
Associated production of Higgses in 2HDMs

S. Banik, GC, A. Crivellin, H. Haber - IN PREPARATION

Guglielmo Coloretti
University of Zurich and Paul Scherrer Institut
6.11.2024

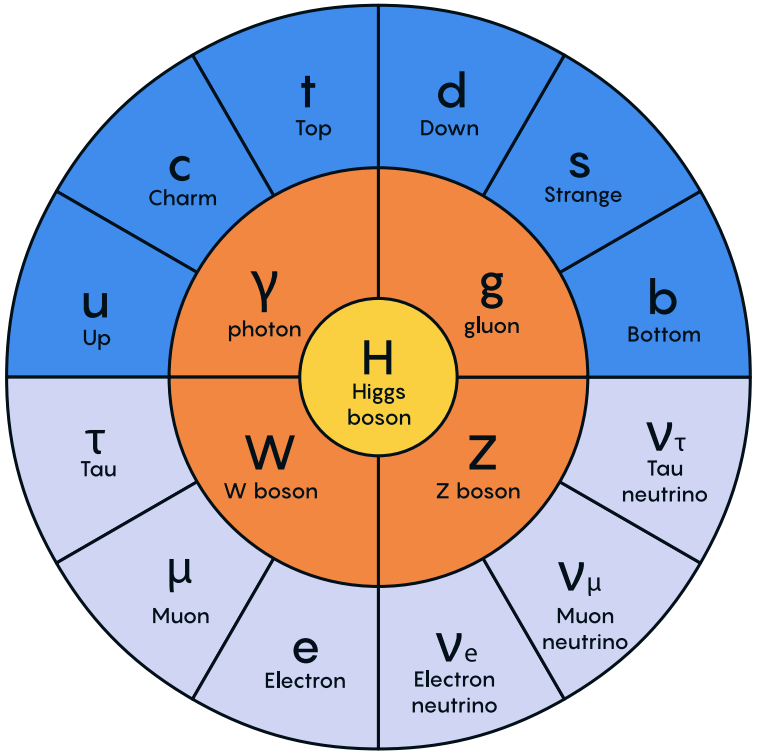
Outline

1. (Asymmetric-) associated production of Higgses at the LHC
2. Drell-Yan production of Higgses in 2HDMs
3. The flavored aligned 2HDM (A-2HDM)
4. Correlating Br$[A \to \gamma\gamma]$ with EDMs
5. The 152 GeV and 95 GeV di-photon excesses

Scalar sector

$$\mathcal{L} = +\mu^2|\Phi|^2 - \lambda|\Phi|^4$$

- **Minimality of the scalar sector of the SM not guaranteed theoretically**
- Scalar extensions common to multiple NP models
- Run-3 data (on their way) and HL-LHC stage will provide a unique opportunity to inspect non-trivial signatures



(Asymmetric-) associated production

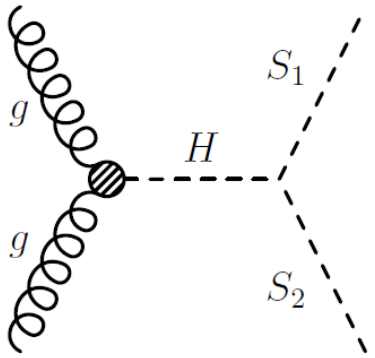
- Provides a yet unexplored window on new physics [ATLAS and CMS review] [Talk by Maggie] [Talk by Davide]
- Additional particles required in the signal regions (on top of the decays of the NP candidate)
- **Reduced SM background and enhanced NP sensitivity**

Searches at high energy → Suffers from → **Small cross sections**

Searches at low energy → Swamped by → **Large background**

(Asymmetric-) associated production

- Provides a yet unexplored window on new physics [ATLAS and CMS review] [Talk by Maggie] [Talk by Davide]
- Additional particles required in the signal regions (on top of the decays of the NP candidate)
- **Reduced SM background and enhanced NP sensitivity**



Gluon-fusion initiated via a heavy scalar

(Asymmetric-) associated production

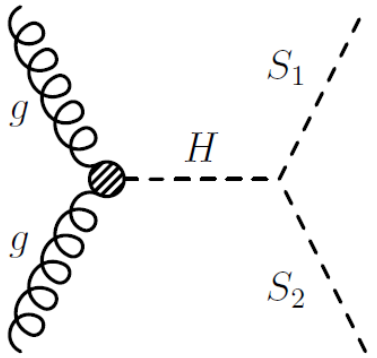
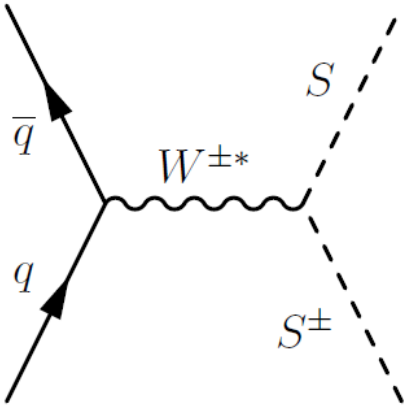
- Additional particles required in the signal regions (on top of the decays of the NP candidate)
- **Reduced SM background and enhanced NP sensitivity**

Future lepton colliders!



