

ITS3 JIG manufacturing

Manufacturing ongoing

---Lead time on 7075 , we hope a couple weeks

---Changed 6082 long parts with mill operations to
Cast aluminium for straightness (5000CTP/tooling plate)

Open questions,

Requested delivery time ?

Should we anodize ?

Pro---scratch resistant and “micro deburring” because of etching
contra---theoretical isolating could be static charge problem

If we want to test now would probably be best to gain experience
