Are we leaving no stones unturned?

- The LHC BSM searches are indispensable and should be continued in the new energy regime and with increasing statistics (higher mass, lower couplings)
- But are we looking at the right place and do we leave not stones unturned? -> Recent focus on long lived particles
- Time for more effort in thinking of complementary searches:
 -> What could the LHC miss with the present detectors?

Are we looking at the right place?

Long lifetimes in the BSM world

Any model with small couplings, small mass splittings, or decays via off-shell particles can result in long lived particles (LLPs)

Long Lived Particles

Long lifetimes arise from a hierarchy of scales or a small coupling

- RP Violating SUSY
- AMSB SUSY
- Gauge Mediated SUSY
- Split SUSY
- Hidden Valleys Models
- Dark QED/Dark Photons
- Magnetic monopoles
- Quirk Models
- Dark Matter Models
- Stable Sexaquarks
- Axion-Like Particles

Long Lived Searches: Examples

delayed jets

LLPs in muon system

displaced photons

Disappearing tracks

Small displacements

RPV searches

LLP Community Workshops

LLP Community White Paper: arXiv:1903.04497

New Experimental Proposals: Searching for Long Lived Particles

Long lifetimes arise from a hierarchy of scales or a small coupling

⇒ Opportunities for forward QCD measurements at the LHC and measurements of Cosmic Rays

New Directions for Experiments

Proposals for Transverse Detectors

New Transverse Experiment Proposals

MilliQan: searches for millicharged particles MAPP: MoEDAL upgrade FORMOSA: demonstrator

CODEX-b: searches for long lived weakly interacting neutral particles

Also: AL3X ('ALICE' for LLP arXiv.1810.03636).

MATHUSLA: searches for long lived weakly interacting neutral particles

ANUBIS A for in point of the second s

ANUBIS: searches for long lived weakly interacting neutral particles

~2020

+Recently (2021): a new detector for CMS cavern..

Particles with Milli-Charges?

"New" idea -> Hunting for particles with charges ~ 0.3-0.001e Baseline paper: arXiv:1410.6816 Proposal for a new experiment/CMS subdetector. Demonstrator (1%) taking data since mid-2017 till 2018

A Letter of Intent to Install a Milli-charged Particle Detector at

arXiv:1607.04669

LHC P5

Austin Ball,¹ Jim Brooke,² Claudio Campagnari,³ Albert De Roeck,¹ Brian Francis,⁴
Martin Gastal,¹ Frank Golf,³ Joel Goldstein,² Andy Haas,⁵ Christopher S. Hill,⁴ Eder
Izaguirre,⁶ Benjamin Kaplan,⁵ Gabriel Magill,^{7,6} Bennett Marsh,³ David Miller,⁸ Theo
Prins,¹ Harry Shakeshaft,¹ David Stuart,³ Max Swiatlowski,⁸ and Itay Yavin^{7,6}

Motivation:

"Dark QED" ie QED in the dark sector that kinematically mixes with the SM QED.
The EDGES anomaly...?

Detection technique: scintillators-> low light signals

MilliQan Experiment

Existing Wall

Existing Counting Roon

20 m

Millicharged Particles

Search for Millicharges: Particles with very small charges, compared to the electron, expected e.g. in Dark Sector theories.

Scintillator bar and slab based detectors +PMTs

MAPP/MoEDAL

MAPP is a detector for the upgrade of MoEDAL MAPP is a scintillator detector —like MilliQan— installed at CERN

MAPP is being commissioned for physics.

MAPP-1: DY only, 100% eff., no background milliQan: DY+meson decays, bkg.+detector eff. included FORMOSA-1: DY+meson decays, 100% eff., no background

400 scintillator bars (10×10×75 cm³) in 4 sections readout by PMTs
Protected by a hermetic VETO counter system

MilliQan: a new type of new physics hunter

- The idea of detector and the success of the demonstrator in 2018-• 2020 has led to new proposals for MilliQan-like experiments..
 - SUBMET: T2K 'neutrino' beam (mass< 2 GeV). Experiment installed and being comissioned right now. arXiv:2007.06329
 - MoEDAL/MAPP: @LHCb IP
 - FORMOSA: @FPF Cavern of the HL-LHC
 - FerMINI: FNAL fixed target experiment

- (Japan)
- arXiv:1909.05216 (CERN)
- (CERN) arXiv:2203.05090
- (USA) arXiv:1812.03998

E.G the SUBMET proposal (funded and approved in June '23; Installed '24)

MilliQan collaboration is involved in SUBMET, FerMINI & FORMOSA Detectors =>This is a science program for up to 2040 and beyond!!

