it with a grounded conductor wire

Diagnostics for Low Energy RIBs

LEBI: Low Energy Beam Imager / Identifier

three different heights

- Imaging of Stable (pilot) beams
- Imaging of radioactive beams
- Beam rate measurement
- Decay curve reconstruction

LEBI is our solution for diagnostics of low energy radioactive beams.

NIM A 479 (2002) 243

NIM A 622 (2010) 512

Diagnostics for Low Energy RIBs

Three working positions

radioactive beam imaging

stable beam imaging

beam counting/identification

LEBI

Low Energy Beam Imager/Identifier

${}^7\text{Li}$ $I = 10 \text{ pA}$ $E = 10 \text{ keV}$

energy range
 $10 \text{ keV} \div 300 \text{ keV}$

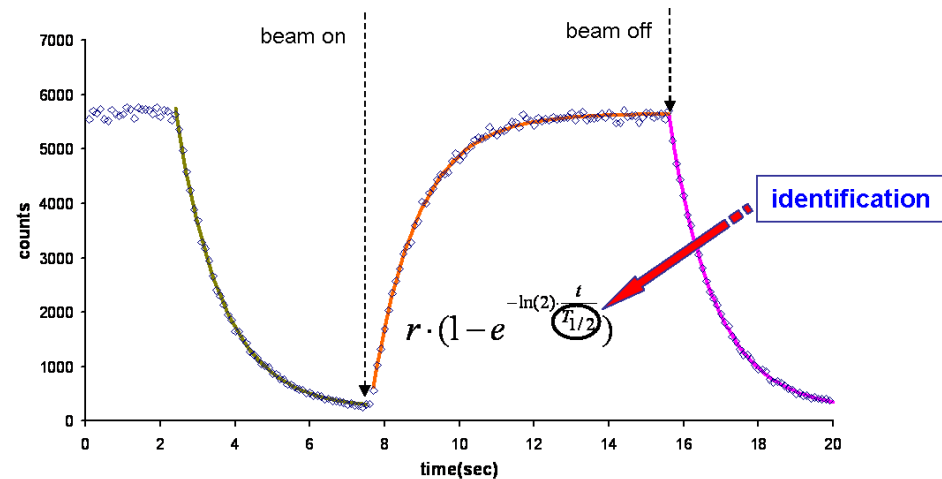

Sensitivity for beam imaging

- $E_{\text{threshold}} = 5 \text{ keV}$
- $I_{\text{stable beam}} \sim 10^4 \text{ pps/mm}^2$
- $I_{\text{radioactive beam}} \sim 10^3 \text{ pps/mm}^2$
- **resolution < 1mm**

${}^8\text{Li}$ $I = 100 \text{ fA}$ $E = 10 \text{ keV}$

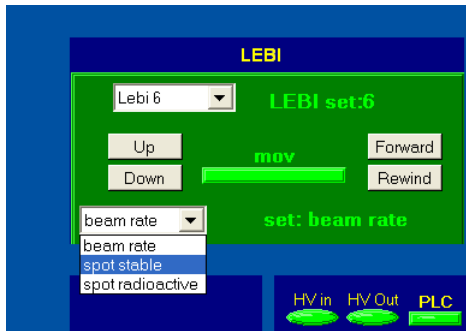

decay curve of β particles

radioactive beam

10 LEBI working along the EXCYT beam line

- LEBI Low Energy Beam Identifier
- FC Faraday Cup
- Segmented Metal Plate
- quadrupole
- steerer
- multipole
- accelerator column
- surface coils
- shielding wall

First and Second stage of the isobaric mass separator

To second stage separator

LEBI

CEC

LEBI

LEBI

Second stage exit

Elements of LEBI

The scintillator screen is placed at 45° respect to the beam axis.

