April 2024

<https://hep.ph.liv.ac.uk/ariadne>

## Talk Outline

- Background to the ARIADNE Program
- The ARIADNE+ detector at the CERN Neutrino Platform
  - Analysis using cosmic data over a 3 week run
- Upgrades to the 1 tonne ARIADNE detector
- Outlook

## ARIADNE Detection Principle

*ARIADNE aims to demonstrate light readout as a viable alternative to charge in dual-phase TPC neutrino experiments*

- Incoming particles ionise LAr and create **prompt scintillation** light (**S1**)
- Electrons drift towards the **extraction grid** situated below the liquid level
- A **THGEM** (THick-Gaseous Electron Multiplier) amplifies drift charge (capable of >30 kV/cm in LAr) generating **secondary scintillation** light (**S2**)
- **WLS** (Wavelength Shifting) for an intensifier stage before imaging with Timepix3 camera

**ARIADNE (ARgon ImAGING Detection chamber)**

## The ARIADNE Advantage - Optical TPCs

- Benefits over previous charge readout methods:
  - **High Resolution:** For e.g. TPX3 camera has 256 x 256 pixels, imaging 35 x 35 cm area, as on ARIADNE, gives  $\approx 1$  mm resolution
  - **Sensitivity to low energies:** Gain is generated by the THGEM; a THGEM accelerated electron can generate upwards of 100 photons, cameras can be sensitive to single photons
  - **Very low Noise:** Sensors are decoupled from TPC electronics
  - **Ease of Access:** Technology can be swapped in and out even with TPC operating
  - **Cost Efficient:** No need for thousands of internal charge TPC readout channels, pre-amps etc.

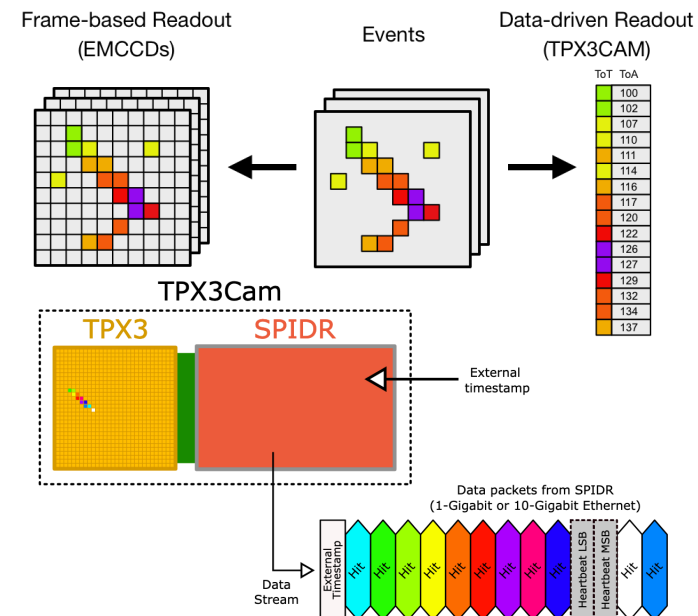

## The ARIADNE Advantage - Full 3D optical readout with Timepix3

- Well established technology by the **CERN Medipix** collaboration:
  - **Natively 3D:** Timepix chip gives X and Y position, Time of Arrival (ToA) (which is equivalent to z position) and Time over Threshold (ToT) (equivalent to intensity)
  - **Background Suppression:** Data driven readout based on hits rather than frame
  - **Efficient data storage:** Continuous streaming, triggerless operation - few kBytes per event
  - Technology ready for deployment **now!**

TPX3 ASIC Chip bump bonded to an optical sensor

Sensor resolution	256x256 pixels
Pixel size	55 $\mu$ m x 55 $\mu$ m
Max readout rate	80Mhits $\cdot$ sec <sup>-1</sup>
Time resolution	1.6 ns
Time over Threshold Resolution	10 bit

## ARIADNE: Optical Readout for kilo-tonne scale LAr TPCs

- Proven scalable technology
- Cost efficient, comparable performance to other readout methods
- Considered an option for one of the phase 2 modules

Table: As an example, demonstration figures for use of TimePix within Dune - 720m<sup>2</sup>, 60m x 12m

Camera type	Sen. Size (pixels)	Cameras to cover 1m <sup>2</sup>	Resolution (mm/pix)	Total cameras (to cover 720m <sup>2</sup> )
TPX3	256x256	9	1.3 (~ARIADNE)	6480
TPX3	256x256	4	2	2880
TPX3	256x256	1	4 (~ARIADNE+)	720
TPX4	512x448	4	1	2880
TPX4	512x448	1	2	720
<b>TPX4</b>	<b>512x448</b>	<b>0.66 (1.5m/cam)</b>	<b>3</b>	<b>320</b>

