Nevow Developer

Tuesday 10 July 2007 14:30 (30 minutes)

I'd like to show how I wrote my starter kit 1, how it works and what you can do with it.

Nevow is sometimes a bit hard when it comes to starting a new application, especially because some details like authentication, pages organization, configuration management and deployment are not really part of what nevw provides.

In my experience with many different applications like stiq 2, wirc 3 and many others that are closed source, I found that a framework architecture for a full web stack was emerging. I extracted that structure into yet another full web stack.

My main objective is to show how each piece is architected and how it is connected with the rest

of the system. I'll also show how I (and anyone could) wrote something cool like wirc (irc from the web) using this starter kit.
