# Particle Physics Scales

## Molecule

$$10^{-9} \text{ m} = 0.000\ 000\ 001 \text{ m}$$

Delphinidin Molecule  
(blue pigment of flowers and grapes)

## Atoms

$$10^{-10} \text{ m} = 0.000\ 000\ 000\ 1 \text{ m}$$

Composed of:  
Nucleus and electrons

## Nucleus

$$10^{-14} \text{ m} = 0.000\ 000\ 000\ 000\ 01 \text{ m}$$

Composed of:  
Protons and neutrons

## Protons and Neutrons

$$10^{-15} \text{ m} = 0.000\ 000\ 000\ 000\ 001 \text{ m}$$

Composed of  
quarks

## Quarks

$$<10^{-18} \text{ m} = 0.000\ 000\ 000\ 000\ 000\ 001 \text{ m}$$

Quarks and electrons have no  
dimensions

they look just like a point

# Fundamental Particles

---

Up and down quark, electron and electron neutrino

# Fundamental Particles

1937: Discovery of the **muon** (Anderson and Neddermeyer)  
a copy of the electron but with 200 times the mass ( $m_{\mu} = 200 \times m_e$ )

quarks

u

Three complete families of fermions

# Fundamental Particles

Three complete families of fermions

## The Top quark

1995: Discovered by CDF and D0 experiments at Fermilab, Chicago

$m_{\text{top}} = 175 \text{ GeV}$   
Same mass as a  
Tungsten atom (W)

74 electrons  
74 protons  
108 neutrons

# Fundamental Particles

Neutrinos are massive  
but extremely light!

Dedicated neutrino experiments  
to study these properties

# Neutrino Interactions and Mass

Two different views of the same neutrinos

$\nu_e$

$\nu_\mu$

$\nu_\tau$

Flavor Basis  
(Interactions)

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & c_{23} & s_{23} \\ 0 & -s_{23} & c_{23} \end{bmatrix} \begin{bmatrix} c_{13} & 0 & s_{13}e^{-i\delta_{CP}} \\ 0 & 1 & 0 \\ -s_{13}e^{i\delta_{CP}} & 0 & c_{13} \end{bmatrix} \begin{bmatrix} c_{12} & s_{12} & 0 \\ -s_{12} & c_{12} & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} c_{12}c_{13} & s_{12}c_{13} & s_{13}e^{-i\delta_{CP}} \\ -s_{12}c_{23} - c_{12}s_{23}s_{13}e^{i\delta_{CP}} & c_{12}c_{23} - s_{12}s_{23}s_{13}e^{i\delta_{CP}} & s_{23}c_{13} \\ s_{12}s_{23} - c_{12}c_{23}s_{13}e^{i\delta_{CP}} & -c_{12}s_{23} - s_{12}c_{23}s_{13}e^{i\delta_{CP}} & c_{23}c_{13} \end{bmatrix}$$

$\nu_1$

$\nu_2$

$\nu_3$

Mass Basis  
(Motion)

A major goal for experiments such as DUNE  
is the study of neutrino interactions

# Neutrino Interactions and Mass

**Mass ordering unknown**

Heidi Schellman

A major goal for experiments such as DUNE  
is the study of neutrino interactions

# Fundamental Particles

Last particles discovered by 1983

	Fundamental Particles				Electrical Charge	Spin
quarks	u	c	t	g	0	1
	d	s	b	$\gamma$	0	1
leptons	$\nu_e$	$\nu_\mu$	$\nu_\tau$	$Z^0$	0	1
	e	$\mu$	$\tau$	$W^\pm$	$\pm 1$	1
	gauge bosons					

Intrinsic Angular Momentum

## Strong force (gluons)

## Electromagnetic force (photon)

## Weak force (W and Z bosons)

Beta decay:  $n \rightarrow p e^- \bar{\nu}_e$

# The Weak Force

---

The weak nuclear force has a very small range ( $10^{-18} \text{ m}$ )  
→ force carriers (W and Z boson) have to be massive

It is impossible to build a consistent theory for massive bosons like the W and Z without an additional particle.

