

Cryogenic SiPMs for the optical readout of DarkSide-20k

Giuseppe Matteucci

on behalf of the DarkSide-20k Collaboration

University of Naples Federico II, Istituto Nazionale di Fisica Nucleare, Sezione di Napoli

The DarkSide-20k Experiment

- In construction at Hall C of LNGS (3800 m w.e.)

Outer Veto

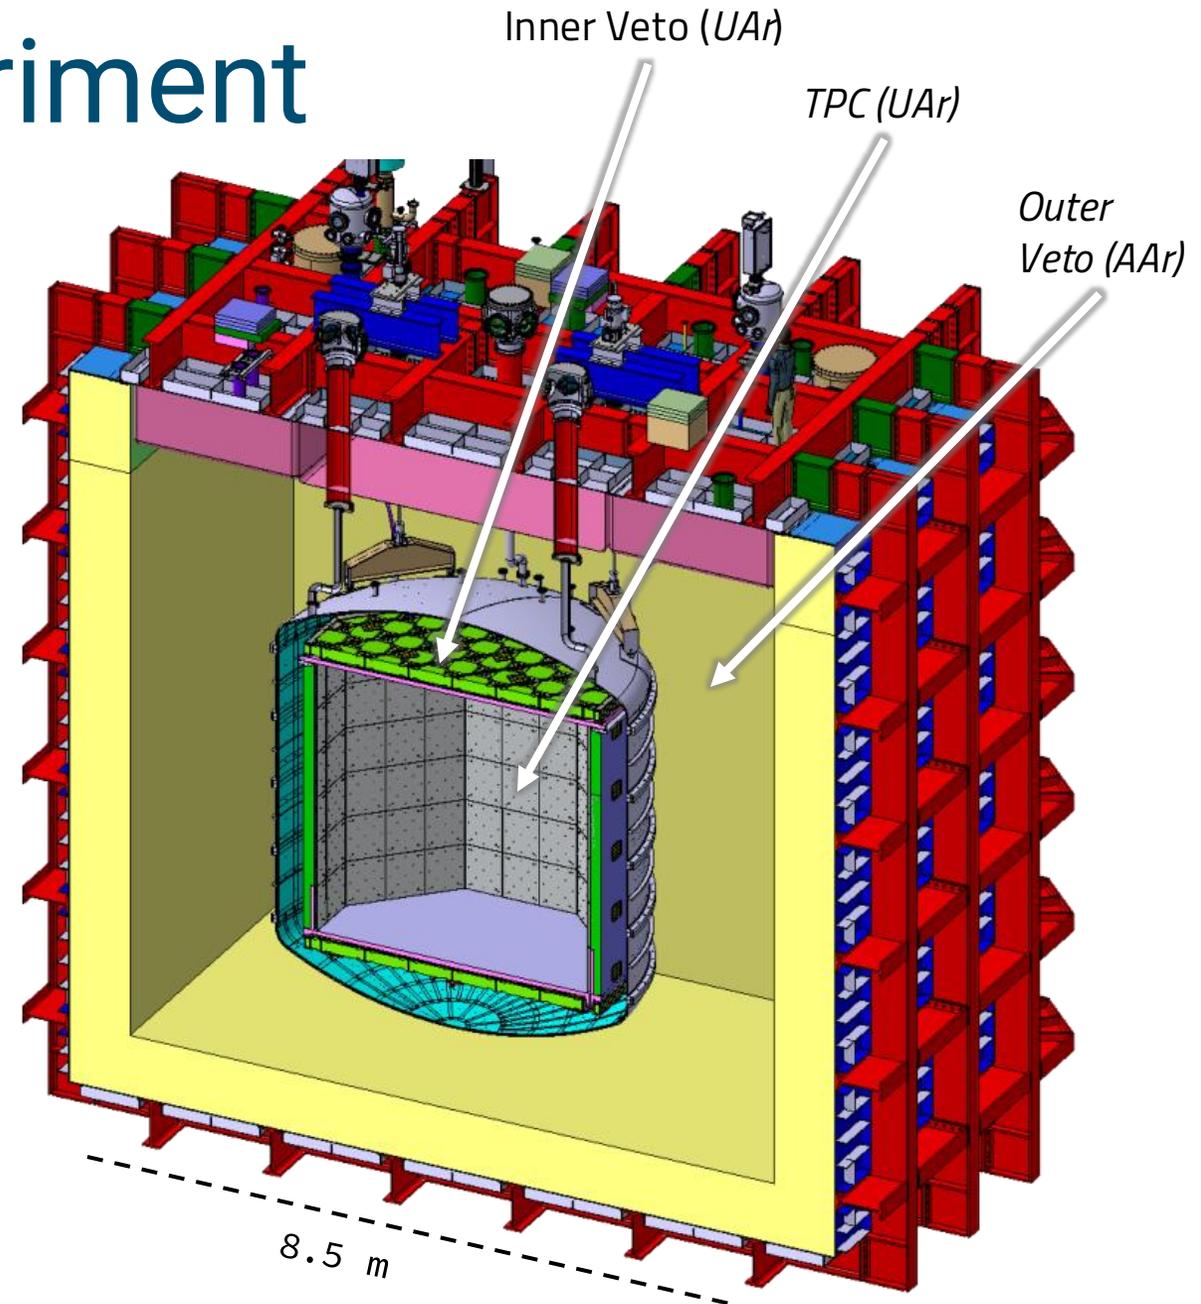

Muon veto
ProtoDUNE-like membrane cryostat 8x8x8 m³

Inner Detector

Contained within a stainless steel vessel
100 t of UAr (including TPC UAr)

1. Two-phase Ar TPC
2. Veto

- Target background < 0.1 (excluding neutrinos) in 200 t yr

The two-phase TPC of DS-20k

DarkSide-20k TPC:

Walls:

- PMMA
- ESR Reflector
- TPB wavelength shifter

Top and bottom Plates:

- PMMA
- TPB wavelength shifter
- Optical planes comprised of SiPM photo-detector units