CODEX-b

COmpact Detector for EXotics at LHCb: a dedicated LLP detector@ IP8

- Nominal design: $10x10x10m^3$ tracking volume 25 m away from the IP, preceeded by an active shield of $(25+5)\lambda$ Pb + 7λ concrete -> 1% angular acceptance
- RPC tracking detectors (ATLAS Phase 1 upgrade), integrated in LHCb triggerless readout -> Good vertexing and timing
- Modifications to the volume possible if DELPHI detector will be relocated

CODEX-β

Demonstrator to test technologies planned for CODEX-b

Integration with LHCb DAQ, measure backgrounds, develop & test reconstruction algorithms & simulation, + physics performance (but no shield)

- 2x2x2m³ cube in LHCb HLT D1 server room in Run 3
- 14 triplets of RPC designed for ATLAS Phase I upgrade of muon spectrometer. Cost O(200 kCHF)
 Expect 10⁷ K_L to decay in the demonstrator volume.
 Some reach for a search of multi-tracks (4+) LLP decays (appear eg in Hidden Valley models)
 - CODEX-beta for Run 3 progressing steadily
 - Ramping up hardware production and software activities
 - RPC assembly to begin next month
 - Investigating first toy data analyses

Detector being prepared to be installed this winter shutdown

ANUBIS

ANUBIS: searches for long lived weakly interacting neutral particles

AN Underground Belayed In-Shaft detector

ANUBIS changed from 'in shaft' to 'in cavern'

ANUBIS

ANUBIS: searches for long lived weakly interacting neutral particles

AN Underground Belayed In-Shaft detector

proANUBIS: A protoype in ANUBIS in the ATLAS cavern

- 2x1x1m³ test set-up deployed
- partial detector in 2028+, full detector in 2033+

Parameter	Specification
Time resolution	$\delta t \lesssim 0.5 \ { m ns}$
Angular resolution	$\delta \alpha \lesssim 0.01 \mathrm{rad}$
Spatial resolution	$\delta x, \delta z \lesssim 0.5 \ { m cm}$
Per-layer hit efficiency	$\varepsilon\gtrsim98\%$

MATHUSLA Rescoping

MATHUSLA: MAssive Timing Hodoscope for Ultra-Stable neutraL pArticles

Dedicated detector sensitive to neutral long-lived particles with lifetime up to the Big Bang Nucleosynthesis limit ($10^7 - 10^8$ m) for the HL-LHC

1806.07396

Proposed large area surface detector located above CMS with robust tracking and background rejection

- Large volume 40x40x16m³
- 4D tracking with ~ns time resolution
- Can run standalone or "combined" to CMS

MATHUSLA test stand

Aim to complete and submit CDR

New sensitivy studies being made

in 2025

Comparisons in Reach

Reach for H-> XX and X-> bb

Comparisons for MATHUSLA, CODEX-b and ANUBIS

More benchmarks comparisons expected for European Strategy input.. **Proposals for Forward Detectors**

New Forward Detector Proposals

FASER: searches for long lived dark photons-like particles, neutrinos

SND@LHC: neutrino measurements and long lived particle searches

Figure 5: Layout of the proposed SND@LHC detector.

FACET: Instrumented Beampipe for CMS

FPS: A Facility for Forward Physics Containing several experiments

FASER and SND@LHC have been approved in 2019/2020 and are taking data during Run 3

Forward Particle Production

Two New Detectors at the LHC FASER and SND@LHC

Neutrinos @ the LHC: SND@LHC & FASERv

SND= Scattering and Neutrino Detector

SND@LHC/FASERv are 480m forward and can study TeV-neutrinos with emulsion and tracking+muon/calo detectors

v_e and v_μ Interaction Cross Sections

First results in 2023: Direct observation of ν_{μ} neutrinos at the LHC!