# The Higgs Boson

Solution proposed by several theorists in 1964

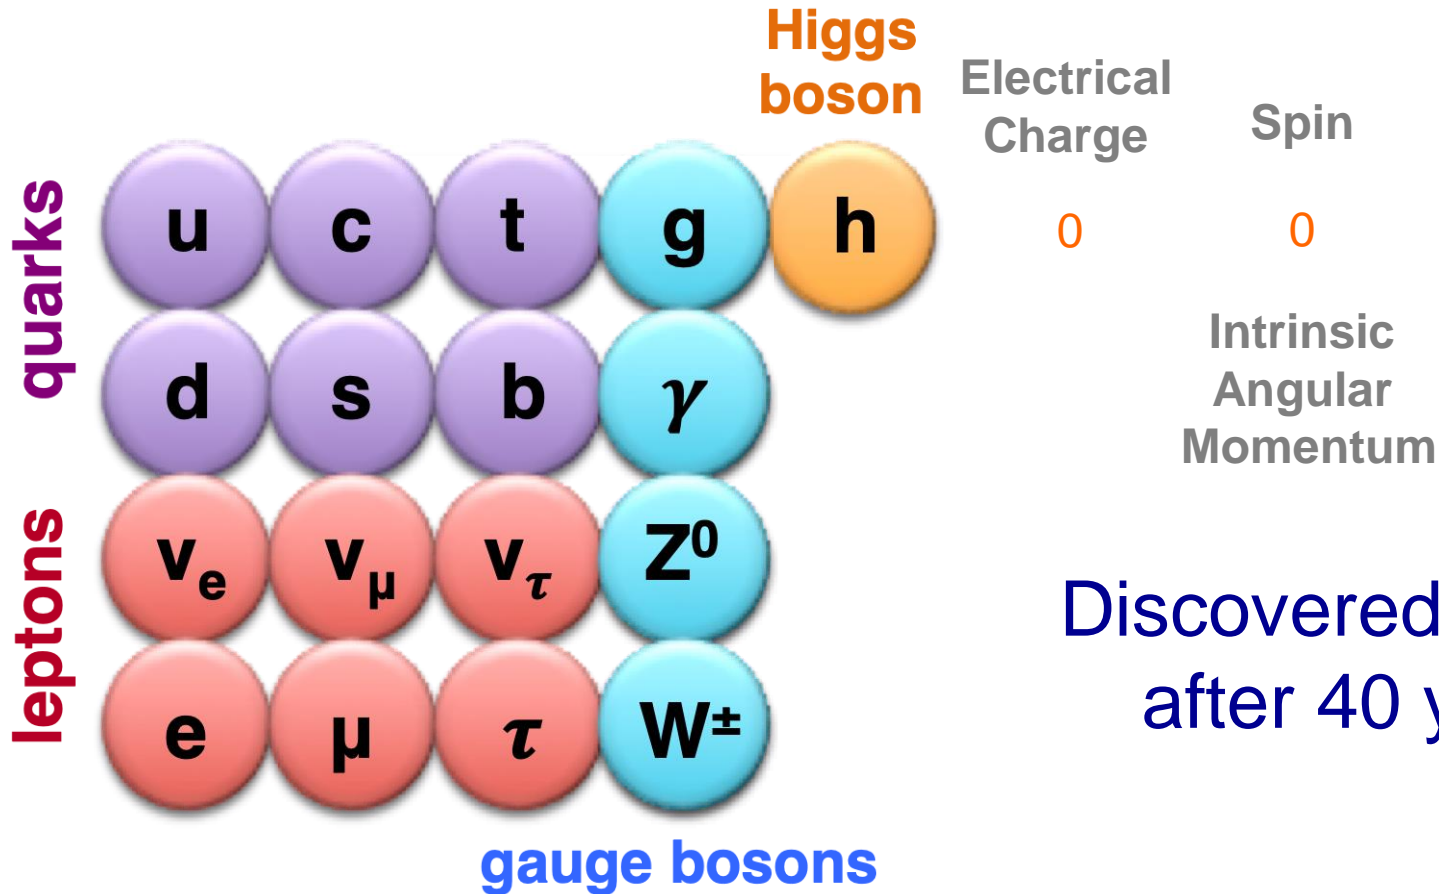

Higgs, Brout, Englert, Hagen, Guralnick and Kibble

A new fundamental particle with spin 0 (the only one in the Standard Model) could make the theory consistent again!