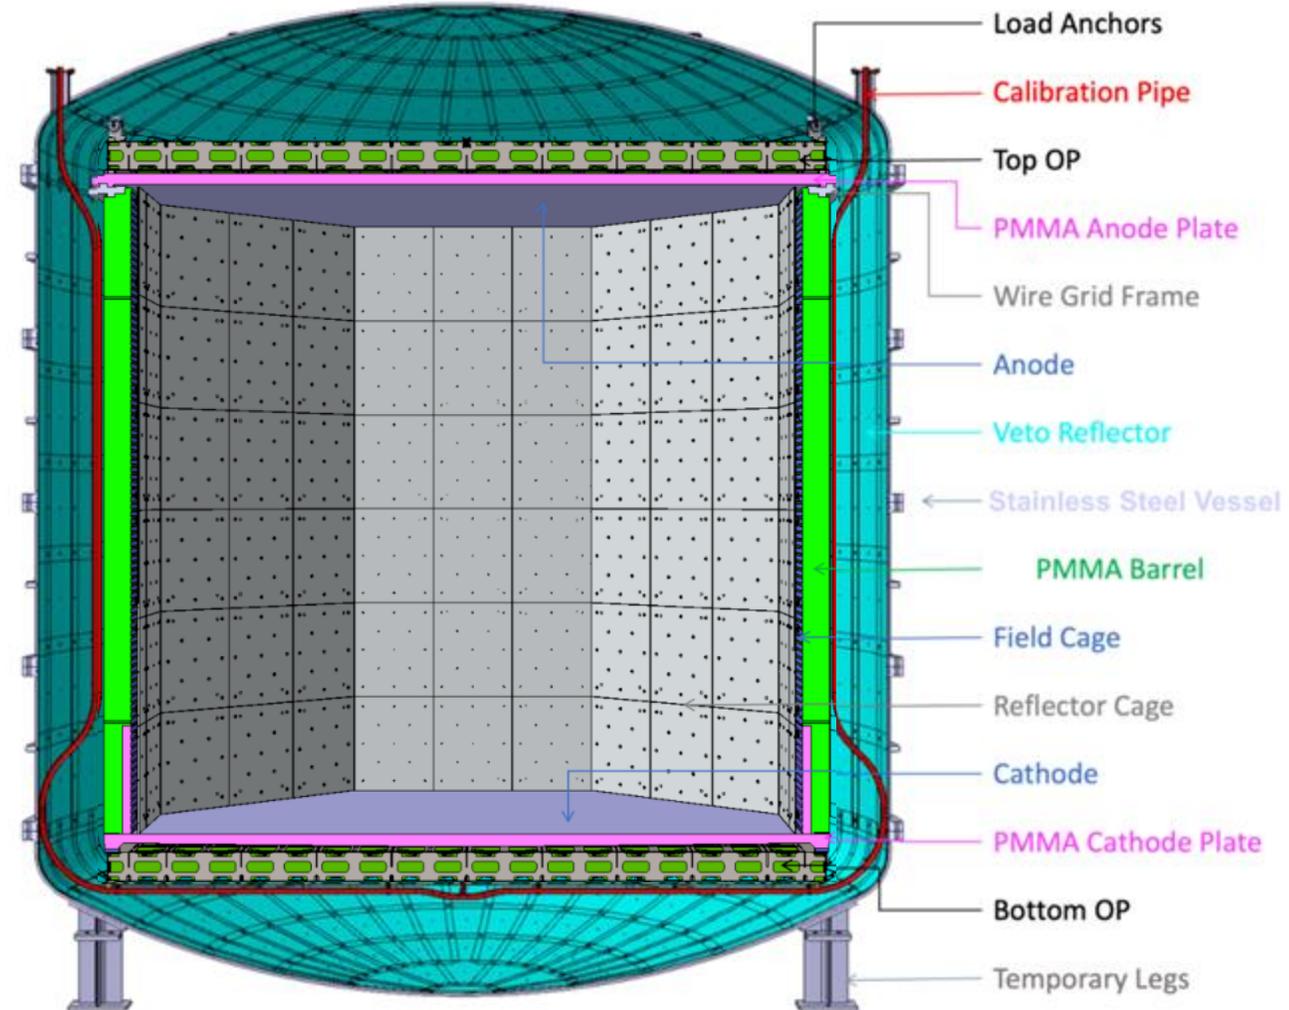

Fields:

- Clevios coating for Anode, Cathode, Field Cage
- Wire grid of stainless steel

Drift length = 348 cm

Active UAr mass in TPC = 49.7 t (20 t fid.)

Spatial resolution: $xy < 5$ cm, $z \sim 1$ mm

Light readout of DS-20k

TPC:

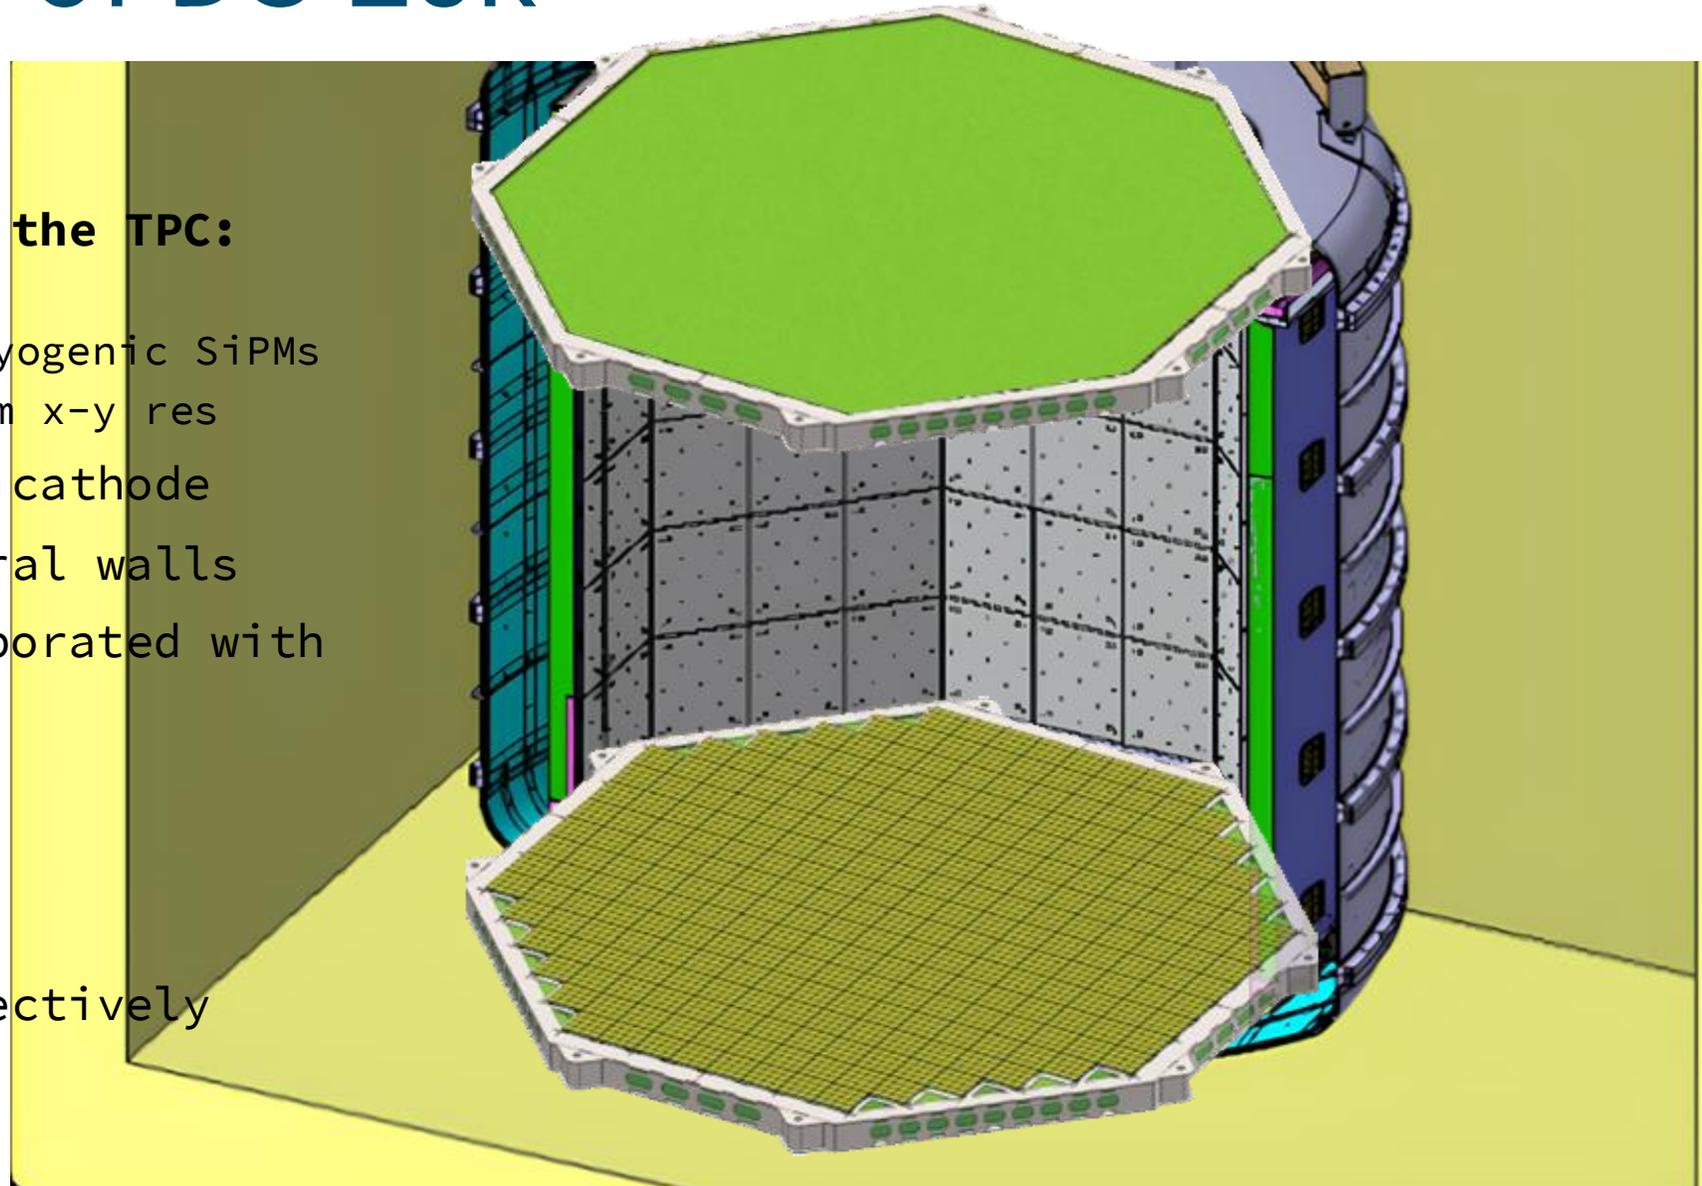

- **Two optical planes of the TPC:**

- 21 m² in total
- ~100% coverage of cryogenic SiPMs
- 2112 channels, < 5 cm x-y res