2303.14185, 2305.09383

- Only small fraction of 2022 analyzed so far
- Candidate vertices reconstructed in emulsion films
 - Energy measurement (e) from shower multiplicity
 - Momentum measurement (µ) from track RMS (via Multiplescattering)

2403.12520

- Electron neutrino events observed: 4 (5.2σ)
- Muon neutrino events observed: 8 (5.7σ)

BSM Searches

FASER: Results on searches for ALPs and dark photons (decays)
SND@LHC: Sensitivity for light dark matter (scasttering)

 More channels to explore: Higgs-like scalars, Heavy Neutral Leptons, final state radiation effects, Quirks, LFV with tau excess, exotic interactions...

An Option for the FUTURE: The Forward Physics Facility

NEW: The Forward Physics Facility

Origin: Letter of intent contributed to the Snowmass21 process. Based on the FASER experience and studies: propose to have a Forward Physics Facility (FPF) experimental hall with room to include forward detectors for new physics searches (and QCD): FASER2, others

2203.05090

Phase Space Overview

More Neutrinos Experiments?

Instead of digging a new underground area.. Let the LHC neutrinos surface!And catch them with a detector, eg in Lake Geneva...

N. Kamp et al., CERN PBC Meeting Nov. 24

UNDINE: UNDerwater Integrated Neutrino Experiment

- A suite of CHIPS-style water Cherenkov detectors deployed in a modular fashion
- Benchmark lake detector: 5 CHIPS modules (~30 kT)

Non-Collider Experiments

- Neutrino Experiments
- Beam Dump Experiments
- High Intensitiy Experiments

Ongoing and planned projects: Belle-II, BES-III,NA62, NA64, MicroBooNE, T2K, DAMSA, Shiness, BaBar, LUXE, SUBMET, DarkQuest, LHCb-U1... See also C. Hearly

New: The SHiP Experiment

NEWS: March 24 CERN management selected SHiP as the experiment for the new beam dump facility for the CERN fixed target North Hall. SHiP foreseen to take data as of ~2030 for 15 years

CERN-SPSC-2023-

SHiP is ar⁰³³timized detector for searches for Feebly Interacting Particles (FIPS) such as:

- Axions/Axion-like particles
- Heavy Neutral Leptons
- Millicharged particles
- Dark Sector scalars
- Dark Photons
- Light Dark Matter...

SHiP will be a 15+ year program with a ~2 orders improved sensitivity compared to present experiments in the region of a few GeV

SHiP Physics Prospects

All plots are based on 6×10²⁰ PoT, and limits correspond to 90% CL, translating to 2.3 events in the absence of background

Neutrino Experiments Near Detectors

High intensity frontier for low mass particles with very weak couplings ->upcoming neutrino experiments (SBL, LBL) foresee very high intensity beams

ProtoDUNEs for BSM Searches?

arXiv:2304.06765

New Physics searches using ProtoDUNE and the CERN SPS accelerator

Pilar Coloma,^{1,*} Jacobo López-Pavón,^{2,†} Laura Molina-Bueno,^{2,‡} and Salvador Urrea^{2,§}

Use the ProtoDUNE detectors (700t LArTPCs) to hunt for weakly interaction LLPs or light dark matter scattering? The 'beam' comes for free!!

The T2 target in the North Hall "acts" like a beam dump for the 400 GeV SPS beam, and can deliver 3.5x10¹⁸ POTs/year

Experimental feasibility study ongoing...