# Large-scale demonstration of the ARIADNE LArTPC optical readout system at the CERN Neutrino Platform

*Testing optical readout on a scale  
relevant for DUNE using the existing  
Proto-DUNE cold box*

*15 Tonne Cryogenic Vessel filled from  
Proto-DUNE dual-phase cryostat*

*Carried out between February  
and April 2022*

# ARIADNE+: Cryostat Configuration

4 TPX3 Cameras imaging 1 x 1 m active region each (3 x visible, 1 x Direct VUV)

Nitrogen Flushed Reentrant Viewports

Light Readout Plane (LRP)

Cathode and imbedded Photo-detectors (USC)

20 cm drift region

## ARIADNE+ Detector - Glass THGEMs

Glass THGEMs - Liverpool development into glass as a dielectric for THGEMs

- Tolerant to sparking and discharges as it does not carbonise like FR4
- Abrasive machining creates bi-conical holes that store charge over time
- Less prone to sagging compared to FR4 at larger surface areas

**New for 2024:**  
**Liverpool**  
**Micropattern**  
**Detector Facility**

(a) 1 s binning.

(b) 20 s binning with fit.

Abrasive machining facility in the University of Liverpool physics building - producing ARIADNE glass THGEMs and capable of much more

(<https://www.mdpi.com/2076-3417/11/20/9450>)

## Light Readout Plane (LRP)

- Largest Glass THGEM array made to date
- 16 50 x 50 cm Glass THGEMs, developed by Liverpool Patent (Patent GB2019563.2)
- 1.1 mm thick, 500  $\mu\text{m}$  ID holes,  $\sim 500\text{k}$  holes per THGEM, 800  $\mu\text{m}$  pitch hexagonal array
- 12 50 x 50 cm PEN coated WLS glass
- Photochemically etched modular extraction grid
- 2.3 x 2.3 m frame mounted underneath cold box lid

Timepix 3 Camera

Relay optics

Image intensifier

Objective lens

Visible (f0.95,  
10.5 mm)

Custom made VUV  
MgF<sub>2</sub> Lens  
(f3, 11mm, 5mm  
diameter)

## Data Collection

- Very stable cryogenic conditions thanks to the great CERN team
- Argon purity was approximately 0.5 msec
- Three weeks of data collection, refilled twice
- USC collected S1 data using X-ARAPUCAS embedded within the cathode