- Transparent anode and cathode
- ESR reflector on lateral walls
- Internal surfaces evaporated with TPB

Inner and outer veto:

- Same SiPM technology
- 512+128 channels respectively
[~(5+1) m²]

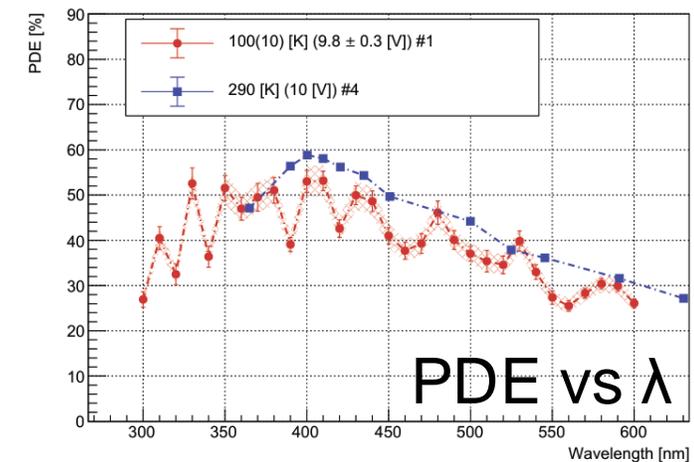

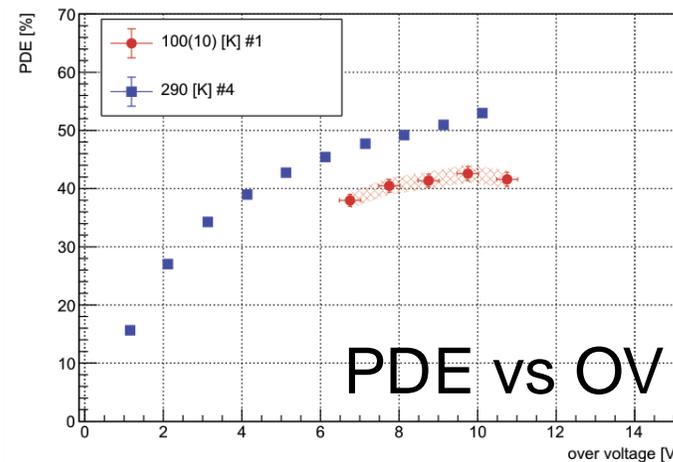

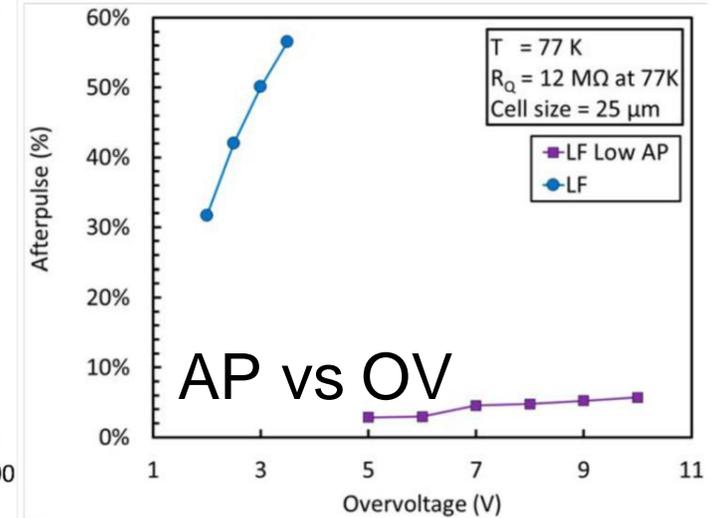

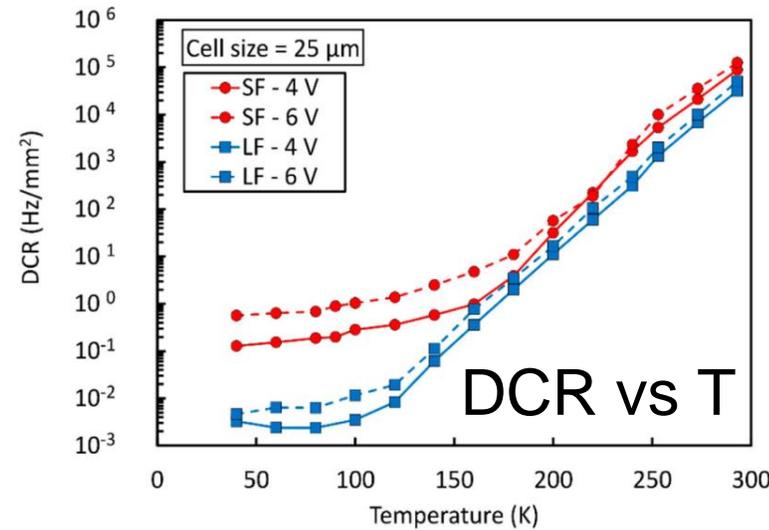

Cryogenic SiPMs

NUV-SiPMs in Liquid Argon

NUV-HD-CRYO by FBK:

- Reduced DCR (up to 10^{-6} with respect to 300K)
- ~~Increased After Pulsing~~
→ *Low AP Technology*
- ~~Increased Quenching Resistance~~
→ *PolySi resistor with limited temperature dependance*
- Never used in long-exposure experiment → *prototyping and testing*
- *Require wavelength shifter*
- Technology for DS-20k developed by Fondazione Bruno Kessler (FBK)
- Mass production by LFoundry

SiPM Tile (PDM)

Objective:

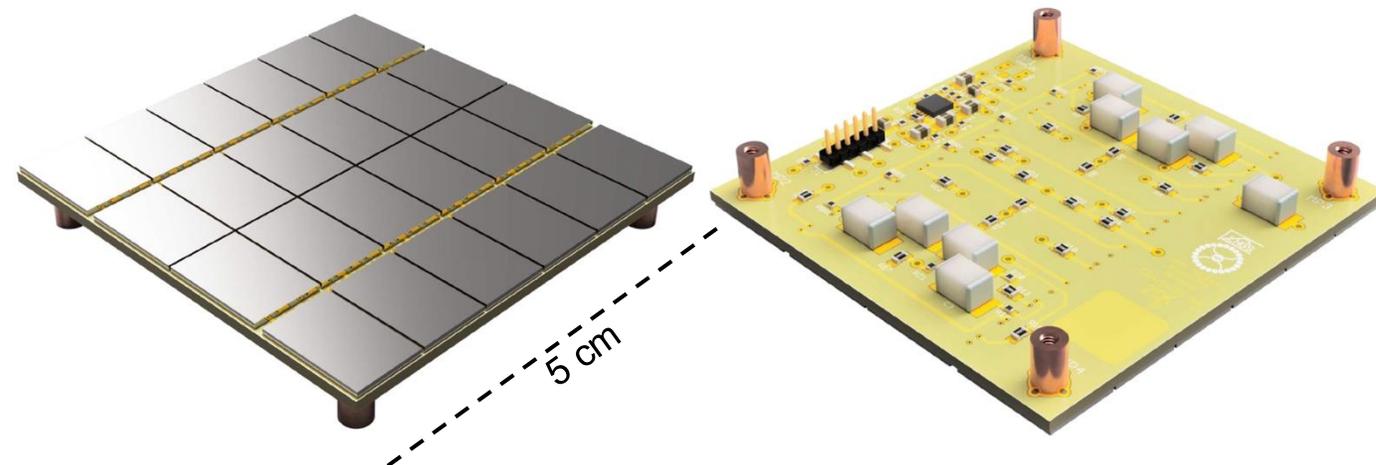

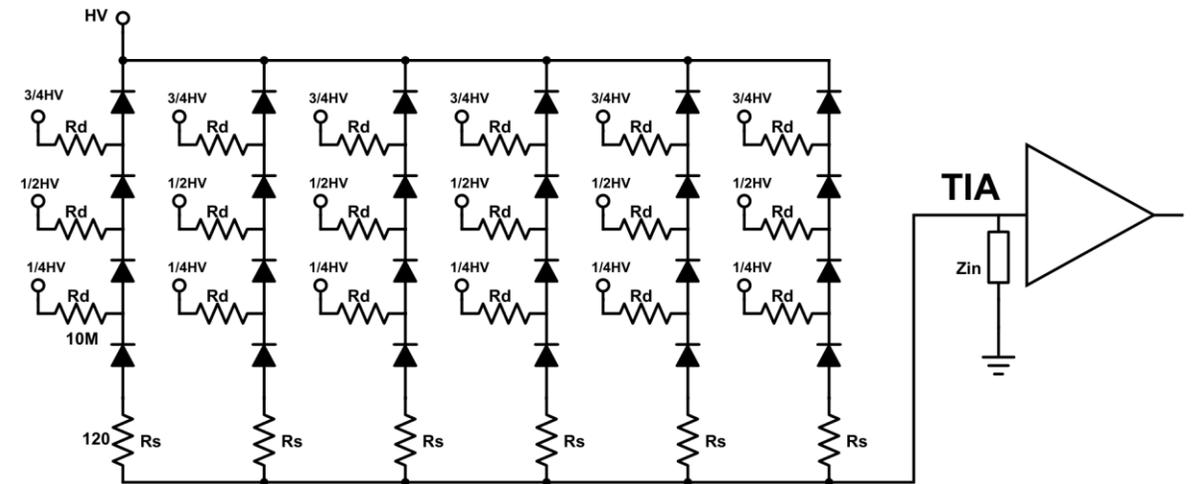

- Large Area SiPM Array
- Low Noise

Result of R&D: PDM Tile

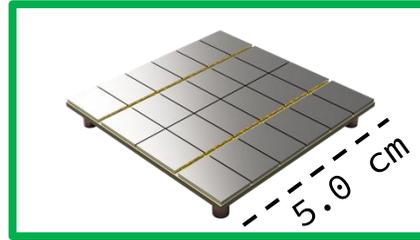

- Electronics: Fast Cryogenic Trans Impedance Amplifier (Noise $\propto \sqrt{C_i}$)

SiPM Ganging:

- Many SiPMs in parallel: High C_i
- Many SiPMs in series: Low current
- Compromise: 6p4s configuration
- Precision voltage partitioner to bias the SiPMs