Gluon-fusion initiated via a heavy scalar



Drell-Yan production

Drell-Yan production

New Higgses mostly produced via Drell-Yan at the LHC must have specific properties

Drell-Yan production

New Higgses mostly produced via Drell-Yan at the LHC must have specific properties

Transform non-trivially under $SU(2)_L$

Gauge interaction with SM fields

Drell-Yan production

New Higgses mostly produced via Drell-Yan at the LHC must have specific properties

Transform non-trivially under $SU(2)_L$

No direct (or tiny) Yukawa couplings

Gauge interaction with SM fields

Suppressed gluon-fusion production

Drell-Yan production

New Higgses mostly produced via Drell-Yan at the LHC must have specific properties

Transform non-trivially under $SU(2)_L$	Gauge interaction with SM fields
No direct (or tiny) Yukawa couplings	Suppressed gluon-fusion production
Have small vacuum expectation value	Suppressed VBF and VH production

Drell-Yan production

New Higgses mostly produced via Drell-Yan at the LHC must have specific properties

Transform non-trivially under $SU(2)_L$	Gauge interaction with SM fields
No direct (or tiny) Yukawa couplings	Suppressed gluon-fusion production
Have small vacuum expectation value	Suppressed VBF and VH production
Small mixing with the SM Higgs boson	Alignment limit

2HDMs and Drell-Yan

2HDMs strongly motivated:
MSSM, GUT, PQ (strong CP), custodial symmetry

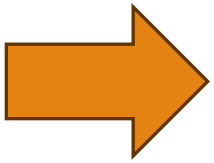
2HDMs and Drell-Yan

2HDMs strongly motivated:
MSSM, GUT, PQ (strong CP), custodial symmetry

$Y_{\Phi_{\mathrm{NP}}} \ll 1$

$\langle \Phi_{\mathrm{SM}} \rangle \approx v, \langle \Phi_{\mathrm{NP}} \rangle \ll 1$

Small mixing



Suppressed GF

Suppressed VBF/VH

Higgs/Flavor bounds

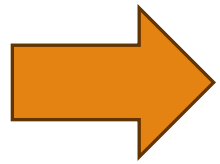
2HDMs and Drell-Yan

2HDMs strongly motivated:
MSSM, GUT, PQ (strong CP), custodial symmetry

$$Y_{\Phi_{\mathrm{NP}}} \ll 1$$

$$\langle \Phi_{\mathrm{SM}} \rangle \approx v, \langle \Phi_{\mathrm{NP}} \rangle \ll 1$$

Small mixing

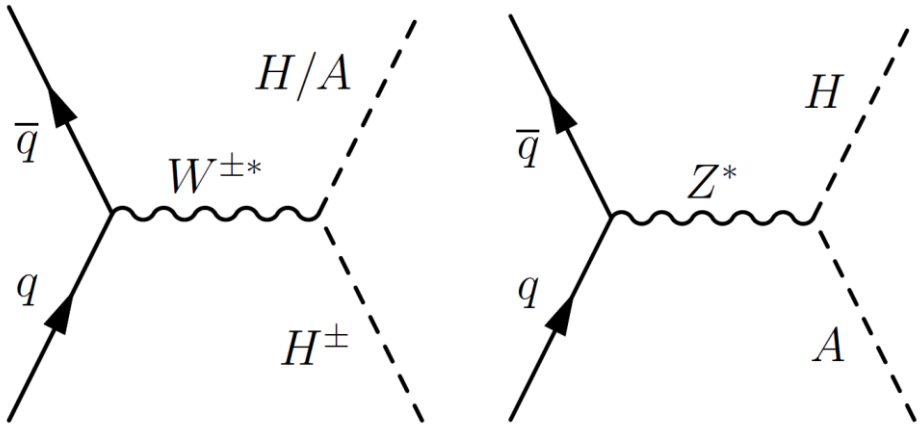


Suppressed GF

Suppressed VBF/VH

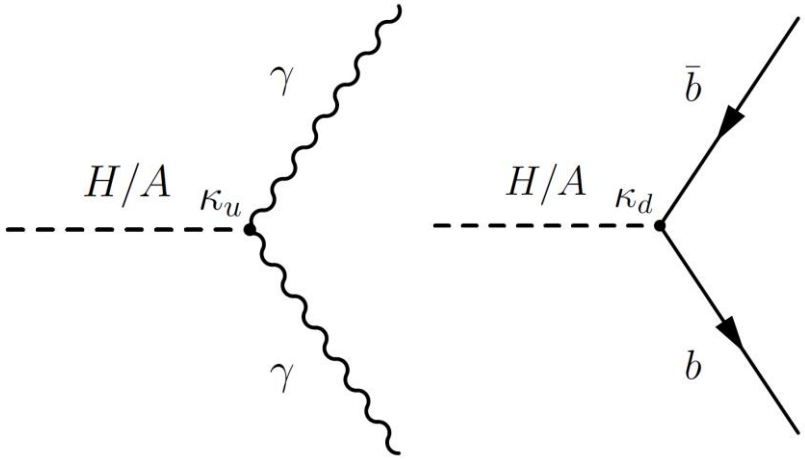
Higgs/Flavor bounds

Drell-Yan is the main production mechanism



2HDMs and Drell-Yan

- Difficult to obtain sizable Br$[H/A \to \gamma\gamma]$ with Z_2 symmetries for masses around the EW scale