The LHC was built to test this theory

# Fundamental Particles

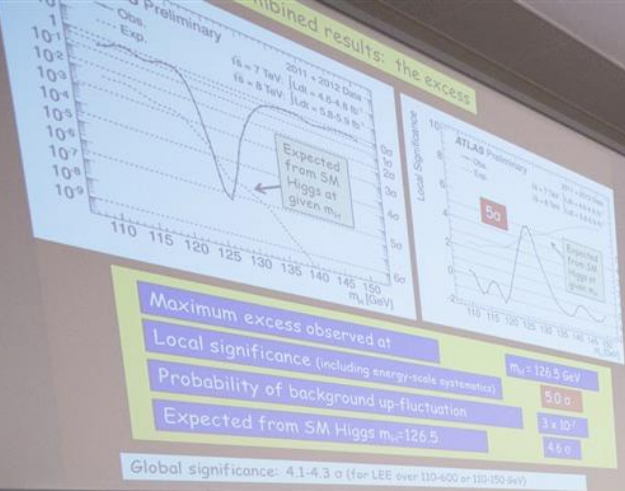

Discovered in 2012  
after 40 years!

# Higgs Particle Discovery Announcement July 4th, 2012

CERN

# Particle Detection in ATLAS

# Direction → Tracking

- Charged particles pass through detecting medium and knock out electrons
  - Gas, Silicon
- Released electrons are collected and read out as hits
- Reconstruct trajectory out of hits
- Usually in a magnetic field so momentum can be determined by curvature

# Trackers in ATLAS

# Energy → Calorimetry

- Calorimeters measure total energy of particles

- electrons, photons, jets

- Dense material causes particles to interact

- Lose energy to ionization and nuclear interactions
  - Create cascade of electrons, photons

- Sensitive or active material

- Ionizes the material and charge is collected (e.g. LAr)
  - Excitation & scintillation processes can also be used

# Calorimeters in ATLAS

# Muon Tracking

- Muons escape full detector → only other particle is neutrino
- Use tracking detectors that cover large areas far away from collision region to identify muons

# Muon System in ATLAS

**Installation completed in 2008**

# Muon System in ATLAS – Upgrade in 2021

40 million per second

~1000 per second stored for analysis

# Large Hadron Collider

# The Future at the High Luminosity LHC (HL-LHC)

Rate of collisions

Total data recorded

● Peak luminosity — Integrated luminosity

# The Future at the High Luminosity LHC (HL-LHC)

200 collisions in each bunch crossing

# Computing Demands of the HL-LHC

With current usage, would need more than about 5M cores by ~2035

R&D program to reduce compute needs by ~ x4

# Meeting the HL-LHC Challenge

## More efficient software & new methods

Computing resources used by each step

- Simulation
- Event generation
- Reconstruction of real data
- Reconstruction of simulated data
- Preparation of analysis data & analysis
- Other

Simulating the calorimeters is very compute-intensive.