CCD camera

ccd camera watec 902H

- sensitivity 10^{-4} lux
- **spatial calibration**
- reference of the beam axis

EXCYT transmission factors

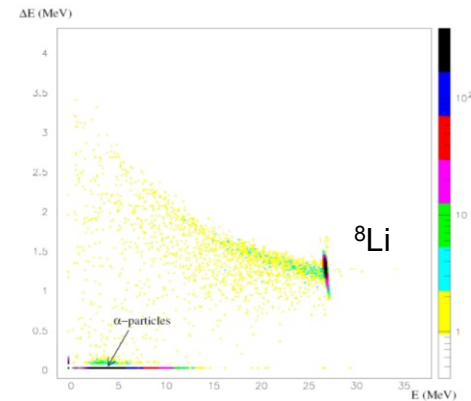

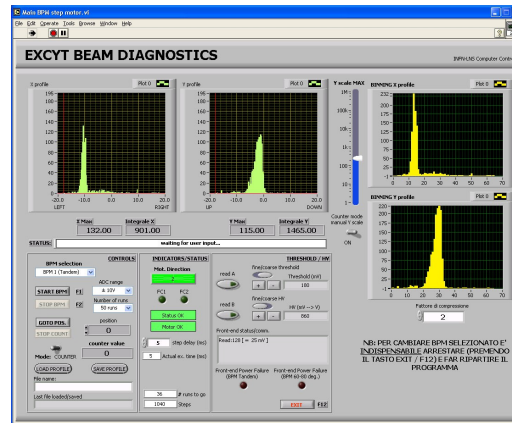

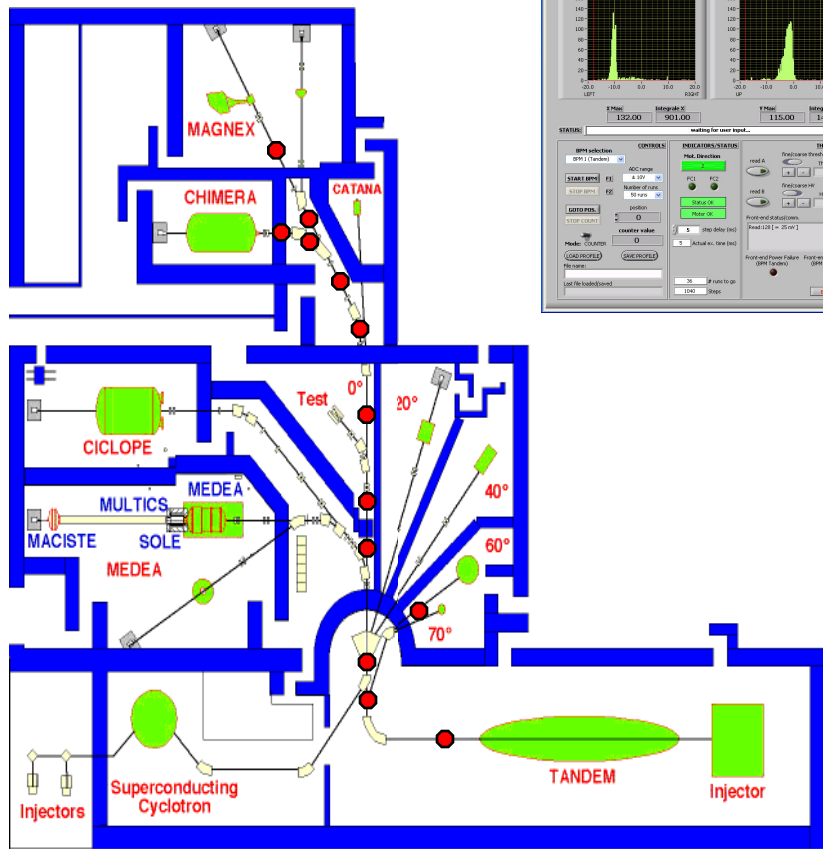

October 2008

Primary beam power	LEBI1 (pps) ${}^8\text{Li}^+$	CEC (10 keV) ${}^8\text{Li}^-$	Through platforms ${}^8\text{Li}^-$	Through 2 nd stage	Tandem entrance	Through Tandem @7MV	On target ${}^8\text{Li}^{3+}$

Diagnostics for accelerated (Tandem) RIBs

Low intensity diagnostics (sensitivity down the single particle, upgraded during 2010 for providing the long beam lines (Magnex and Chimera)