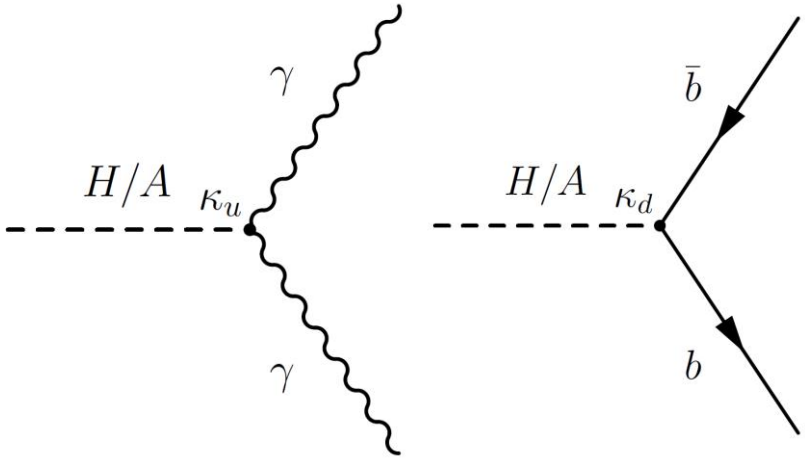


Alignment limit $(\beta - \alpha) \approx 0$

	Type-I	Type-II
κ_u	$-1/\tan(\beta)$	$-1/\tan(\beta)$
κ_d	$1/\tan(\beta)$	$\tan(\beta)$

2HDMs and Drell-Yan

- Difficult to obtain sizable Br$[H/A \to \gamma\gamma]$ with Z_2 symmetries for masses around the EW scale



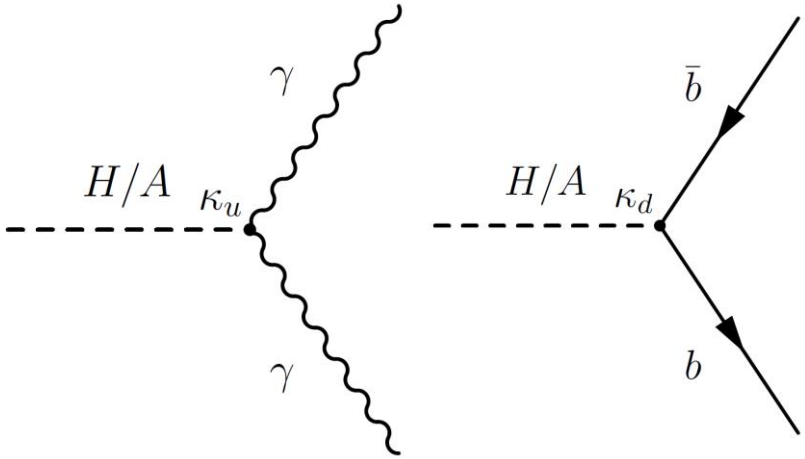
Alignment limit $(\beta - \alpha) \approx 0$

	Type-I	Type-II
κ_u	$-1/\tan(\beta)$	$-1/\tan(\beta)$
κ_d	$1/\tan(\beta)$	$\tan(\beta)$

$$\kappa_u \gg 1 \Rightarrow \kappa_d \gg 1$$

2HDMs and Drell-Yan

- Difficult to obtain sizable Br$[H/A \to \gamma\gamma]$ with Z_2 symmetries for masses around the EW scale



Alignment limit $(\beta - \alpha) \approx 0$

	Type-I	Type-II
κ_u	$-1/\tan(\beta)$	$-1/\tan(\beta)$
κ_d	$1/\tan(\beta)$	$\tan(\beta)$

$\kappa_u \gg 1 \Rightarrow \kappa_d \gg 1$

$\kappa_u \gg 1, \kappa_d \ll 1$
Flavor bounds: $m_{H^\pm} > 600$ GeV

[J. Haller, A. Hoecker et al.]

$\kappa_u \gg 1, \kappa_d \ll 1$
Flavor bounds: $m_{H^\pm} > 600$ GeV

[J. Haller, A. Hoecker et al.]