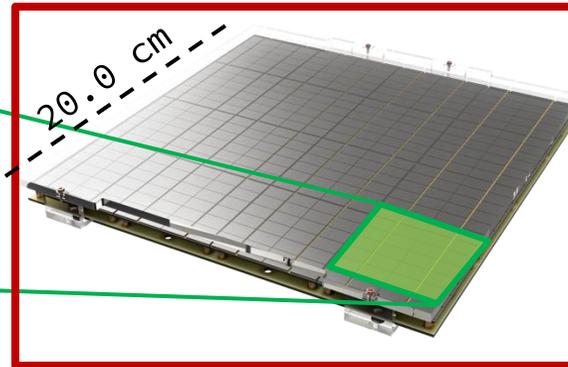

The PDU

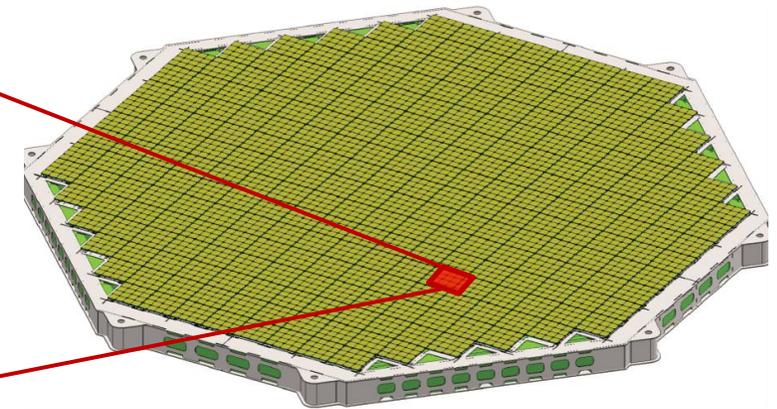

Tile: 5x5 cm²

24 SiPMs directly mounted on a FEB
SiPM: NUV-HD-CRYO developed by FBK and
produced by LFoundry

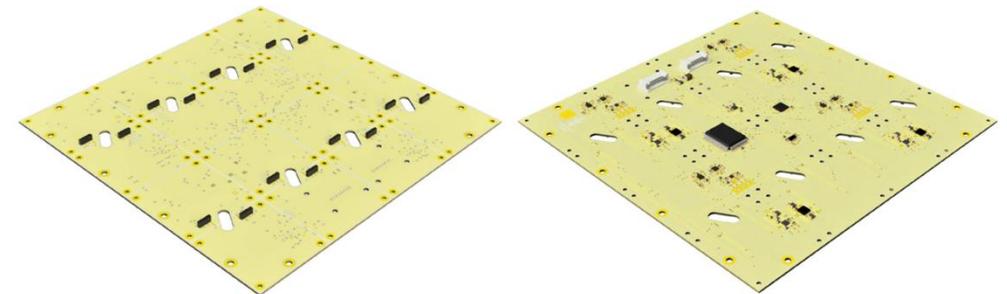

PDU: 20x20 cm²

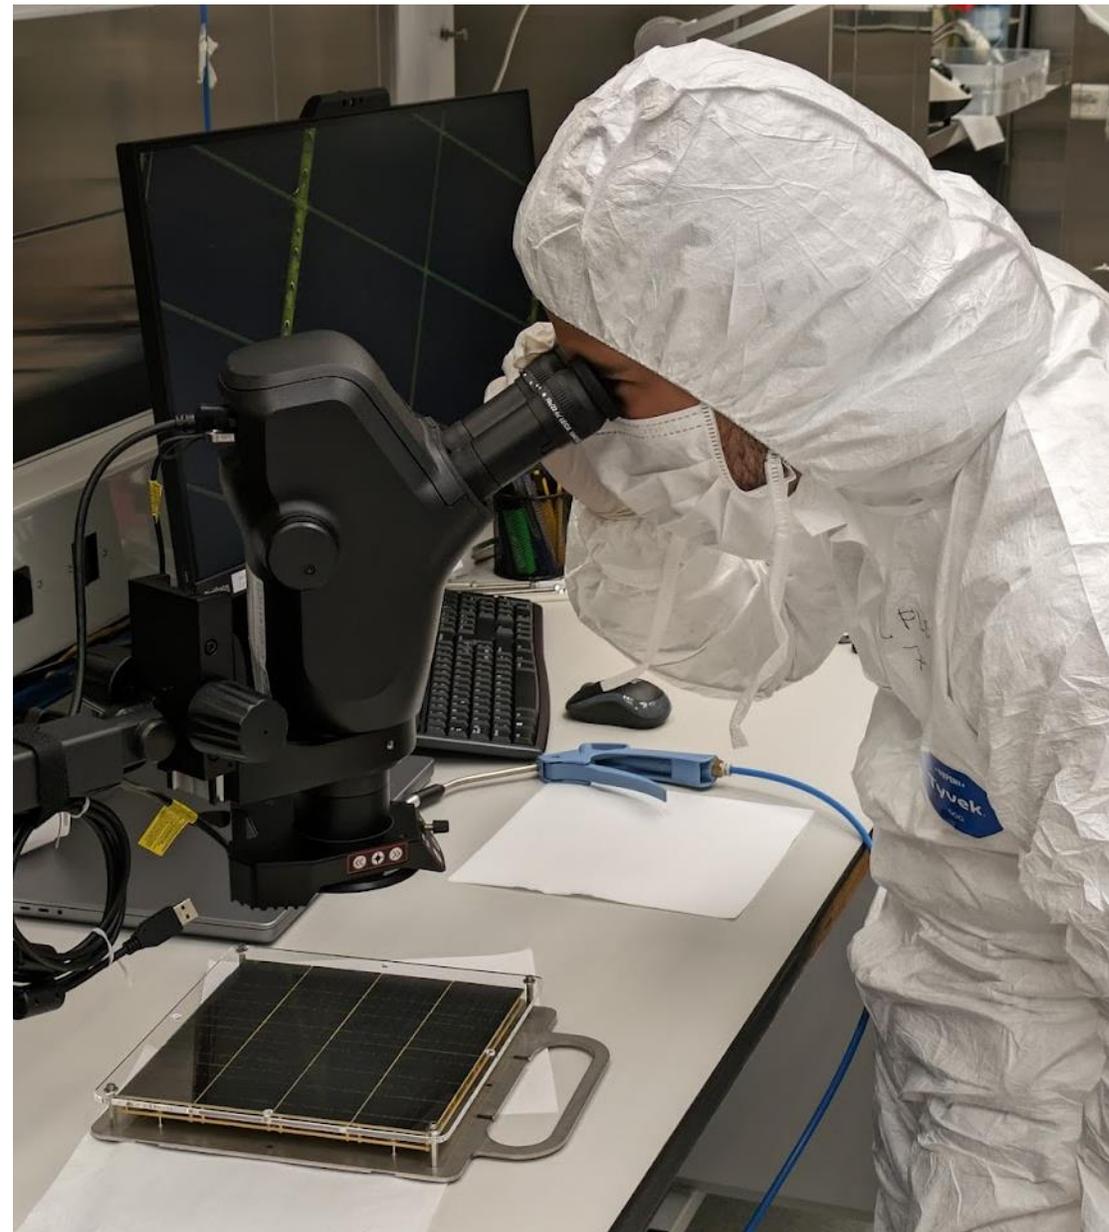

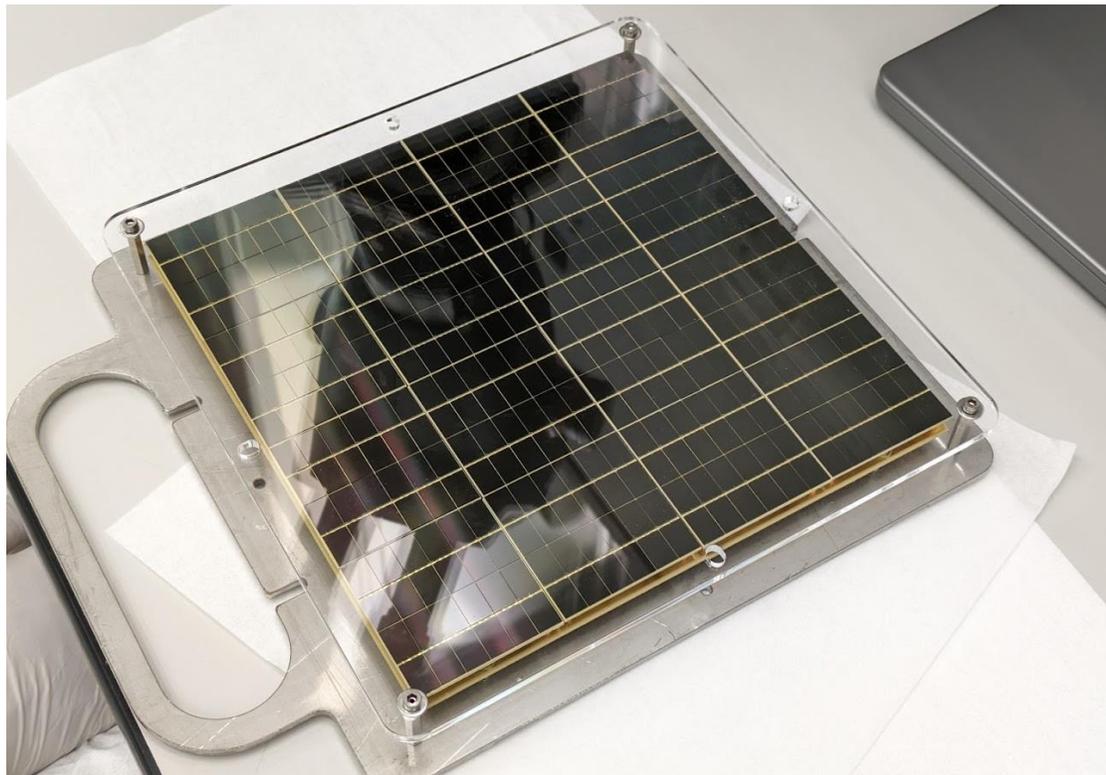

16 Tiles Assembled on a Motherboard
4 readout Channel

Optical planes: ~2x10 m²
Total PDUs used (TPC): 528
Readout Channels: 2112

- A Motherboard which houses 16 Tiles →
 - Active adders sum tiles in groups of 4
 - Differential transmitter → 4 Readout CHs
- A power Magement Unit allows for remote switching of HV and LV for **each tile independently**
- ~1.8 W consumption in LN

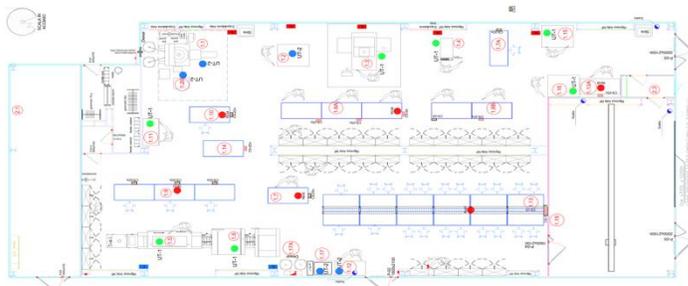

NOA Production Facility

Presentation by L. Consiglio at TAUP23

Nuova Officina Assergi

- IS06 Clean Room
- 420 m²
- Continuous Rn Monitoring
- CR3 Equipped with:
Cryoprobe, Dicer
Chip Bonder, Wire Bonder
Microscopes, Packaging
Tools
- PDU Production

PDU Test Facility in Napoli

Balmforth et al. - 2023 JINST 18 C03024

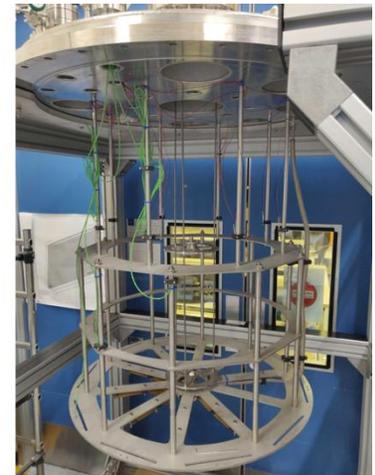

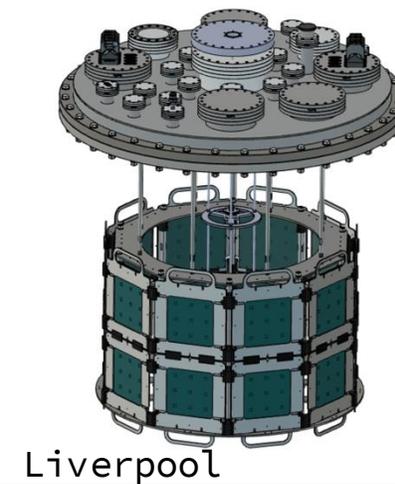

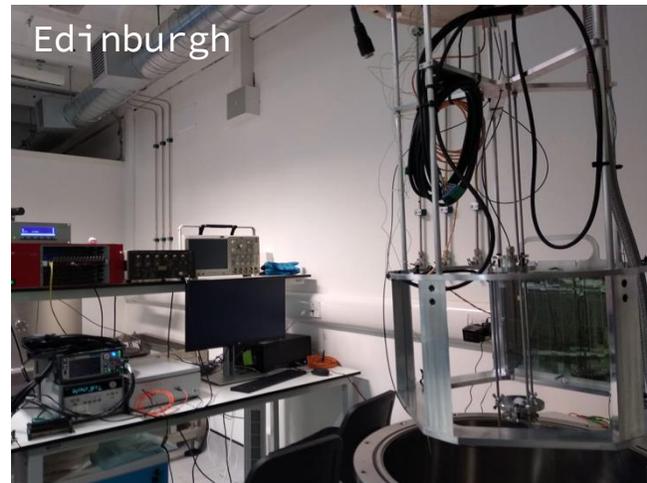

- ~800 L double wall **cryostat** with domed flange
- ~100 ps pulsed **laser for calibration**
- Readout of up to 16 PDUs (64 CHs) with CAEN VX2740 ADC

- Custom support structure with room for 16 PDUs inside the cryostat
- Custom illumination system with PMMA rods as diffusers
- High end local servers for DAQ and Acquisition with 0(1 PB) storage

- MIDAS DAQ Framework
- Fully automated cold box, remotely controllable with fast FILL and DRAIN
- Two external 3000L each reservoirs
- Already testing pre-production

Veto PDU Facilities

Production in Birmingham, STFC interconnect, Manchester, Liverpool → Testing Facilities