Diagnostics for accelerated (Tandem) RIBs

Plastic scintillators for beam intensity measurements

Position sensitive silicon detectors

- 2D beam profile monitor
- **beam energy spectra**
- identification of the beam particles ($\Delta E - E$)

Beam profile monitor (FIBBS)
based on a pair of scintillating fibres
scanning the beam

Beam counting

Intensity below 10^6 pps

Plastic scintillator (BC408) optically coupled to a small PMT, working in pulse counting mode

A screenshot of the 'Beam diagnostics' software interface. The window title is 'Beam diagnostics'. On the left, there is a vertical list of 18 channels, each with a label and 'Up/Dwn' buttons. The labels are: T S1 mov, T PH1 mov, T PH2 mov, T S2 mov, Z S1 mov, Z S2 mov, Z PH1 mov, Z PH2 mov, Z S3 mov, Z PH3 mov, ND S1 mov, ND PH1 mov, ND PH2 mov, ND S2 mov, ND PH3 mov, MX PH1 mov, MX S1 mov, MX S2 mov, and MX PH2 mov. On the right, the 'BEAM DIAGNOSTICS' section is active. It shows 'Sel: ExcytHighEnergy' in a yellow box, a dropdown menu set to 'ExcytHighEnergy', and a 'T PH1' display showing '0 Hz'. Below this, there are 'Treshold' and 'HV' controls, both set to '0' with '0 mV' and '0 V' respectively. There are also 'PMT status' and 'Multiplexer' indicators, both showing green circles. The interface is blue with red and yellow highlights.

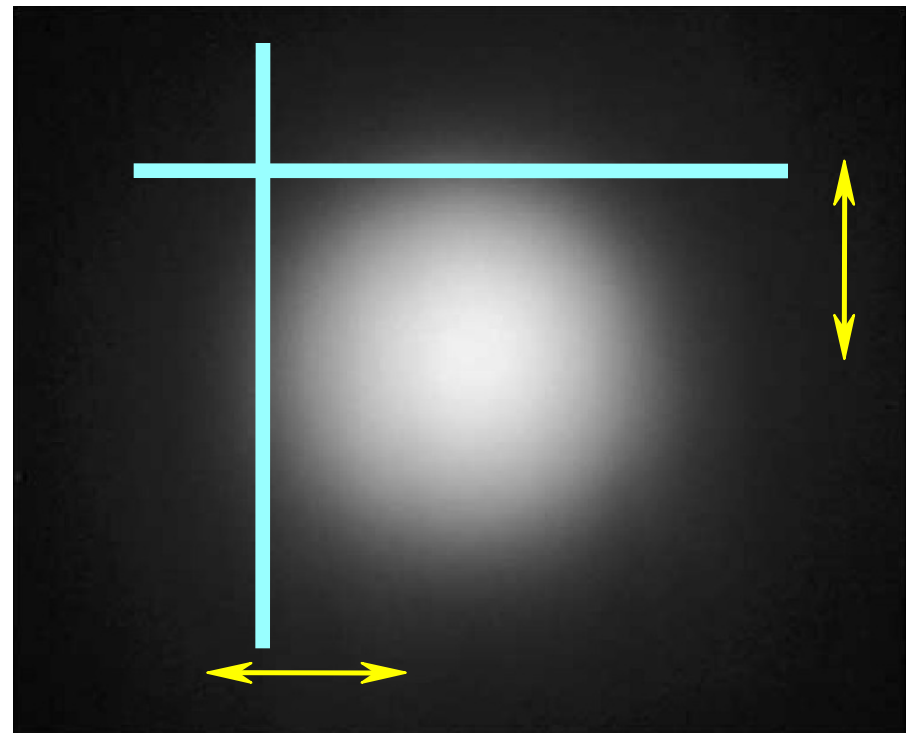

1D beam scanning

This technique consists of scanning a beam with scintillating fibres, in order to produce the 1D intensity distribution