Speed up with "FastCaloSim" 50

# Challenges for Analysis in the Future

Already facing **several bottlenecks**, expected more challenging the future

- Processing times – need to be fast

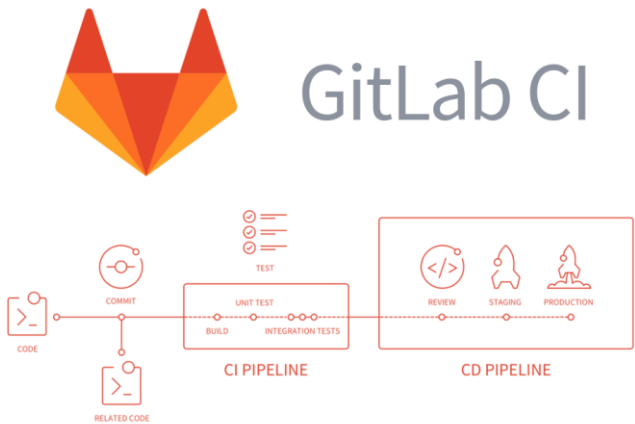

- Dataset sizes – need to be able to scale out

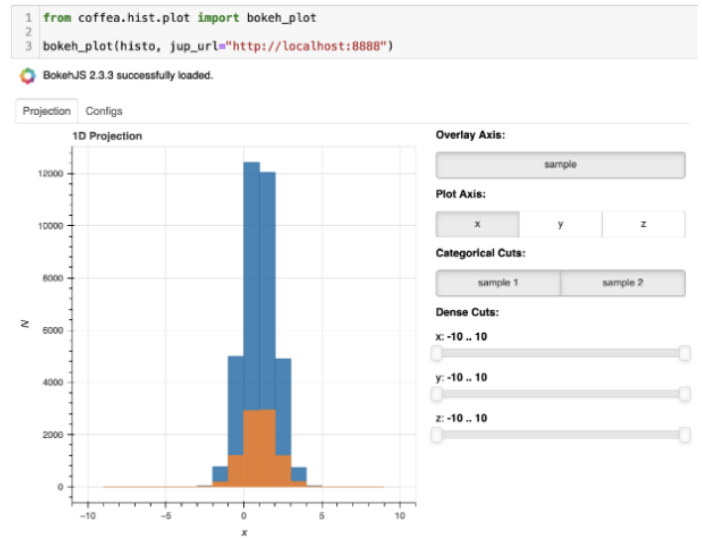

# Challenges for Analysis in the Future

Already facing **several bottlenecks**, expected more challenging the future

- Maintenance of code & ease of use

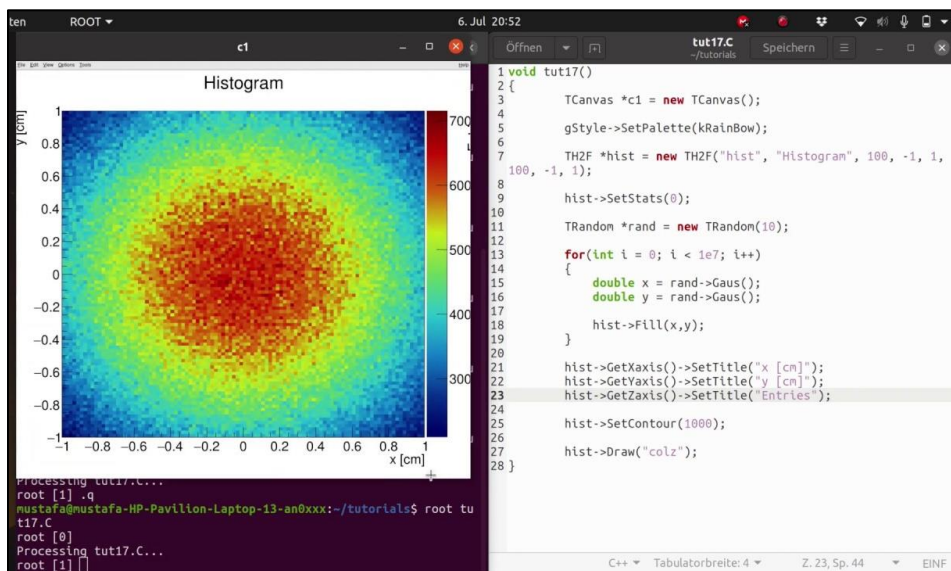

A screenshot of the JupyterLab web interface. The left sidebar shows a file browser with a list of folders and files, including 'analytics', 'data-image', 'data-science', 'gitlabds', 'propensity-to-buy', 'pyearth', 'www-gitlab-com', 'Modeling\_Process\_Kevin.ipynb', and 'Untitled.ipynb'. The main area shows a 'Launcher' panel with options for 'Notebook' (Python 3 and Template), 'Console' (Python 3), and 'Other' (Terminal, Text File, Markdown File, Python File, Show Contextual Help). A large green logo for the 'open source initiative' is overlaid on the interface.