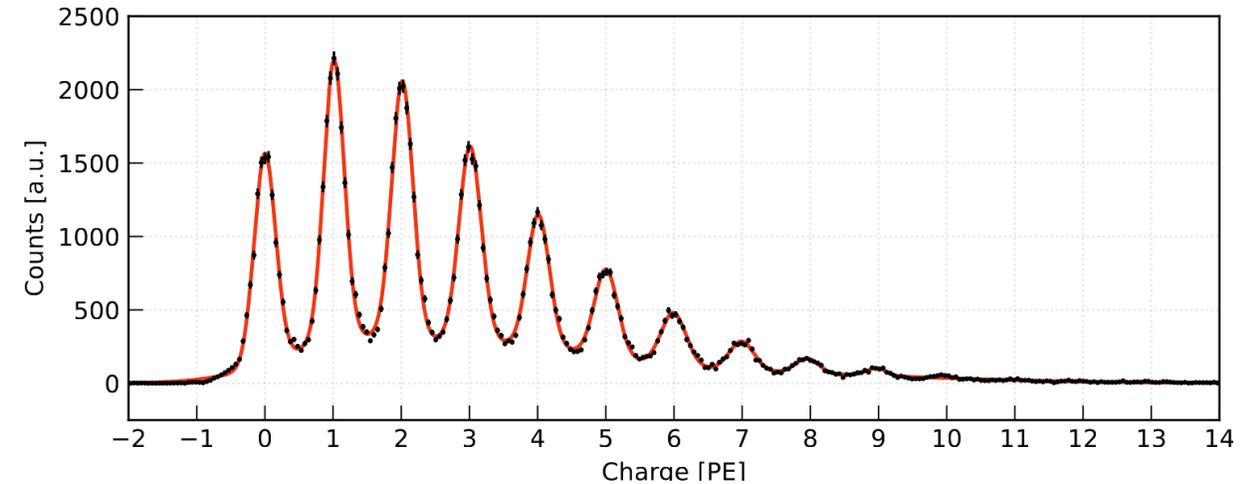

PDU: Laser Calibration and SPE

S. Vinogradov et al. 2009 IEEE NSS/MIC
2009 1496-1500

Performance Study in LN2

- Varying overvoltage
- Long term testing

At 7 V o.v. 77 K

Single PE response (SPE)

SPE = 6.76 mV· μ s

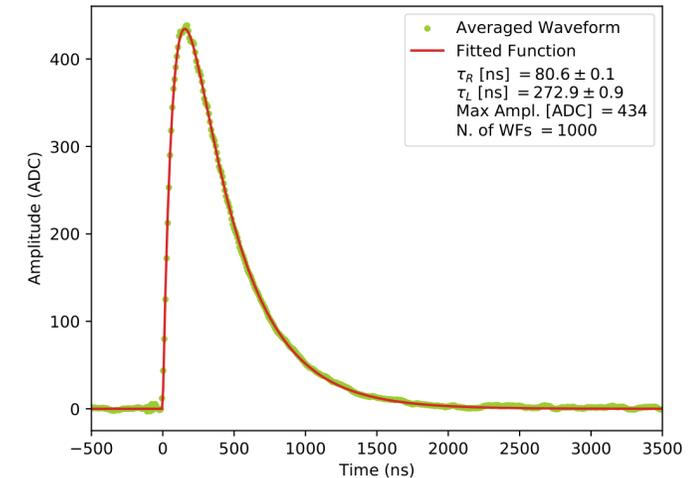

Waveform Template

For matched filter

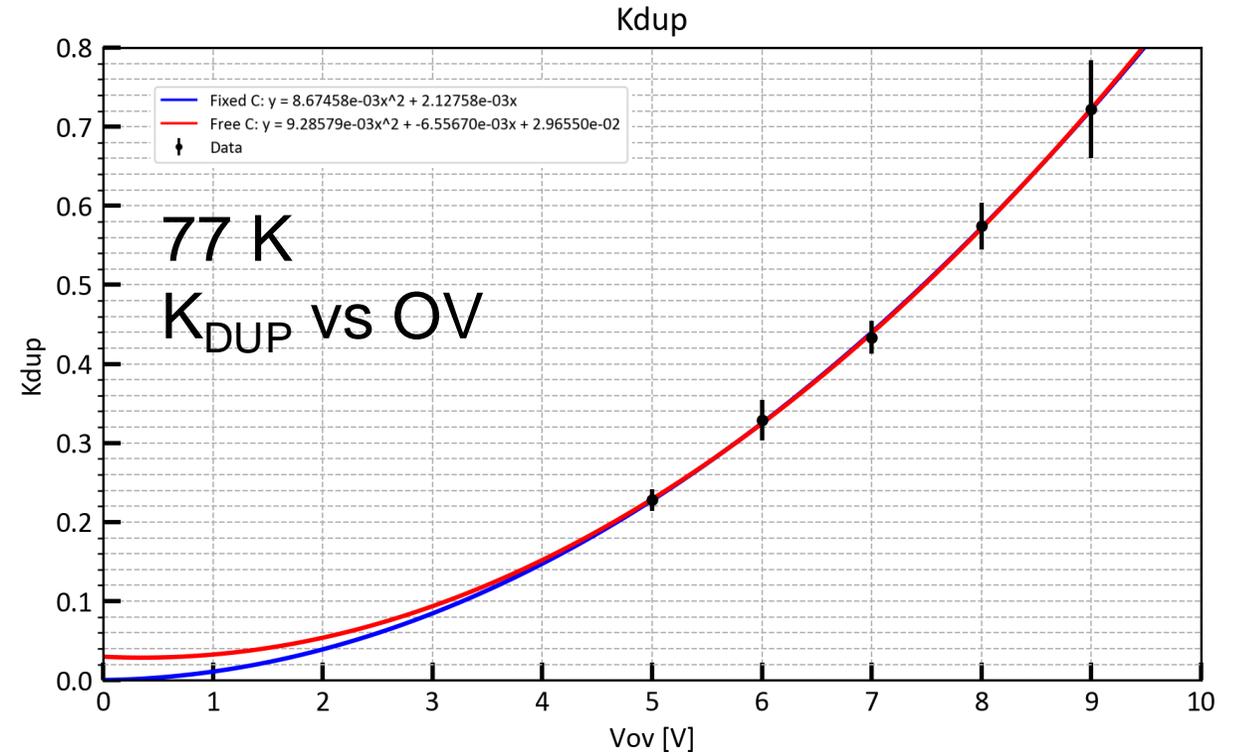

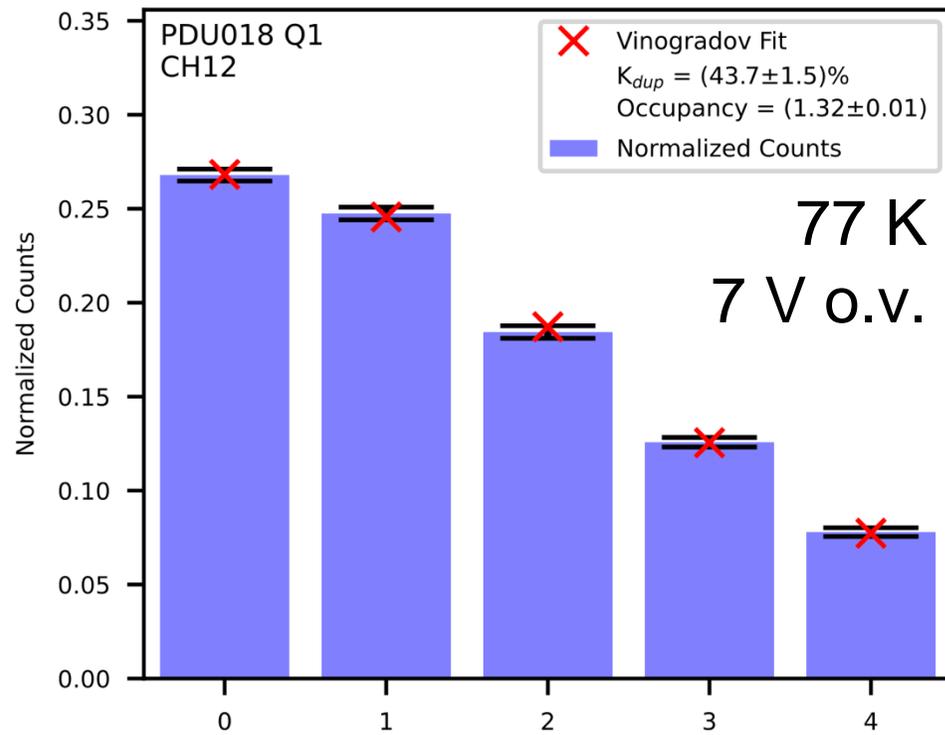

$$V(t) = A \left(e^{-\frac{t-t_0}{\tau_L + \tau_R}} - e^{-\frac{t-t_0}{\tau_R}} \right) \Theta(t - t_0)$$