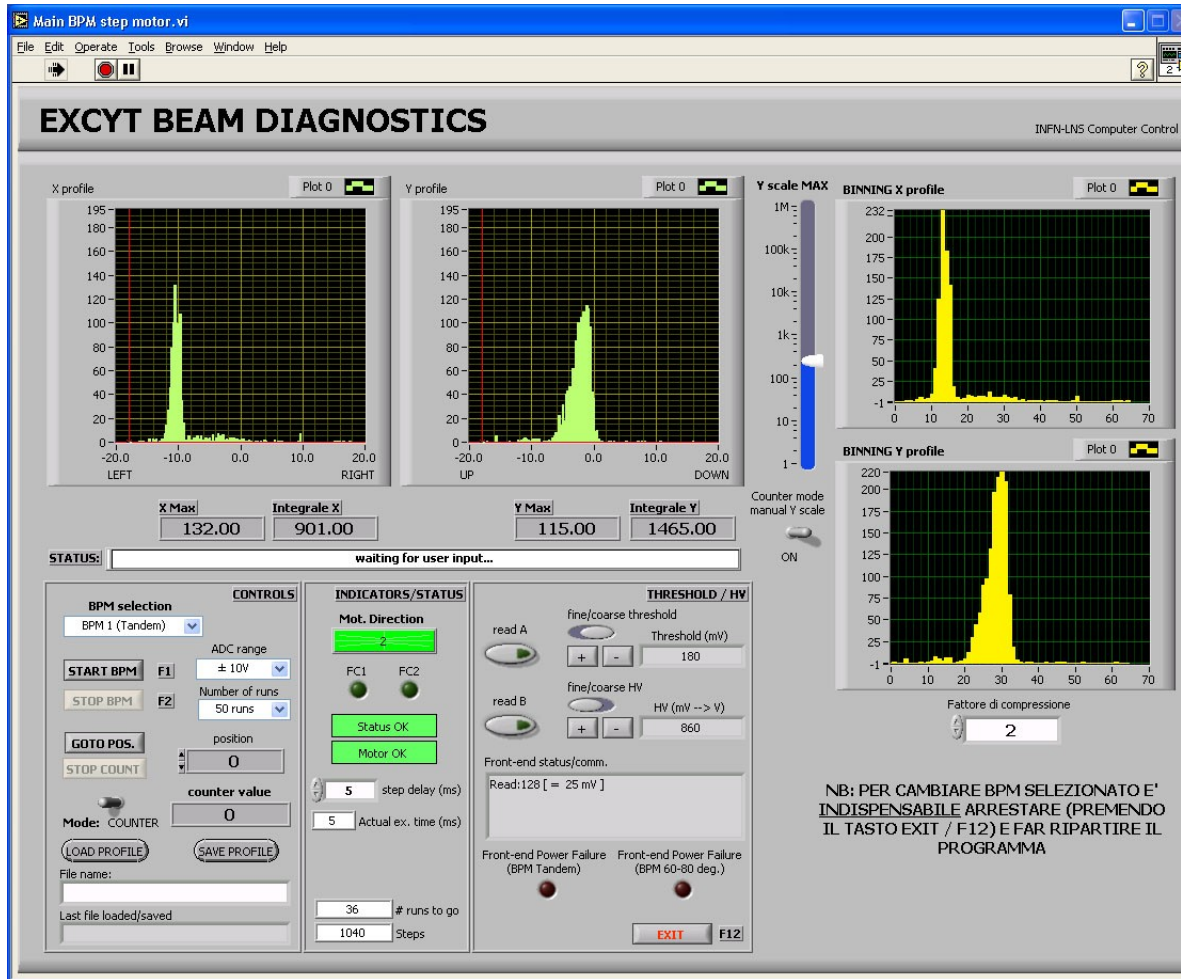

Light collection efficiency at one end: $\approx 3.5\%$

- Light yield is of the order of 10000 photons/MeV. For charged particles is lower (quenching).
- Plastic scintillating fibre: **fast** (3ns), not rad-hard, $L_{at} \approx 3.5\text{m}$, $\lambda \approx 435\text{nm}$
- Tb-glass scintillating fibre: **slow** (4ms), rad-hard, $L_{at} \approx 10\text{cm}$, $\lambda \approx 550\text{nm}$
- Ce-glass scintillating fibre: **fast** (40ns), not rad-hard, $L_{at} \approx 2\text{cm}$, $\lambda \approx 400\text{nm}$