- Composite Higgs? **Relaxing Z_2 symmetries?**

A-2HDM

[P. Tuzon, A. Pich]

- Yukawa's of ϕ_1 $\propto$ Yukawa's of ϕ_2 $\Longrightarrow$ **NO FCNC (tree)**

$$\mathcal{L}_Y = -\overline{Q}_L Y_d(\phi_1 + \zeta_d \phi_2) d_R - \overline{Q}_L Y_u(\tilde{\phi}_1 + \zeta_u^* \tilde{\phi}_2) u_R$$
$$- \overline{L}_L Y_\ell(\phi_1 + \zeta_\ell \phi_2)\ell_R + \text{h.c.}$$

$\zeta_u \ll 1$ $\rightarrow$ suppressed GF (small mixing)

A-2HDM

[P. Tuzon, A. Pich]

- Yukawa's of ϕ_1 $\propto$ Yukawa's of ϕ_2 $\Longrightarrow$ **NO FCNC (tree)**

$$\mathcal{L}_Y = -\overline{Q}_L Y_d(\phi_1 + \zeta_d \phi_2) d_R - \overline{Q}_L Y_u(\tilde{\phi}_1 + \zeta_u^* \tilde{\phi}_2) u_R$$
$$- \overline{L}_L Y_\ell(\phi_1 + \zeta_\ell \phi_2) \ell_R + \text{h.c.}$$

$\zeta_u \ll 1$ $\rightarrow$ suppressed GF (small mixing)

- No Z_2 symmetry imposed $\Longrightarrow$ **λ_6 and λ_7 terms allowed**

$$\mathcal{V} = \mathcal{V}_{Z_2} + [\lambda_6(\phi_1^\dagger \phi_1) + \lambda_7(\phi_2^\dagger \phi_2)]\phi_1^\dagger \phi_2 + \text{h.c.}$$

A-2HDM

[S. Banik, GC, A. Crivellin, H. Haber - IN PREPARATION]

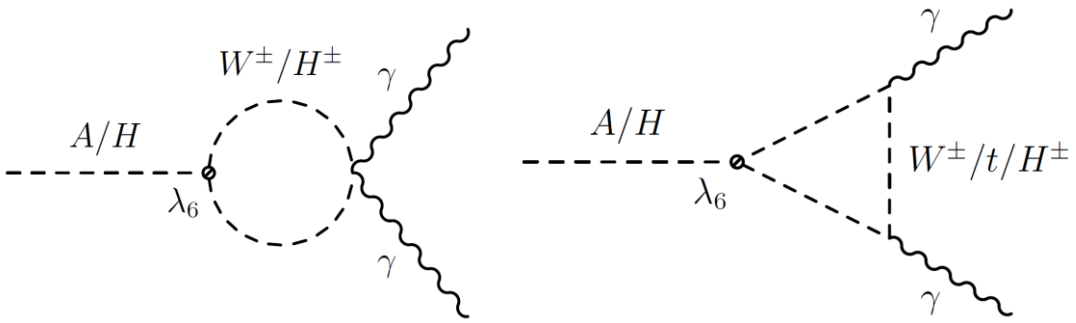
- Yukawa's of ϕ_1 $\propto$ Yukawa's of ϕ_2 $\Longrightarrow$ **NO FCNC (tree)**

$$\mathcal{L}_Y = -\overline{Q}_L Y_d(\phi_1 + \zeta_d \phi_2) d_R - \overline{Q}_L Y_u(\tilde{\phi}_1 + \zeta_u^* \tilde{\phi}_2) u_R$$
$$- \overline{L}_L Y_\ell(\phi_1 + \zeta_\ell \phi_2) \ell_R + \text{h.c.}$$

$\zeta_u \ll 1$ → **suppressed GF (small mixing)**

- No Z_2 symmetry imposed $\Longrightarrow$ **λ_6 and λ_7 terms allowed**

$$\mathcal{V} = \mathcal{V}_{Z_2} + [\lambda_6(\phi_1^\dagger \phi_1) + \lambda_7(\phi_2^\dagger \phi_2)]\phi_1^\dagger \phi_2 + \text{h.c.}$$



Sizable Br$[H/A \to \gamma\gamma]$ through $H^\pm$ loop

A-2HDM: CP-violation

[S. Banik, GC, A. Crivellin, H. Haber - IN PREPARATION]

- CP-violation of the model (Baryogenesis?)
  [K. Enomoto, S. Kanemura, Y. Mura]

Yukawa sector: $\zeta_u, \zeta_d, \zeta_\ell$

Scalar potential: $\lambda_5, \lambda_6, \lambda_7$

A-2HDM: CP-violation

[S. Banik, GC, A. Crivellin, H. Haber - IN PREPARATION]

- CP-violation of the model (Baryogenesis?)
  [K. Enomoto, S. Kanemura, Y. Mura]

Yukawa sector: $\zeta_u, \zeta_d, \zeta_\ell$

Scalar potential: $\lambda_5, \lambda_6, \lambda_7$

- $\Re[\lambda_6]/\Im[\lambda_6]$ drives Br$[H/A \to \gamma\gamma]$

A-2HDM: CP-violation

[S. Banik, GC, A. Crivellin, H. Haber - IN PREPARATION]