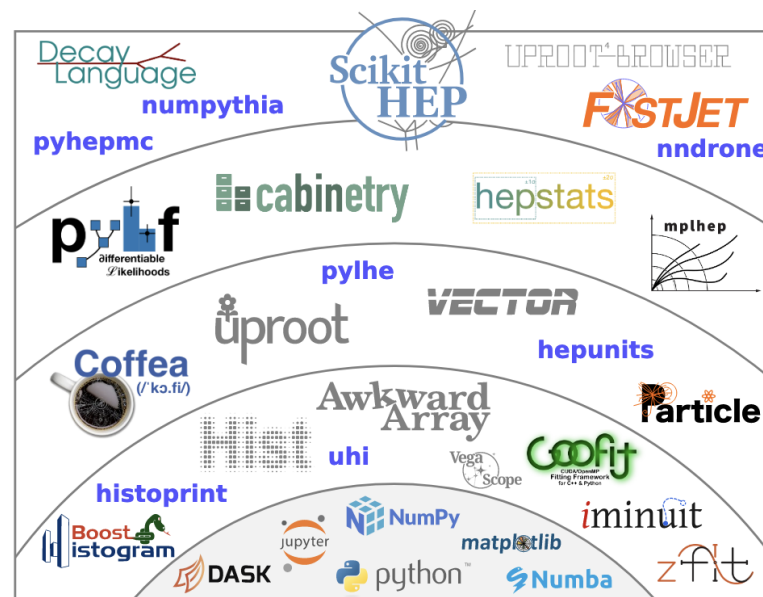

# Some History of Analysis Software

- Several scientific software toolkits have been used to deal with big data processing, storage, statistical analysis and visualization
- Increasingly modular, increasingly focused on **interoperability**

ROOT  
1994-Present  
C++ libraries  
can interface with python, R

Python Ecosystem Tools  
Python interfaces  
connected to developments in AI/ML  
and data science more broadly

# Increasing use of Python for Analysis

- Python has been in use for a long time for several purposes:
  - steering scripts, configuration-building, machine learning models, etc

Python is increasingly becoming a portal for analysis

– e.g. PyROOT + Scikit-HEP

# Multi-core processors

From the mid-2000s, multi-core processors became common. The cores share work between them to continue to allow increased performance.