FIBBS (Fibre Based Beam Sensor)

Fibres diameter: 300 ÷ 500 μm

Glass fibres for intensity over 10^6 pps

Plastic fibres for lower intensity

Position sensitive silicon detector

position sensitive silicon telescope for RIB identification and profiling

- 2D beam profile monitor
- beam energy spectrum
- identification of the beam particles ($\Delta E - E$)
- read-out from the back and the 4 corners
- charge division algorithm for position evaluation

5cm x 5cm Si detector

multi-hole mask

reconstruction of the hole mask put in front of the detector for calibration

Position Sensitive Silicon Detector

Real time beam imaging. Fast acquisition system based on VME modules

particle position reconstructed by 4 signals from the PSSD corners. Spatial resolution 1 – 2 mm

The beam intensity must be kept below 10^4 pps

Silicon telescope

telescope for RIB identification

- signal due to energy loss: Bethe & Bloch...
- average energy to produce an e/h pair: 3.62 eV
- radiation hardness /cost: low
- ease-of-use & reliability: sufficient
- suitable for specific applications

- thickness $\approx 50 + 500 \mu\text{m}$
- unambiguous identification of isotopes by elastic scattering
- at low beam intensity can be used directly on the beam
- intensity measurement by means of counting rate
- cost: reasonable

Ions Tagging with Time Of Flight

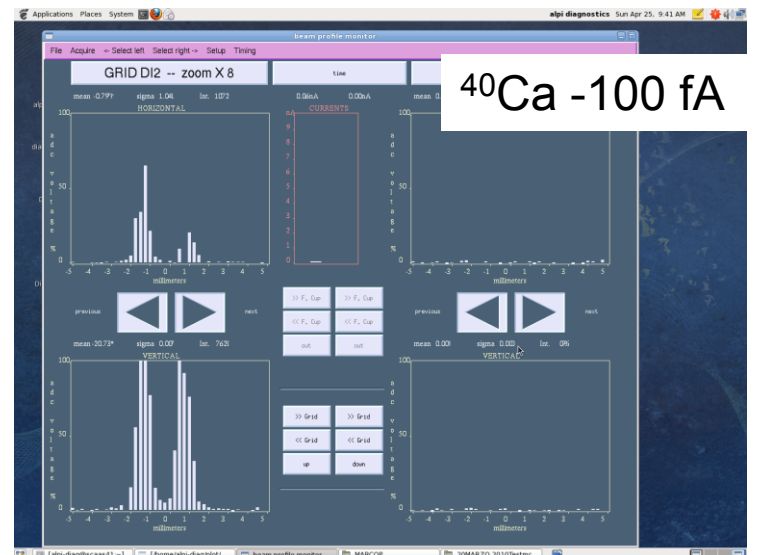

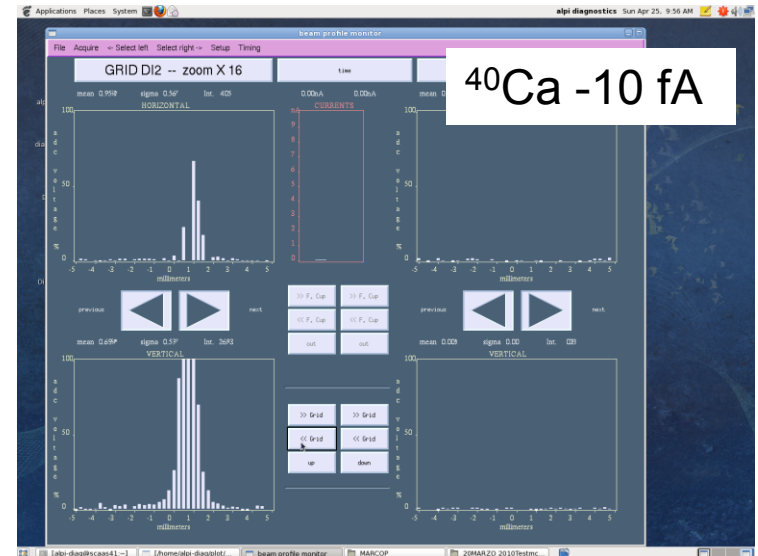

➤ On-line discrimination between ions having same energy but different mass.