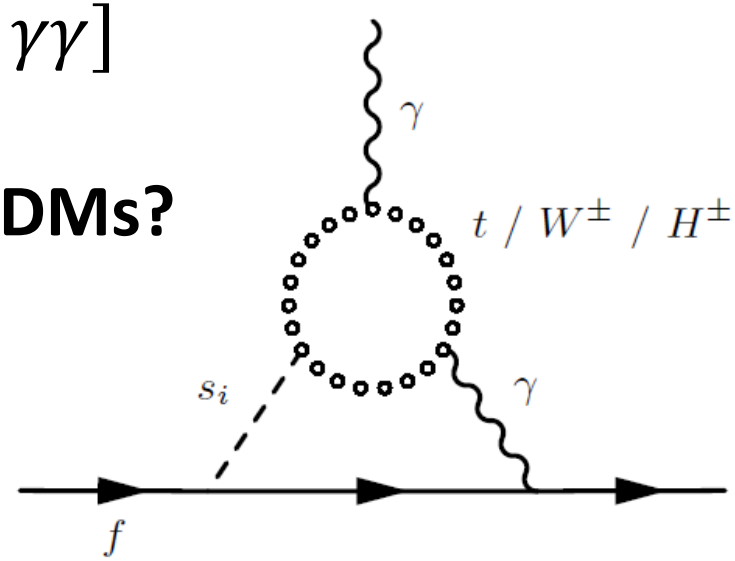
- CP-violation of the model (Baryogenesis?)
  [K. Enomoto, S. Kanemura, Y. Mura]

Yukawa sector: $\zeta_u, \zeta_d, \zeta_\ell$

Scalar potential: $\lambda_5, \lambda_6, \lambda_7$

- $\Re[\lambda_6]/\Im[\lambda_6]$ drives Br$[H/A \to \gamma\gamma]$
- **Correlating Br$[A \to \gamma\gamma]$ with EDMs?**

$$i\, d_f\, \bar{f} \sigma^{\mu\nu} q_\mu \gamma_5 f \subset$$



Higgs basis

[S. Davidson, H. Haber]

- Higgs-flavor symmetry: $U(2)^{ab}_{HF}\Phi_a = \Phi_b$
- $\langle\Phi_1\rangle = v, \langle\Phi_2\rangle = 0 \quad ;$

$$\lambda_{1,2,3,4,5} \Longleftrightarrow Z_{1,2,3,4,5}$$
$$\lambda_{6,7} \Longleftrightarrow Z_{7,6}$$

Suppressed VBF / VH (small mixing)

Br$[H/A \to \gamma\gamma]$ sizable!

Z_7 independent of mixing angles

EDMs

Constraints on Br$[H/A \to \gamma\gamma]$

[M. Jung, A. Pich]

- Electron gives stringent bounds (10^{-30} e cm^{-1})
- Projections for neutron/proton ($10^{-28}/10^{-29}$ e cm^{-1})

$$d_n = +(0.78 \pm 0.03) d_d - (0.20 \pm 0.01) d_u$$
$$- e(1.1 \pm 0.55)\tilde{d}_d - e(0.55 \pm 0.28)\tilde{d}_u) + e(50 \pm 40)\ \text{MeV}\ d_G$$

- RGE improved chromo-magnetic contributions

- Analytic results
  [W. Altmannshofer, S. Gori, N. Hamer, H. Patel]

- HiggsTools, perturbativity, vacuum stability

Conclusions and Outlook

- Asymmetric associated production of scalars is a prominent signature to look for NP at the LHC
- A-2HDM offers sizable Br$[H/A \to \gamma\gamma]$ which can be correlated to CP-violating effects such as EDMs
- A-2HDM provides an independent explanation of the diphoton excesses at 95 GeV and at 152 GeV
- Outlook: correlate Br$[H/A \to \gamma\gamma]$ to Baryogenesis, SFOPT and the effects in the trilinear SM-Higgs coupling