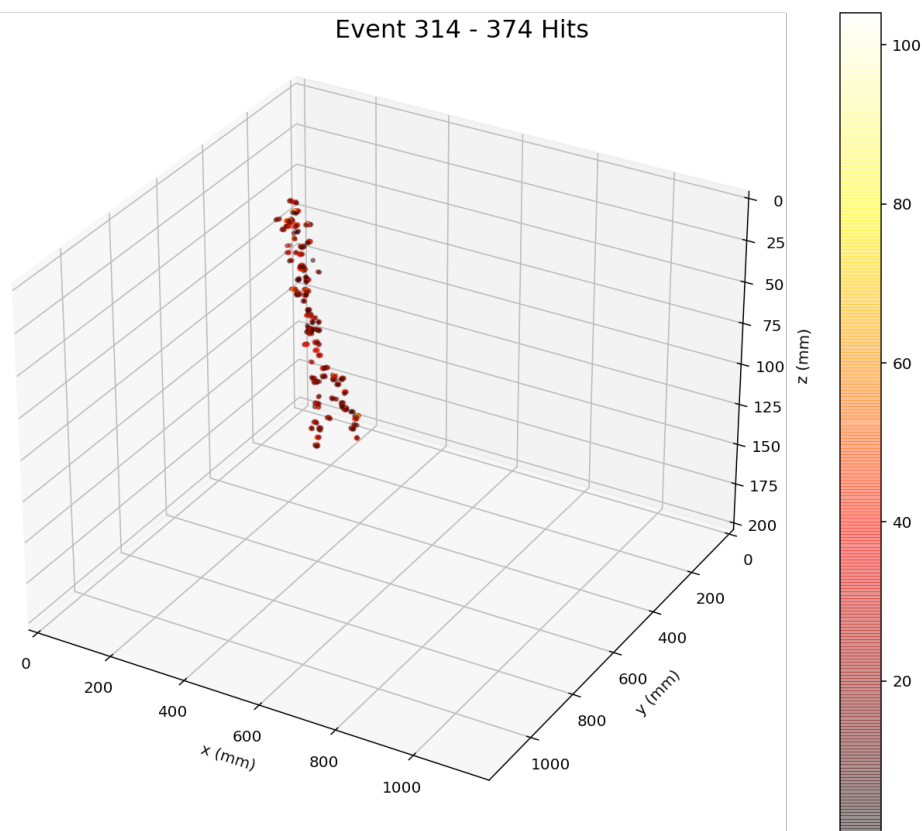

X-ARAPUCAS

## Gallery of Events - Visible Light

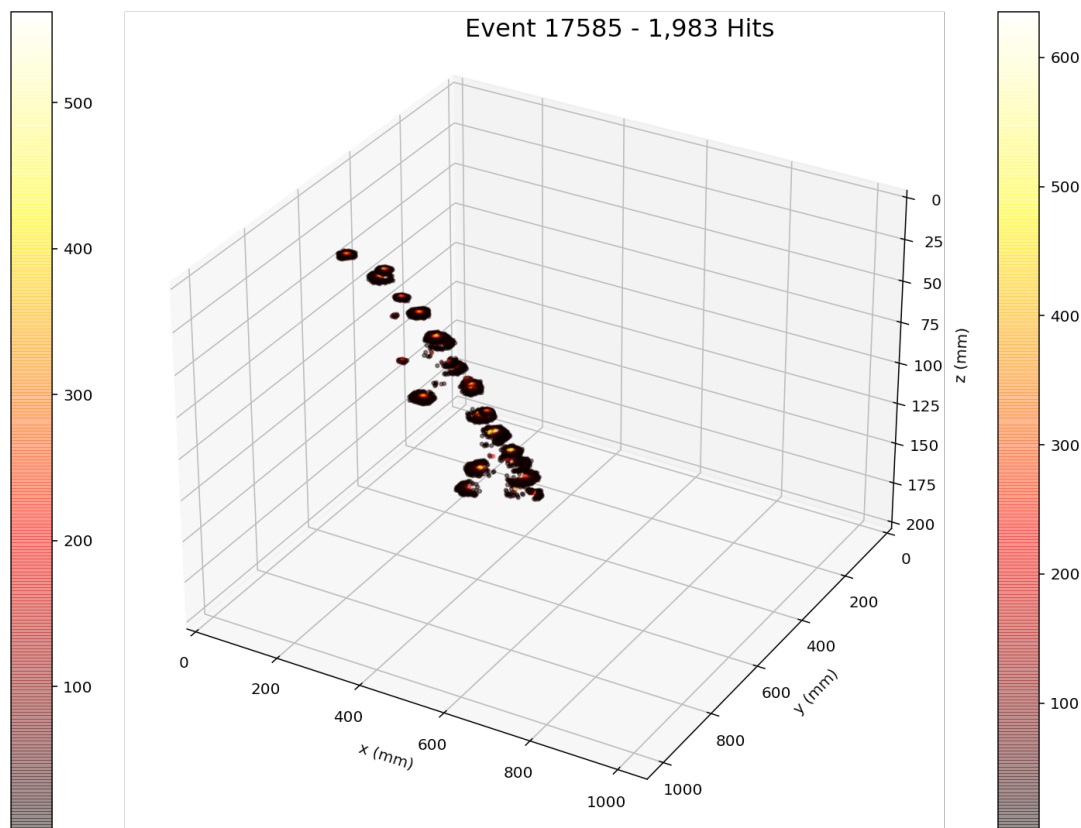

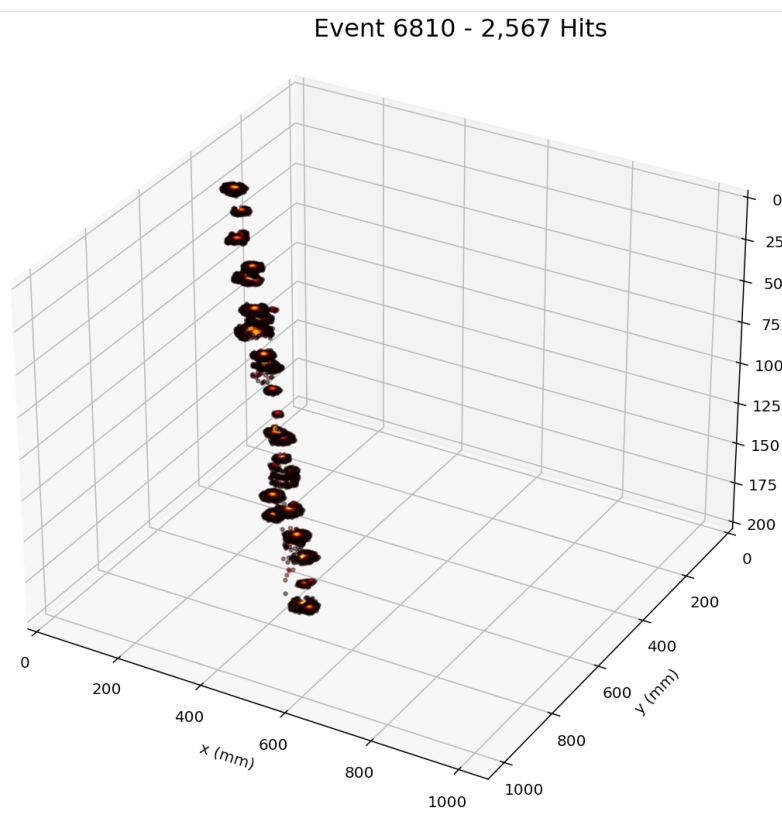

~4 mm Resolution

VUV Light

Coldbox cosmics 11mm VUV ToT x-y plane

## Energy Calibration and Resolution

- Track fitting to through going muons (Through THGEM and greater than 19 cm depth)
- Energy conversion :  $199.10 \pm 1.73$  ADU / cm
- Energy resolution :  $16.73 \pm 0.16$  %

Further detail on the run and analysis can be found in this paper.

## S1 Light Collection Studies

- USC collected data using the X-ARAPUCAS embedded within the cathode of the cold box
- Studies into discriminating between S1 and S2 signals
- Analysis is ongoing - correlation between X-ARAPUCA signal and ARIADNE+ data

X-ARAPUCAS

## **ARIADNE Upgrade**

- First time running multiple Timepix3 cameras on ARIADNE
- Swapping the existing FR4 GEM with a glass THGEM
- Introduction of a calibration source for probing the low-energy threshold of the detector
- Two different types of intensifier - one previously used on ARIADNE and the new intensifier on ARIADNE+
- Addition of a Darkside PDU for investigating Dark Matter detection feasibility (light saturation etc.) - Neutrino & DM ...

## Outlook: Proposed Proto-DUNE Instrumentation

- Using Proto-DUNE dual-phase to test optical readouts for Neutrinos and DM; TPX3Cams, DarkSide PDUs & X-ARAPUCAS
- TPX3 cam superb 3D tracking capability with energy sensitivity down to  $\sim 100\text{keV}$
- DarkSide-20k type Photo Detection Modules (single keV energy threshold)

In dark green shade is the FoV of the TPX cameras (1mx1m) using the current cryostat ports

## Conclusions

### TPX3Cam TPC Benefits

Raw data is natively 3D

Huge readout rates possible (80 MHits/s)

Zero suppressed readout (approx. few kbytes per event)

High resolution with approx. 1 mm per pixel

Easy access for swapping in/out technologies

Same readout is possible for dual-phase or gas TPCs

Comparatively low cost to other readout methods

- Optical readout achieved with stable detector conditions has been demonstrated at the same scales as that for vertical drift tests (CERN Neutrino Platform Cold Box)