1 PE Ampl. = 12.5 mV

Fall time = 350 ns

PDU: Correlated Pulses

(one method for) Quantifying and monitoring Additional Correlated Pulses

K_{DUP} = Average number of correlated additional hits with respect to true photon hits
In a compound poissonian regime (Vinogradov model)

$$N_{hits} = N_{true}(1 + K_{DUP})$$

$$K_{DUP} = \sim 45\% \text{ @ } 7 \text{ V o.v.}$$

PDU: SNR, resolution, gain

Definitions

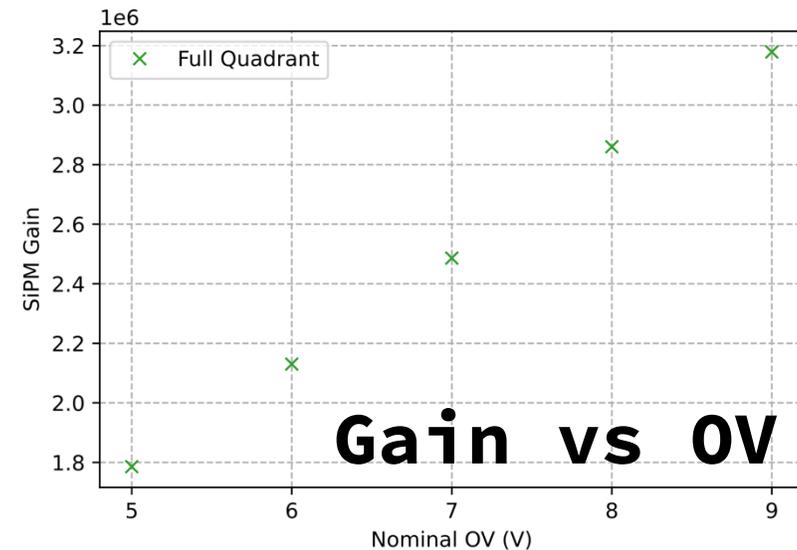

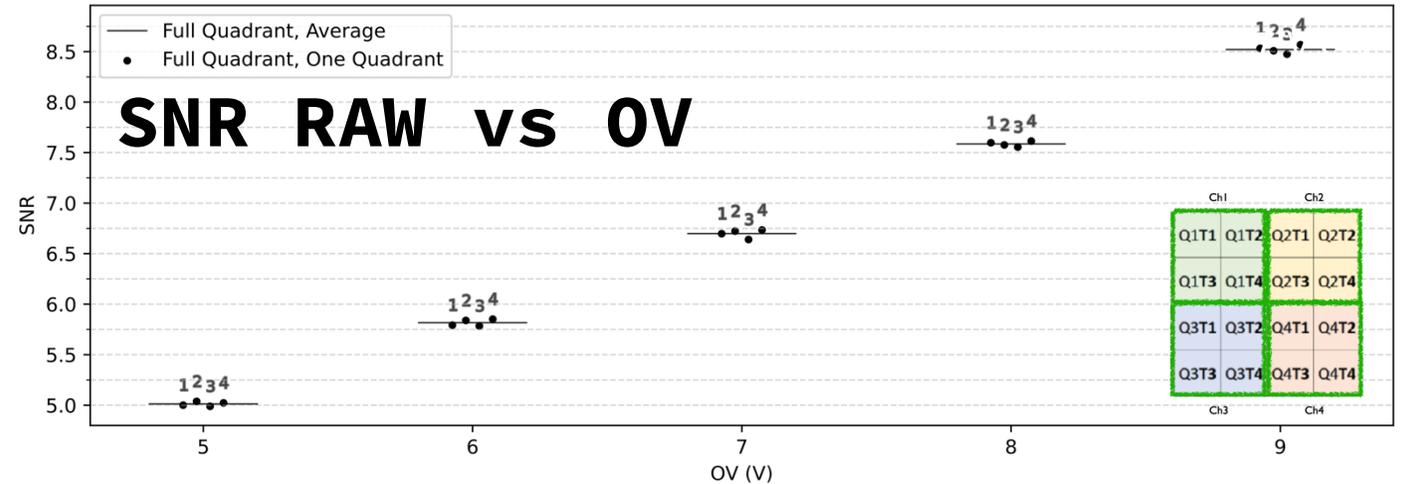

$SNR = 1 \text{ PE Ampl.} / \text{Noise}$

$\text{Resolution} = 1 \text{ PE Sigma} / 1 \text{ PE Charge}$

$\text{GAIN} = 1 \text{ PE Charge} / e$

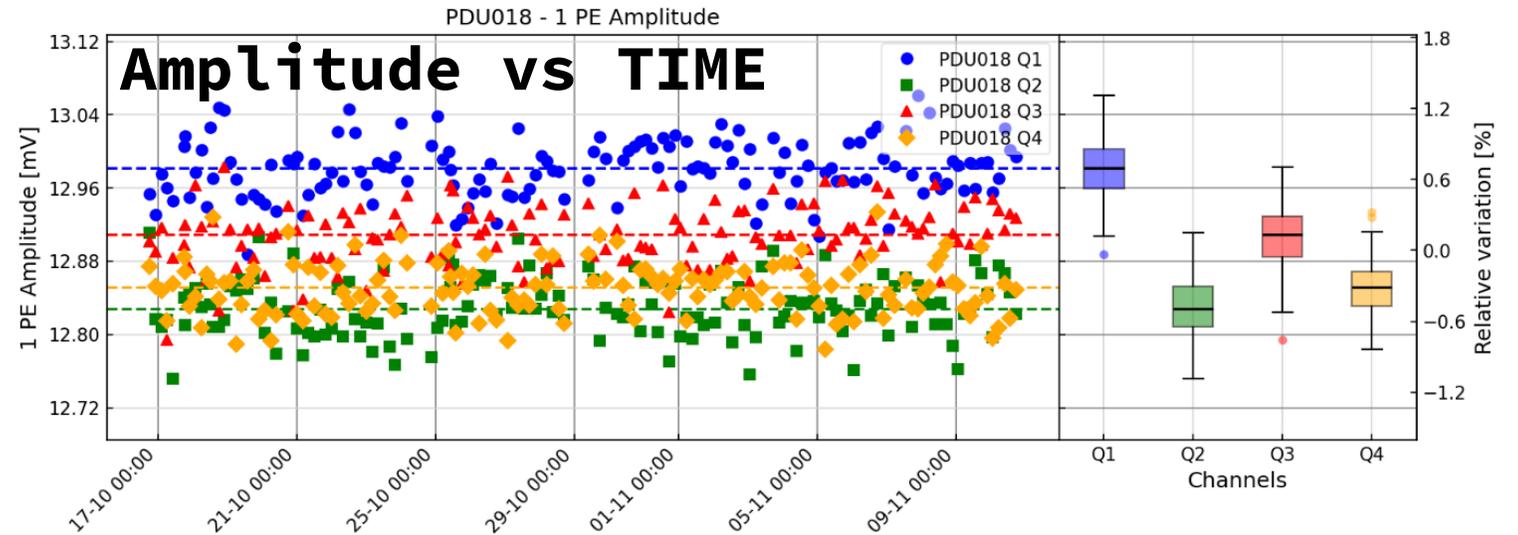

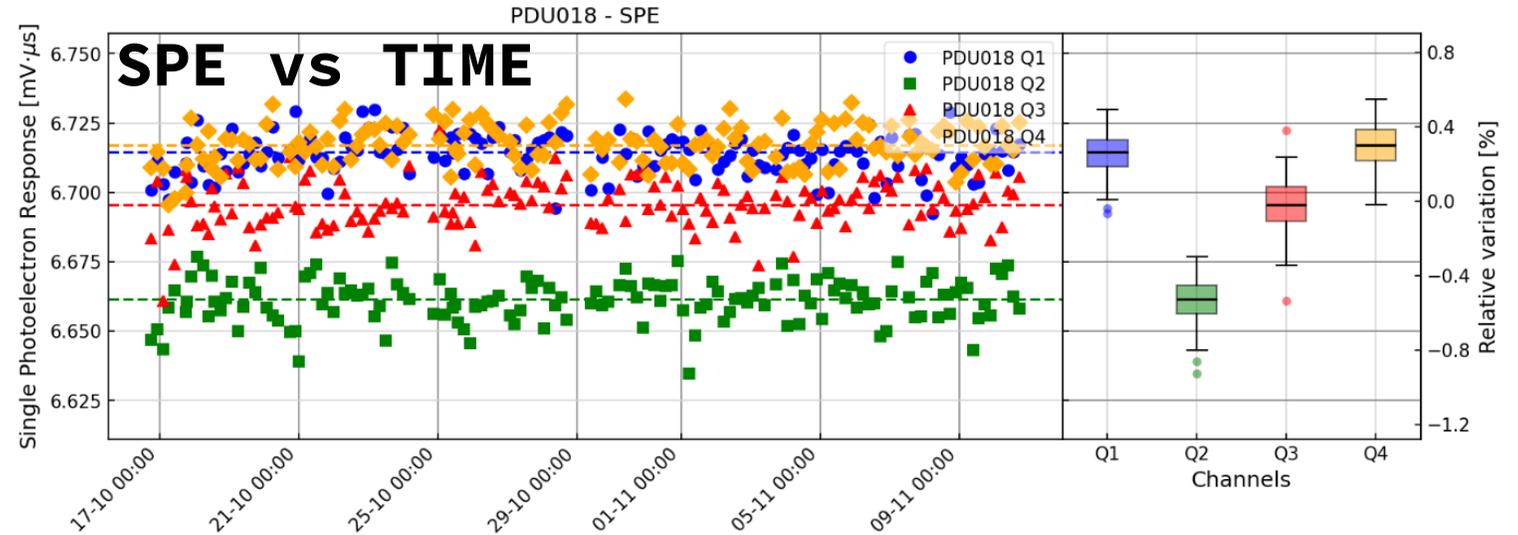

RES (RAW) = 13%
SNR (RAW) = 7
SNR (Matched Filter) = 14
Gain = 2.5e6

@ 7 V o.v. and 77 K

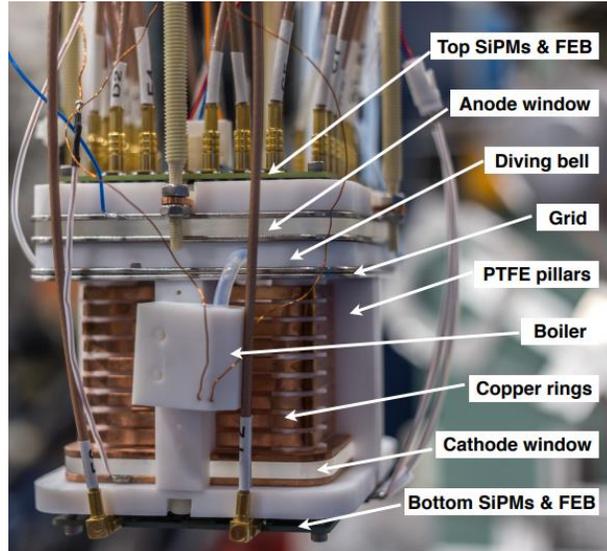

PDU: Stability

- All parameters stable on the order of months (0(1%))
- First prototypes
- SPE Stability < 0.5%
- Amplitude stability ~0.5%

In Liquid Argon...

ReD - Recoil Directionality

Constraints on directional sensitivity for NR in LArTPCs

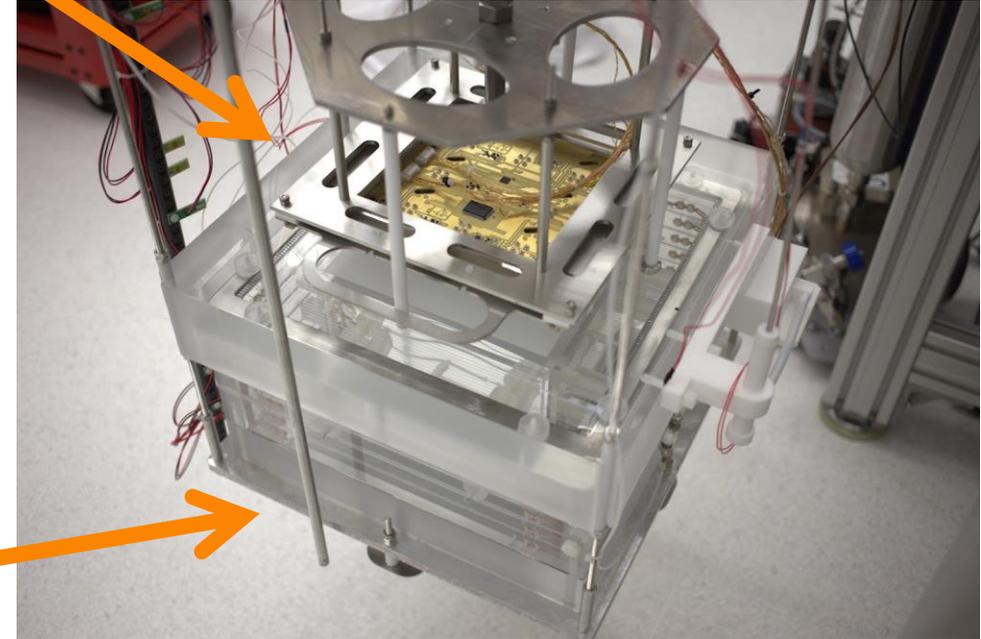

2 Phase LArTPC

~6 months LN calibration