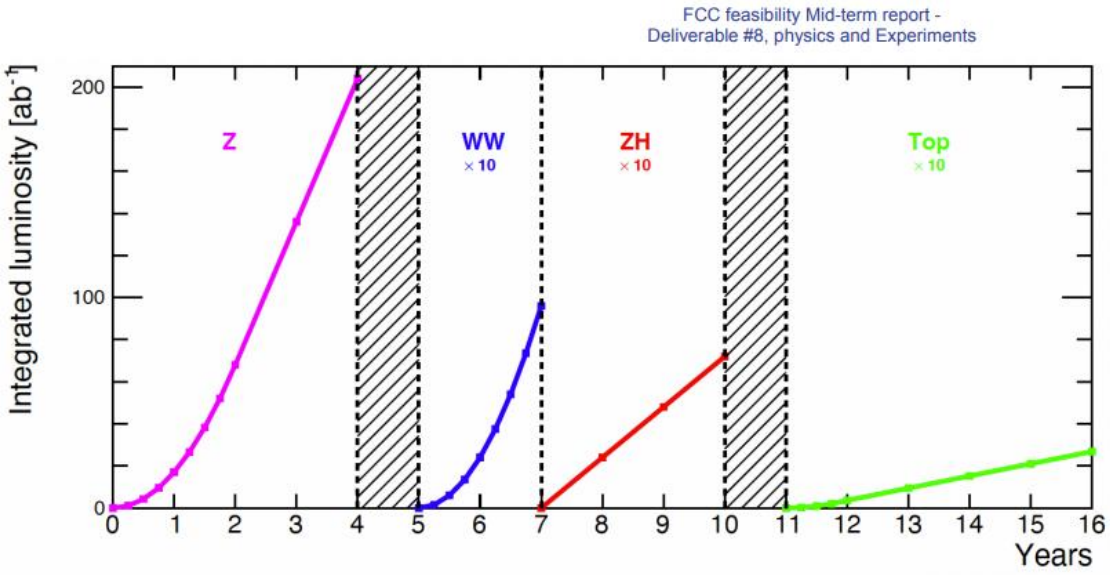
FCC-ee prospects

Courtesy of Rebeca Gonzalez Suarez

- Scalars produced in associated production via DY are a prominent candidate for FCC-ee

FCC-ee

- 16 years, 4 IPs
- Flexibility in the run scenario: in order and operation periods.
  - Additional runs, e.g. 125GeV possible
- Stringent experimental requirements



integrated luminosity per year summed over 4 IPs corresponding to 185 days of physics per year and 75% efficiency

Working point	Z, years 1-2	Z, later	WW, years 1-2	WW, later	ZH	$t\bar{t}$	
$\sqrt{s}$ (GeV)	88, 91, 94		157, 163		240	340–350	365
Lumi/IP ($10^{34}\,cm^{-2}s^{-1}$)	70	140	10	20	5.0	0.75	1.20
Lumi/year (ab^{-1})	34	68	4.8	9.6	2.4	0.36	0.58
Run time (year)	2	2	2	–	3	1	4
Number of events	6×10^{12} Z		2.4×10^{8} WW		1.45×10^{6} ZH + 45k WW → H	1.9×10^{6} $t\bar{t}$ +330k ZH +80k WW → H	

all the data of LEP1 in minutes

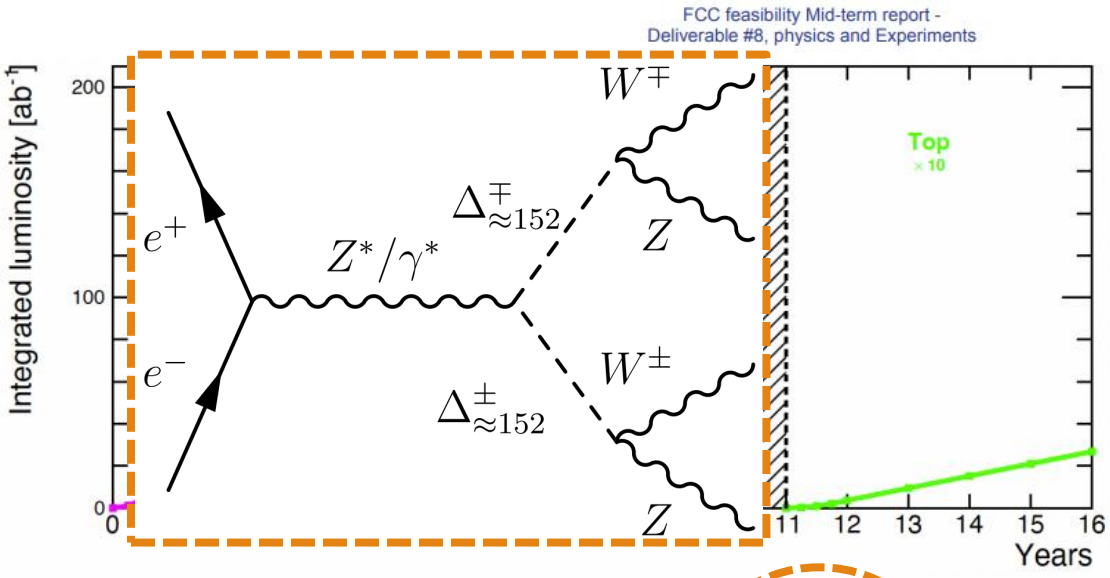
FCC-ee prospects

Courtesy of Rebeca Gonzalez Suarez

- Scalars produced in associated production via DY are a prominent candidate for FCC-ee

FCC-ee

- 16 years, 4 IPs
- Flexibility in the run scenario: in order and operation periods.
  - Additional runs, e.g. 125GeV possible
- Stringent experimental requirements



integrated luminosity per year summed over 4 IPs corresponding to 185 days of physics per year and 75% efficiency

Real triplet at the FCC-ee

- Only Z^*/γ^* s-channel (suppressed $\Delta^0\Delta^0$ production)
- Pair production of the charged components

	$SU(2)_L$	$U(1)_Y$
Δ	3	0

Parameters → $\langle\Delta\rangle = v_\Delta,\ \alpha_\Delta$
Fields → neutral Δ^0, charged $\Delta^\pm$

