

Search for Higgs Pair Production Decaying into 2 Photons and 2 b Quarks at the High-Luminosity LHC

Friday 16 May 2025 09:20 (15 minutes)

The Standard Model (SM) is currently the most predictive framework for describing interactions among the fundamental constituents of matter. It includes 19 free parameters, which are measured experimentally, notably with the ATLAS detector at the Large Hadron Collider (LHC) at CERN. These parameters encompass particle masses, phases, and coupling values. One of these couplings, the Higgs boson self-coupling, stands out due to its unique nature: Only a scalar can possess a self-coupling, and it is a key parameter in shaping the Higgs potential, explaining the origin of particle masses. Hence, precisely knowing the value of this coupling is crucial, either to strengthen the predictive power of the SM and constrain the shape of the Higgs potential, which has a direct impact on the stability of our universe, or to open the door to new physics. This coupling is involved in the simultaneous production of two Higgs bosons via a virtual Higgs boson, a rare process with a cross-section 1,000 times smaller than that of single Higgs boson production. This process presents a detection challenge, as the two Higgs bosons decay into various types of particles with different probabilities. A particularly sensitive signature for this measurement is the decay of a pair of Higgs bosons into two b-quarks and two photons ($HH \rightarrow b\bar{b}\gamma\gamma$). Although currently limited by the amount of data collected, this analysis has provided the best existing constraint on this value. An upgrade to the LHC, called the High Luminosity LHC (HL-LHC), aims to increase the data produced by a factor of 20 compared to the current measurement. A sensitivity projection study for this coupling measurement allows us to determine the expected constraint at the end of the HL-LHC program, based on the latest Run 2 legacy results provided by ATLAS (JHEP 01 (2024) 066). Moreover, this channel will play a major role in the combination with other channels as well as the one with CMS, providing the most precise measurement of the self-coupling and paving the way for the discovery of Higgs pair production.

Author: LAFARGE, Arthur (Université Clermont Auvergne (FR))

Co-author: TANAKA, Reisaburo (IJCLab, Université Paris-Saclay (FR))

Presenter: LAFARGE, Arthur (Université Clermont Auvergne (FR))

Session Classification: Parallel

Track Classification: Non-resonant HH and self-coupling