1D Beam profile monitor based on MCP for SPES

System developed in Legnaro LNL, based on a MCP placed directly on the beam line, with a position sensitive anode. Less than 10^5 pps/cm² measured profile sensitivity.

Wire step = 0.75 mm

MCP for beam imaging

2D-imaging secondary emission detectors

built and tested at LNS

MCP for beam imaging

The technique is appealing but unfortunately the devices are quite delicate and expensive

MCP for beam imaging

LNS in the DITANET european network

New diagnostics challenge

Diagnostic Techniques for future particle Accelerators NETwork

antiproton beam diagnostics at FAIR?

*high performance photcamera
Chroma CX3 14-bit cooled CCD*

screen = CsI (TI)

beam = protons

$E = 200\text{keV}$

$I \approx 2.5\text{fA}$ (10^4 pps)

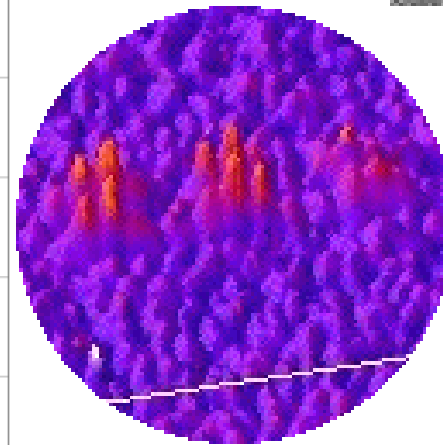

$t_{\text{exposure}} = 20\text{s}$

LNS in the DITANET european network

screen = CsI
beam = protons
E = 50keV
I \approx not measurable
 $t_{\text{exposure}} = 60\text{s}$

toward single particle imaging....!!!

beam attenuated through a fine mesh, pitch $\approx 0.1\text{mm}$

Conclusions

- **several different technologies tested/employed at LNS for L.E.L.I. ion beams**
- **in general each specific problem needs a specific solution**
- **scintillators are a tradeoff solution between robustness, ease-of-use, and cost**
- **CsI(Tl), doped glass, and plastics (in some cases) offer good performance**
- **R&D activity is going towards the development of diagnostic devices for the SPES facility.**

How to improve the sensitivity: the MCP

What is a MicroChannel Plate?

it is a mesh of **photocathodic microchannels**
each channel is a microscopic continuous electron multiplier
operated at **high voltage (up to 5000V)**, in **high vacuum**
rather **delicate** and quite **expensive**
sensitive to **photons, electrons, ions**
best timing (even below 100ps)

profile measurement

Spiral 2 beam imaging

- Emissive Foil Monitor

Principle : secondary emission on Al foil, amplification by microchannel plates, reading informations on X-Y matrix

Energy range : up to 10 KeV

Intensity range : from 10 pps to 10^9 pps

Location lines : from 1+ line to GANIL Experimental rooms

Gamma ray spectroscopy with two germanium detectors

Tagging and tracking

Scintillators

- signal due to energy loss with emission of scintillation photons
- average energy to produce a photon $\approx 10\text{-}100$ eV (gamma and electrons)
- average energy to produce a photon $\approx 100\text{-}1000$ eV (ions)
- radiation hardness /cost: sufficient for plastics, excellent for inorganic scintillators
- ease-of-use & reliability: excellent

- organic scintillators (plastics: NE110, NExxx, BC404, BC408, BCxxx, fibres, etc.)
- inorganic crystals (CsI, BaF, YAG, YAP, LSO, LYSO, LaBr, etc.)
- doped glasses (with Tb, Ce)