$6\ell + 2\nu$ at the FCC-ee

- The decay $\Delta^{\pm} \to W^{\pm}Z$ leads to a 6ℓ(+ MET) signature

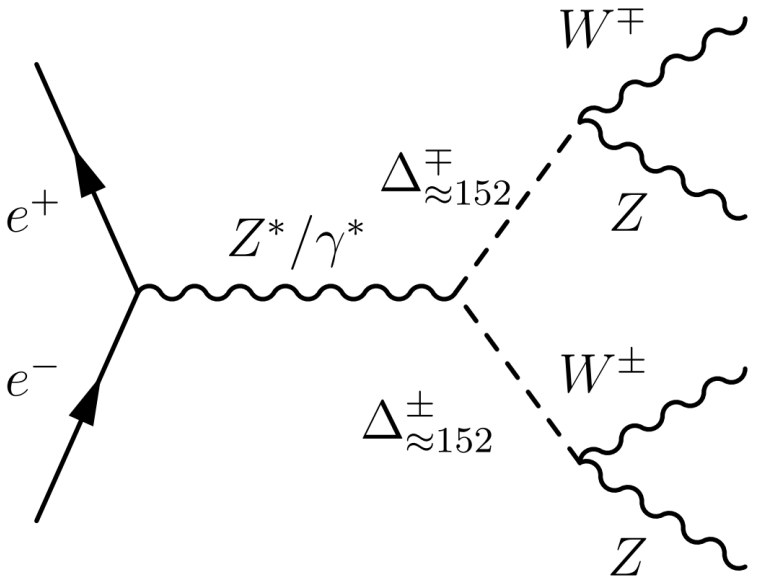
Events expected in the SM model

$$e^+e^- \to 6\ell(+\text{MET}) \approx 1$$

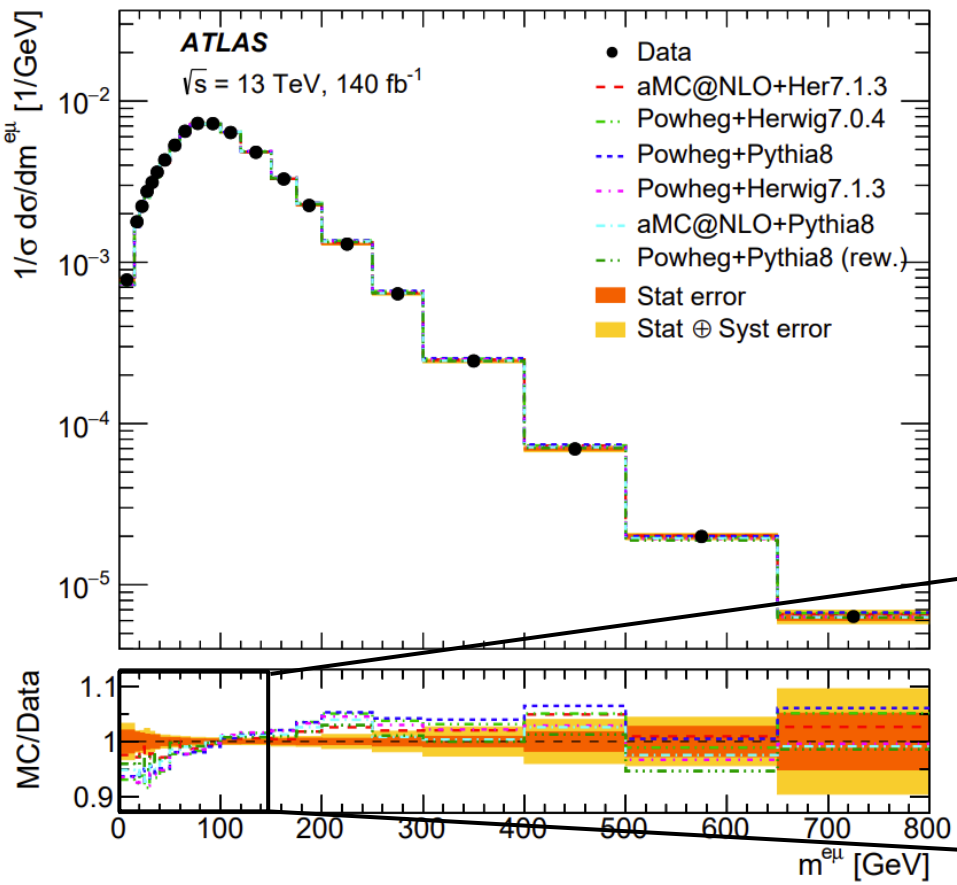
Events expected in the ΔSM model

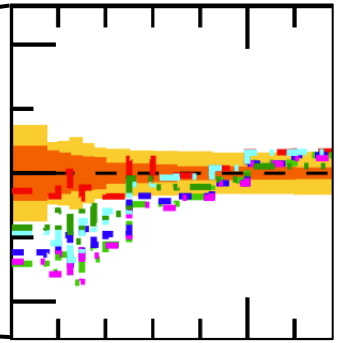
$$e^+e^- \to \Delta^{\pm}\,\Delta^{\mp} \to 6\ell + \text{MET} \approx 46$$