# 48 Years of Microprocessor Trend Data

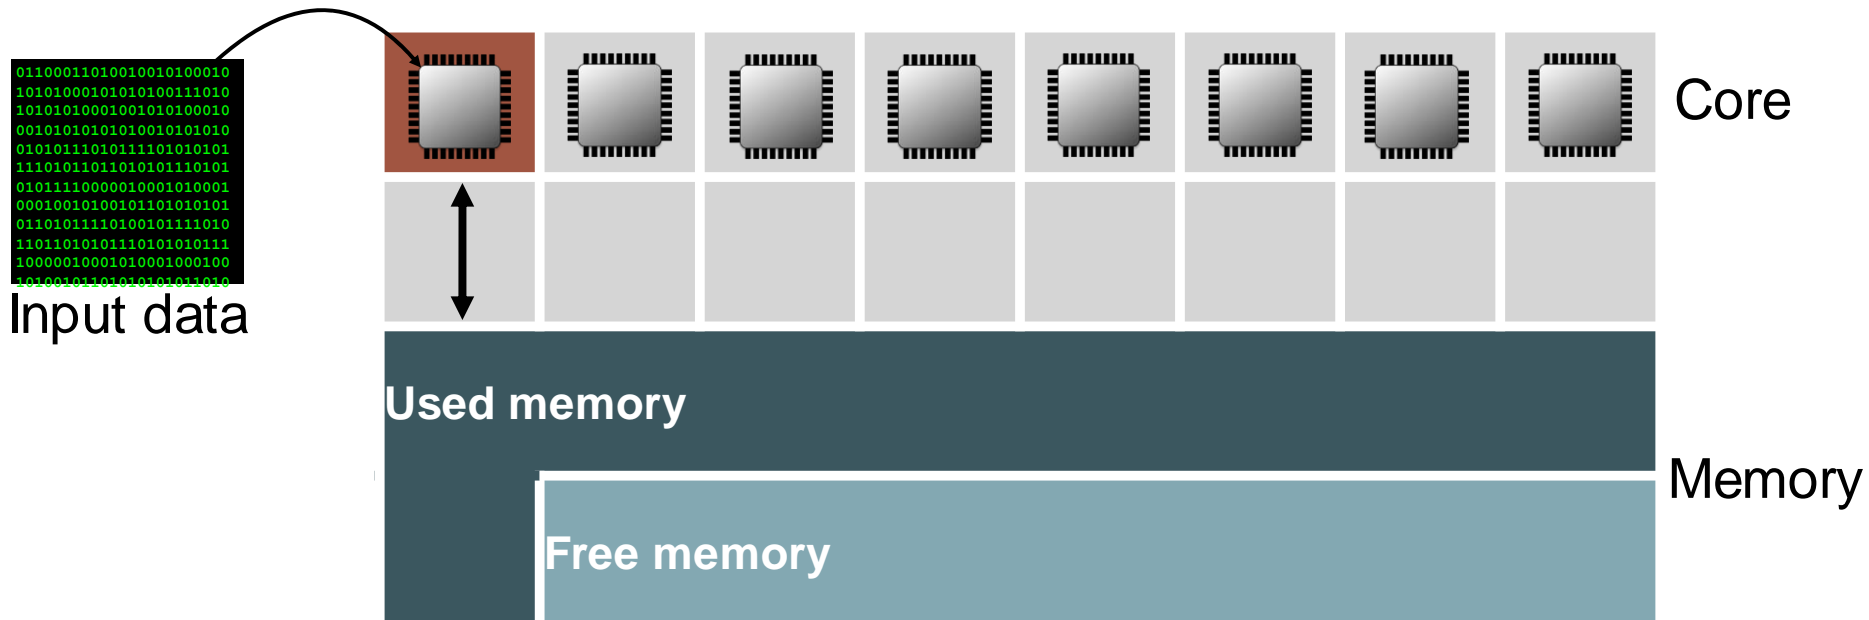

Original data up to the year 2010 collected and plotted by M. Horowitz, F. Labonte, O. Shacham, K. Olukotun, L. Hammond, and C. Batten  
New plot and data collected for 2010-2019 by K. Rupp