- Dual phase extraction region very stable at large scale
- TPX3 and Glass THGEM technology is ready for deployment **now**
- Considered an option for **DUNE LAr Far Detector**. An option for DUNE **GAr Near Detector?** (if enough light is produced in pressurised gas Argon. Tests are in preparation in collaboration with USC)

**Thank You for Listening!**

**Any questions?**

Once again thank you to the amazing CERN team for hosting ARIADNE+ and all their help getting the detector up and running!

## THGEM S2 Light Production

VUV (126nm) light produced through de-excitation of Argon gas.  
TPB Wavelength shifter above THGEM converts to 430nm.

At low field (<2kV/cm), S2 light production is linearly proportional to THGEM field. No charge gain. Very stable operation without discharges. No ion production.

At higher fields, electron multiplication occurs (Townsend avalanche).  
Exponentially increasing S2 light production -> Improved sensitivity/threshold

## TPX3 Data Packets

Each Hit (Min 500 electrons):

- X Position
- Y Position
- Time of Arrival (ToA)
- Time over Threshold (ToT)

## THGEM Characterisation

Mean TPX3Cam ToT rate (calculated as the summed ToT of all hits in a run divided by the total duration of the run and measured in ADU per second) as a function of the electric field across the THGEM. A single function—comprising a combination of linear and exponential functions is fitted to the data

## **Energy Calibration and Resolution**

Simply the conversion between the incident light intensity in ADU and the corresponding physical energy in MeV

Through-going muons are ideal for calculating this calibration, they are minimum-ionising particles (“MIPs”) with a well-known mean energy deposition rate,  $dE/dX$ , of 2.12 MeV/cm

The summed ToT is calculated across all hits which comprise each event, and this summation is divided by the 3D track length of the through-going track.

The energy resolution, defined as the Landau ( $\eta$ ) and Gaussian ( $\sigma$ ) widths combined in quadrature and expressed as a fraction of the MPV