Relevant parameters

- Light decay time (pulse duration)
- Emitted light spectrum
- Attenuation length
- Light yield
- Radiation hardness
- Physical and chemical properties (heat and electric conductivity, thermal stability, melting point, heat dissipation)

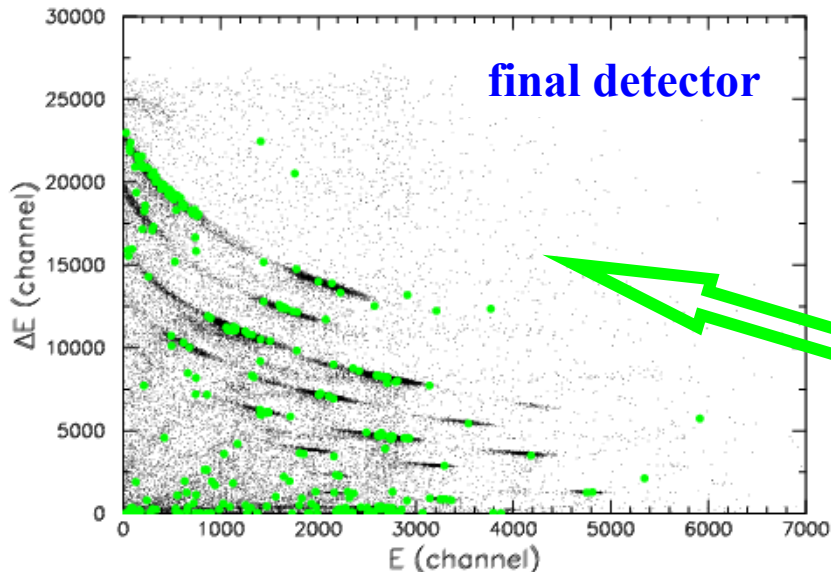

FIBBS (Fibre Based Beam Sensor)

NIM A 419 (1998) 83

Projectile Selection: Tagging Procedure

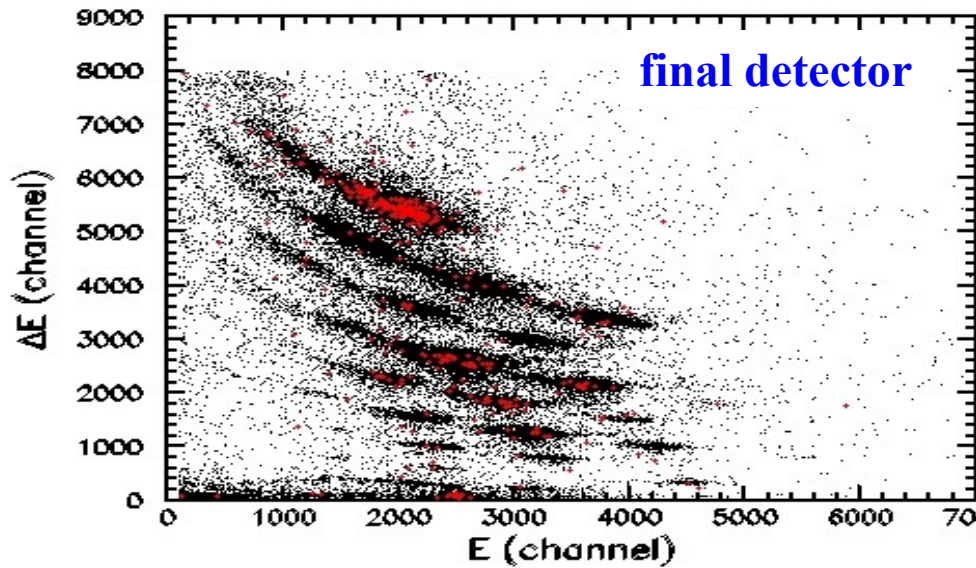

Identification can be checked looking to the $\Delta E - E$ scatter plot in forward detectors