# Types of concurrency

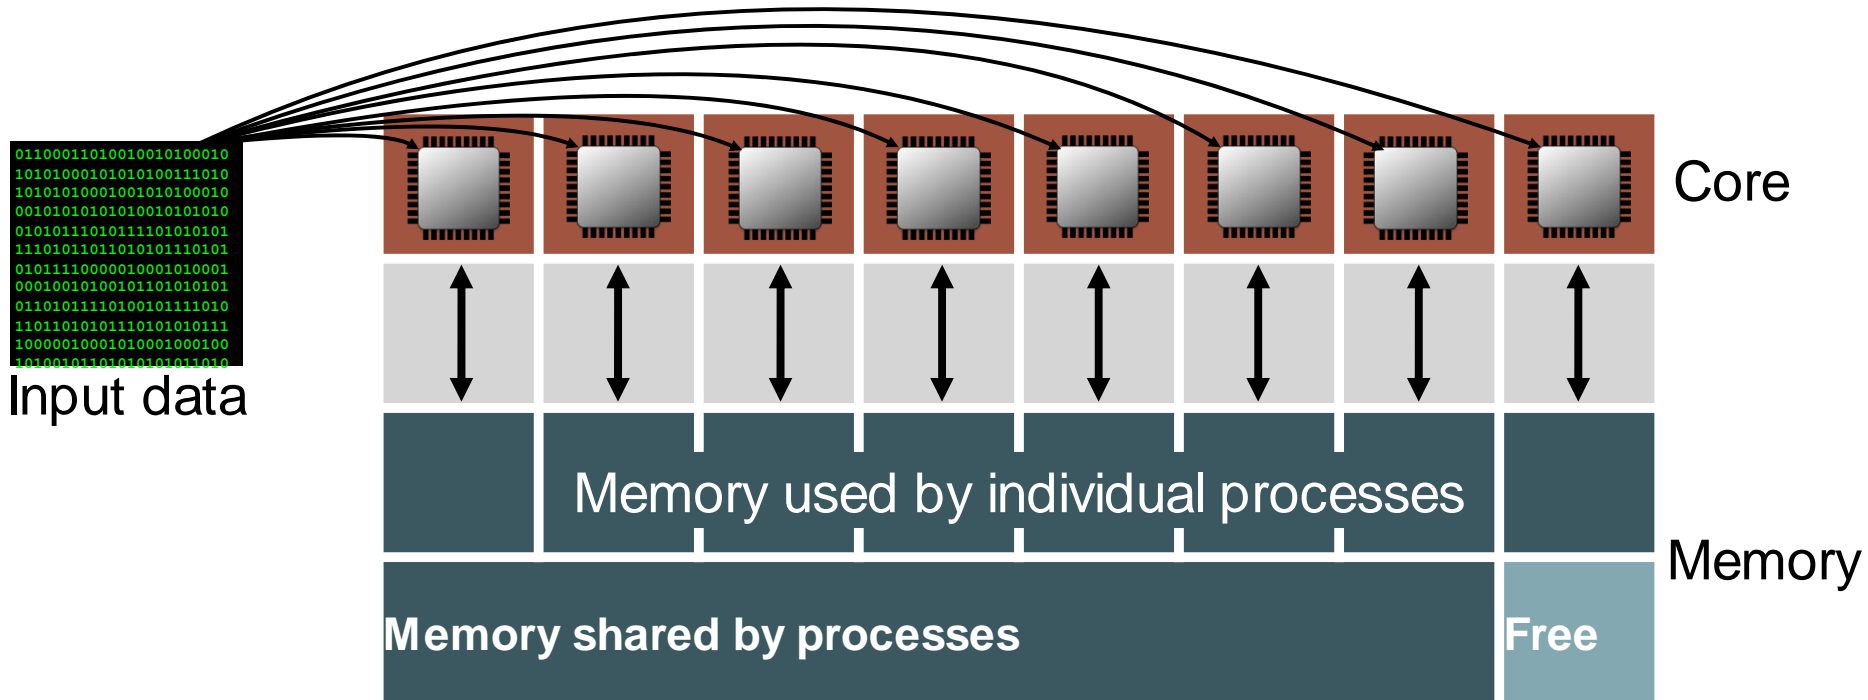

## Serial (e.g. no concurrency)

If no attempt is made to share the workload, **most of the memory is used by one core and the other cores can't be used**

# Types of concurrency

## Multi-process

Memory needed by all processes is shared at the start of the task. Each core runs an independent process that needs its own share of memory to handle its batch of events.

**Adding extra processes still adds a lot of extra memory**

# Types of concurrency

## Multi-threaded

Cores can share workload & memory throughout the task processing

*Adding extra cores costs very little extra memory*

This ensures the software is ready for data centers with more cores and less memory per core

# Meeting the HL-LHC Challenge

## Graphics processing units (GPU)

### CPU

- Small number of high power cores
- Optimized for complex serial tasks

### GPU

- Large number of low power cores
- Optimized for massively parallel tasks (e.g. graphics), machine learning

Memory

# Future Neutrino Experiments

# Outlook on Challenges of the Future

- Future experiment needs require changes in how analysis performed in the future, including:
  - More efficient software
  - Use more machine learning / artificial intelligence methods
  - New computational technologies (e.g. GPUs)
- Opportunity to leverage developments from broader data science community & the broader physics community
  - Synergies between high energy physics, nuclear physics & astrophysics communities

# Organizing the HEP community

---

The HEP Software Foundation facilitates cooperation and **common efforts** in High Energy Physics software and computing internationally.

- The HSF (<http://hepsoftwarefoundation.org>) was created in early 2015 as a means for organizing our community to address the software challenges of future projects such as the HL-LHC. The HSF has the following objectives:
  - Catalyze new common projects
  - Promote commonality and collaboration in new developments to make the most of limited resources
  - Provide a framework for attracting effort and support to Software & Computing projects
  - Provide a structure to set priorities and goals for work in common projects

# HSF-India Project

HSF-India is a 5 year project funded by the US National Science Foundation that aims to build international research software collaborations between US, European, & India based researchers to reach the science goals of experimental particle, nuclear & astroparticle research

<https://research-software-collaborations.org/>

- Given the growing complexity of our scientific data and collaborations, software collaborations are increasingly important to raise the collective productivity of our research community
- Intended as a long-term investment in international team science
- Funding available for
  - Fellowships
  - Researcher exchanges
  - Training events
    - including this event!

Princeton University: Peter Elmer, David Lange (PI)  
University of Massachusetts, Amherst: Rafael Coelho  
Lopes de Sa, Verena Martinez Outschoorn

# Analysis at the HL-LHC

- Analysis dataset size will increase substantially → challenge to process samples in a timely way
  - the time to process samples are a bottleneck, it is increasingly taking longer to carry out analysis
  - want to improve in the future reducing the processing time & using better tools
    - analyst time is critical