Physics Beyond Colliders

Example: Heavy Neutral Leptons

Summary

- Clearly and increased interest in low mass/coupling and LLP searches at the LHC in CMS, ATLAS, LHCb, MoEDAL. Many analyses done or in are progress. No signal observed yet, but only top of the iceberg covered so far.
- New ideas for additional small experiments at the LHC to increase the coverage: MilliQan, MAPP, MATHUSLA, CODEXb, AL3X, ANUBIS, FACET.... LLPs also focus in the "Physics Beyond Collider" studies @ SPS (SHiP.... ProtoDUNEs?)
- New: FASER & SND@LHC Ready and take run 3 data
- Milliqan: Technology works: ->now several other proposals!
- European Strategy Updata for Particle Physics 2025/2026 will play a significant role in selecting/prioritizing
- If we would observe one significant anomaly ...

Backup

Long Lived Particles @ LHC

Examples of the distance travelled before decay in a central detector (example for ATLAS) depending on lifetime and kinematics

Long Lived Searches: Examples

Long Lived Particles @LHC

Signatures

Some of the Challenges

Triggers: Tracking detectors are powerful but difficult to use in trigger

SM backgrounds often low. But need special studies (punch through, secondary interactions, tails, cosmics...)

Special reconstruction is often needed

Some detector upgrades for High-Luminosity LHC (>2029) address these issues.

Developments @ LHC Analyses

- Triggers improvements:
 - Examples LHCb software trigger, displaced objects, timing, ... (see eg:2210.14675)
- Data collection improvements
 - Scouting of data & data parking techniques
- Analysis improvements
 - Better use of the detector capabilities, timing, LLP search in all subsystems eg muon system, new reconstruction methods, Machine Learning...
- Detector upgrades for HL-LHC:
 - Extended fast timing (4D reconstruction) and improved triggers (displaced tracks), smart FPGAs in DAQ...
- New/extended experiments @ LHC -> next

Example: Heavy Neutral Leptons

Neutrino portal: vMSM (Neutrino Minimal Standard Model) Minimal extension of the SM fermion sector by Right Handed HNLs: N1, N2, N3 Addresses the masses of neutrinos, baryon asymmetry and dark matter

Now we have LHC studies with displaced jets/lepton analyses with L~ 1m

Future LHCb Sensitivity

Dark photons: new muon and electron ID

- Better tracking-based muon ID massive improvement at low momentum
 - can be / going to be further improved with NNs
- Monotonic and fast Lipsitz NN for electron ID

The MoEDAL Experiment

...A search for Magnetic Monopoles and more...

MoEDAL

See talk J. Pinfold

LHCb

MoEDAL = ~ 75 physicists from 22 institutes and 11 countries -> MoEDAL is a passive detector, sensitive to new physics

Monopole search in heavy ion data using Schwinger model

MoEDAL is THE prototype of a small dedicated BSM experiment @LHC

Trapping Particles

arXiv:2110.13837

- Proposal for Detecting LLPs Trapped in detector material:
 - -> 2x2x2m³ dense target (rods), turned into a LAr calorimeter
- Sensitivity studied for e.g. R-hadrons

- Take the absorber apart (brass rods, 1cm x 1cm)
- Submerge into LAr, leave 1cm space between rods
- Apply voltage to each rod and attach readout electronics
 LAr calorimeter!

Trap the particles and wait for its decay Reach longer lifetimes: > weeks, months!

MATHUSLA Module 0

Proposal for MATHUSLA-10 (Canada)

- Dimensions ~10 x 10 m², H~flexible
- Prototype for the detector technology
- ► To be placed above CMS, and even as a standalone module can extend the LHC reach for LLP

- Manufacturing and operating the building blocks of the large scale detector.
- Exercise on real data: tracking, efficiency and • timing resolution using CR, at UofT.
- Characterize "beam-associated backgrounds" (rare SM particles in HL-LHC by operating at CERN P5 during LHC runs.

FACET

History of FASER and SND@LHC

- FASER: proposed in 2018
 - Approved in 2019
 - Partially using spare parts from ATLAS and LHCb
 - Partially "private" sponsored (Simons Foundation)
 - Passive Neutrino added in 2019 (FASERnu)
 - Construction started 2020/finished 2021
- SND@LHC: proposed in 2020
 - SND detector technology partialy based on SHIP proposal
 - TDR end of 2020. Approved March 2021
 - Construction started 2021/finished 2021!!