tagging detector

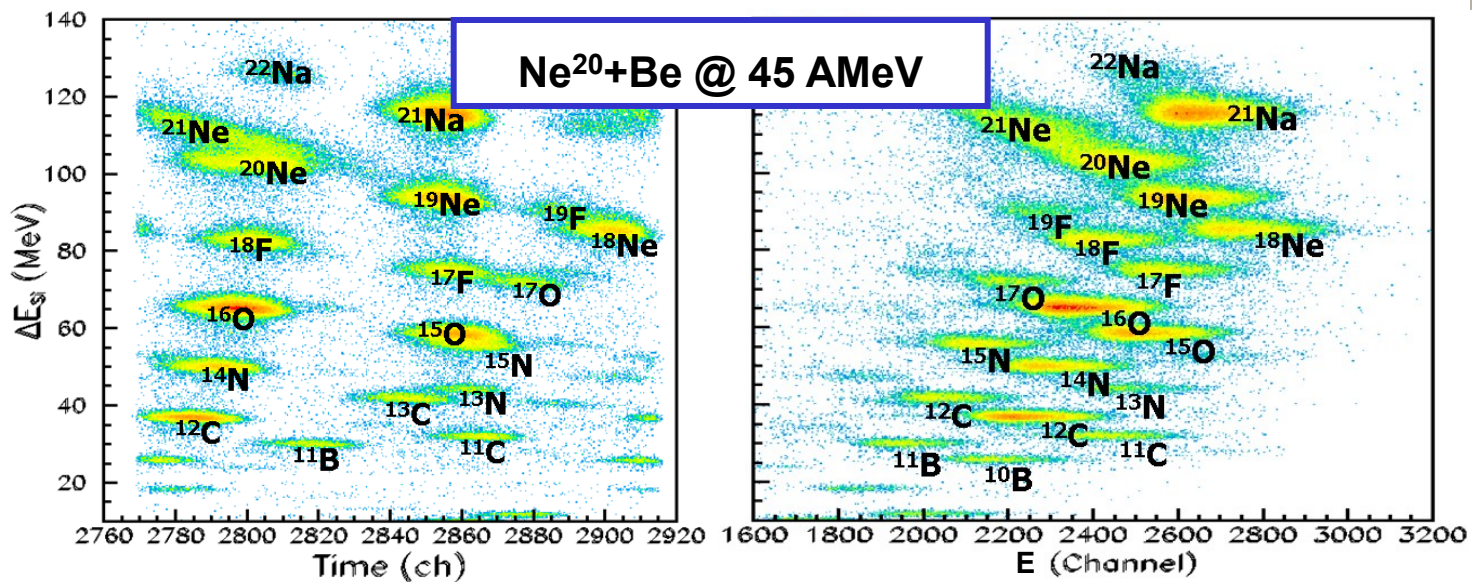

Tagging Procedure

In-flight production of radioactive beams (FRIBs)

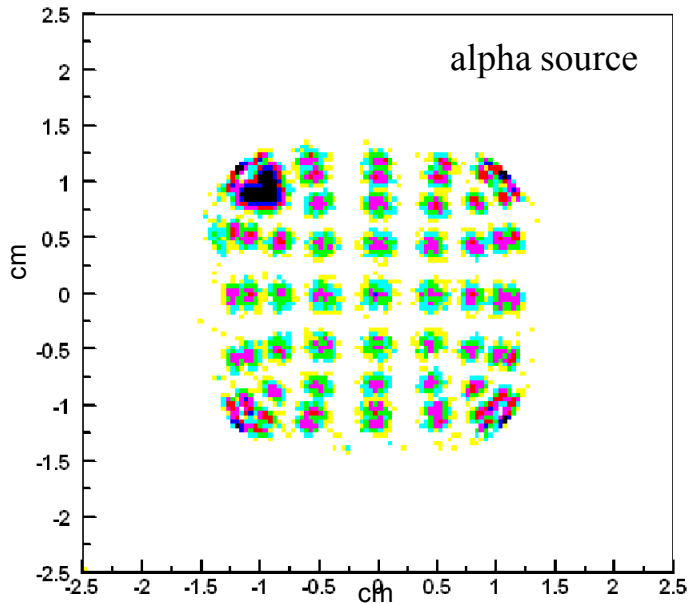

Detector used in FRIBs points, for monitoring the beam and tagging the particles
