Python + .NET = IronPython

Tuesday 10 July 2007 09:00 (30 minutes)

IronPython is a new implementation of the Python programming language running on .NET. It supports an interactive console with fully dynamic compilation. It is well integrated with the rest of the .NET Framework and makes all .NET libraries easily available to Python programmers, while maintaining full compatibility with the Python language.

You will see samples, how to use and run Python in ASP.NET world. You will not see PowerPoint presentation :-)