Both experiments were ready to take data in Run 3 in May 2022!

Neutrinos from the LHC

Direct Neutrino observation by SND@LHC and FASER

Neutrino observation with electronic detectors

- Analysis strategy:
 - Full Run 3 2022 dataset, 39 fb⁻¹
 - Observe v_{μ} Charged Current interactions with electronic detectors only
 - Maximise S/B, counting-based approach
 - ~10⁹ muon events: apply cuts with a strong rejection power to reach a negligible background level

- Observed v_{μ} candidates: 8 (expected 5)
- Preliminary estimate of background yield: 0.2

SND@LHC:2305.09383FASER:2303.14185

Neutrinos at the LHC

Cross section/neutrino energy

- Highest neutrino energy made by man-kind
- Behavior of neutrinos at TeV energies?
- Lepton Universality in neutrino scattering?
 - v_{τ} and heavy quarks \rightarrow Flavor anomaly e.g. R_D
- Any new physics effects at high energy?

FASER: Axion-Like Particle Search

Mainly from B decays

- Currently sensitive to axion-like particles (ALPs) coupling to SU(2)_L gauge bosons
- Signature:
 - decay a-> $\gamma\gamma$ with >1 TeV in calorimeter
 - No signal in veto counters
 - In time with LHC collision
 - Background dominated by neutrinos interacting in the detector material!

1 event observed / 0.4 +/- 0.4 expected

CERN-FASER-CONF-2024-001

FACET

Dark Photons

Mingxuan Du, Rundong Fang, Zuowei Liu and Van Que Tran, Enhanced long-lived dark photon signals at lifetime frontier detectors, arXiv:2111.15503v1 [hep-ph] 30 Nov 2021

Experimental Technqiues

FASER and SND@LHC

Experiments to search for forward produced LLP (ALPs, Dark Photons, DM...) and neutrinos

Light Long Lived Particles

There are light long-lived particles in the SM: muon, pion, kaon, neutron ... many BSM scenarios also include (light) long-lived particles

Example: dark photon

similar to the SM photon but with mass mA' and couplings to SM particles suppressed by ϵ

$$\mathcal{L} = \frac{1}{2} m_{A'}^{2} A'_{\mu} A'^{\mu} + \sum \bar{f}(i \not\partial - \epsilon e q_{f} \notA') f$$

FASER: Dark Photon Search

• Signal: $\pi/\eta \rightarrow A'\gamma$ or $pp \rightarrow ppA'$, A' travels 476 m through rock/concrete, then decays $A' \rightarrow e^+e^-$. Probes thermal target: m ~ 10 – 100 MeV, $\varepsilon \sim 10^{-5} - 10^{-4}$.

- After unblinding, no events seen in signal region. Background ~ 10⁻³ events, FASER sets limits on previously unexplored parameter space.
- First incursion (with NA62) into the thermal target from low coupling since the 1990's.
- Background-free bodes well for the future: FASER2 has ~60,000 better sensitivity.

PLB 848, 138378 (2024)

NEW: The Forward Physics Facility

Originally for searches for New Physics

2203.05090

Extended to cover Neutrinos, QCD, Astroparticle Physics, Dark Matter Searches

QCD: PDFs, very forward production of light and charmed mesons, very low-x (10^{-7}) and very high-x regions eg intrinsic charm, v-DIS...

Neutrino: TeV scale neutrinos, about 1000 Tau neutrinos, tau and anti- neutrino separation...

Astroparticle physics: improve the modelling of high-energy hadronic interactions in the atmosphere. Help to understand the atmospheric neutrino flux

Timeline: a proposal for Run4 starting ~ 2030

FLArE

Forward Liquid Argon Experiment (FLArE)

- FLArE: a liquid argon time projection chamber (LArTPC) detector in FPF to detect neutrinos and dark matter from LHC
 - Fiducial mass of 10 tons (1x1x7 m³) is needed for good statistics and sensitivity to dark matter
 - · Detector needs to have good energy containment and resolution for neutrino physics
 - Muon and electron ID. Very good spatial resolution (~1 mm) for tau neutrino detection