- Assuming the integrated luminosity at the $t\bar{t}$ working point (4 years run)
- Log-Likely-hood ratio yields $\chi^2 \approx 80$
- $\sigma(e^+e^- \to \Delta^{\pm}\,\Delta^{\mp})$ could be measured at $\approx 9\sigma$



$t\bar{t}$ distributions as a probe for NP





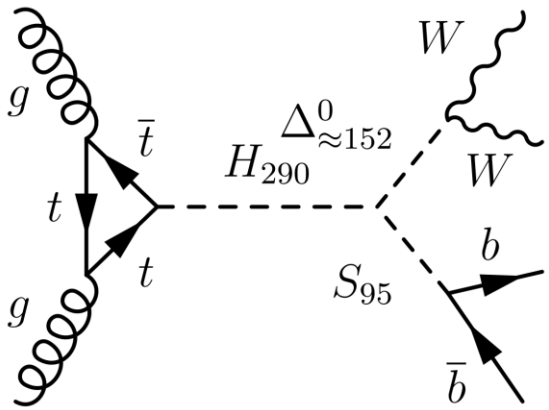
e^+e^- future colliders have a dedicated $t\bar{t}$ run: is there any new physics testable scenario?

"No model can describe all measured distributions within their uncertainties." [ATLAS]

- Higher order corrections? Toponium?
- New Physics pollution of this SM measurement?

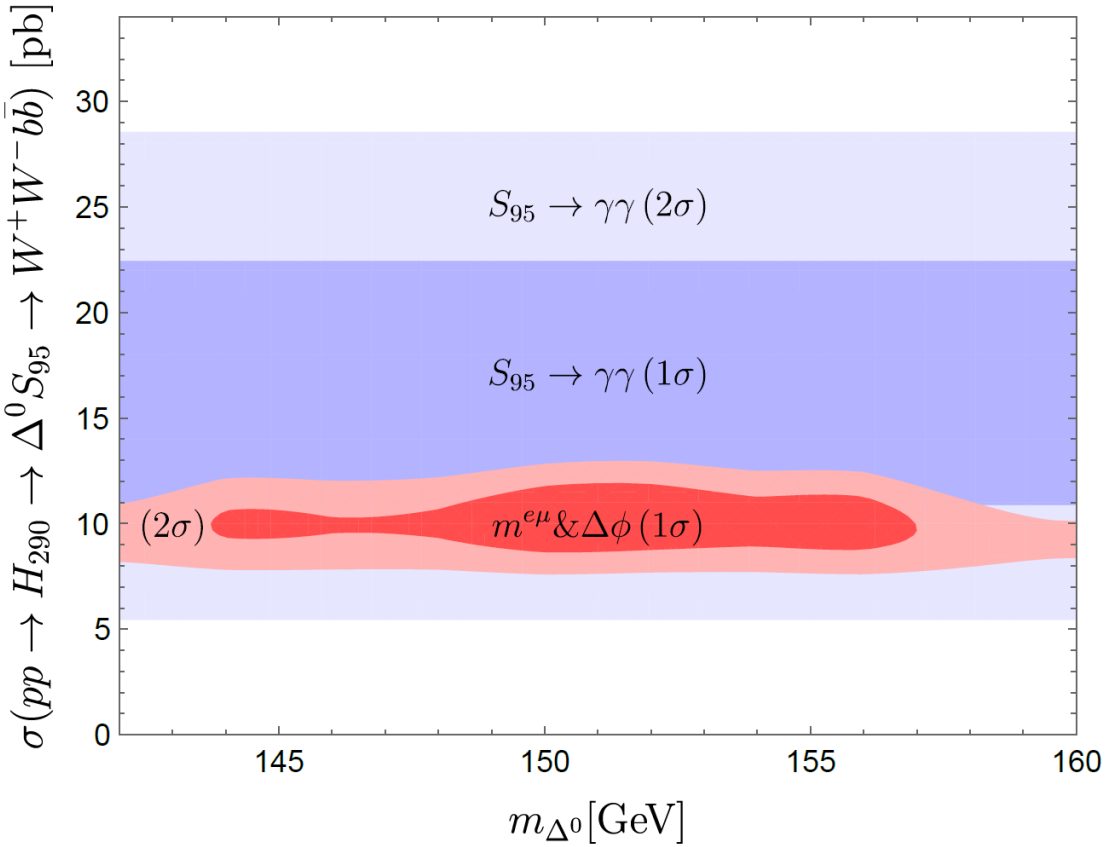
[F. Maltoni, D. Pagani et al.] [F. Maltoni, C. Severi et al.] [Bagnschi, Corcella et al.]

95 GeV and 152 GeV excesses?



- S_{95}: SM singlet mostly decaying to $b\bar{b}$
- Δ^0: real Higgs triplet mostly decaying to WW

[S. Banik, GC, A. Crivellin, B. Mellado]



Consistent with the 95 GeV $\gamma\gamma$ signal strength and a mass for Δ^0 of 152 GeV