> 1 y in cryogenic environment

DarkSide-20k Collaboration Eur. Phys. J. C 84, 24 (2024)

TOP PDU

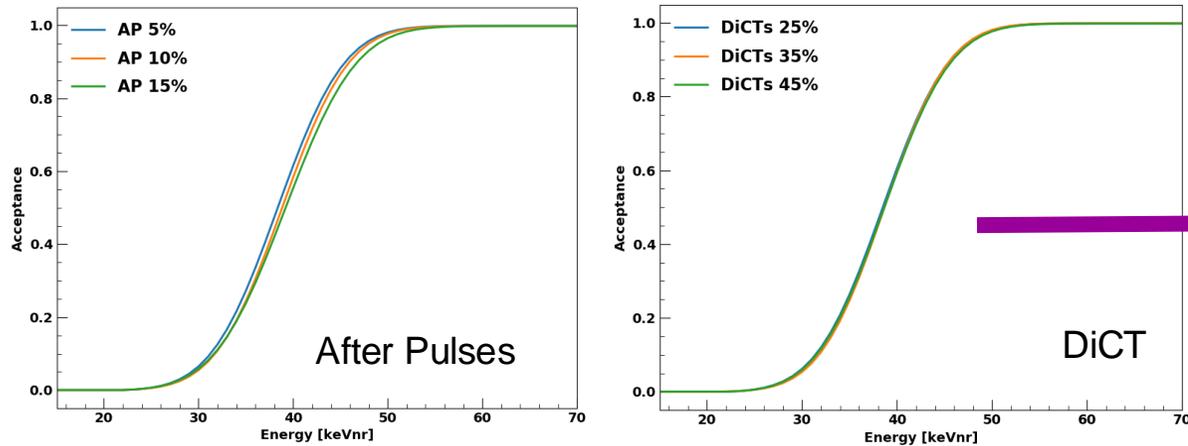

BOTTOM PDU

DarkSide Proto-0 - DS-20k Prototype with PDUs

PDU: impact on sensitivity

- Impact of PDU performance on PSD → effect on sensitivity
- DiCT influence on sensitivity can be reduced with a **hit-based reconstruction** for S1 (instead of charge integration)

Parameter	Value	Sensitivity at 100 GeV/c ² [cm ²]
PDE	40% at 6 VoV ($C_e=0.200$)	2.06e-48
PDE	42% at 7 VoV ($C_e=0.210$)	2.00e-48
PDE	45% at 9 VoV ($C_e=0.225$)	1.94e-48
DCR	$2 \times 10^{-5} \text{ ns}^{-1}$ at 6 VoV	2.00e-48
DCR	$4 \times 10^{-5} \text{ ns}^{-1}$	2.01e-48
DCR	$6 \times 10^{-5} \text{ ns}^{-1}$	2.01e-48
DiCT	25% at 6 VoV	2.00e-48
DiCT	35% at 8 VoV	2.02e-48
DiCT	45% NA	2.01e-48
AP	5% at 6 VoV	2.00e-48
AP	10% at 9 VoV	2.02e-48
AP	15% NA	2.05e-48

- Non-negligeable impact on sensitivity:
 - **PDE, After Pulsing**
- Negligible impact:
 - Dark Count Rate (DCR), Direct Cross Talk (DiCT)

Hit based S1 Reconstruction

The Analysis ROI for WIMPs has S1 ~ 500 PE

This result in occupancy for a single channel $\ll 1$ PE in 1 us time - we do not lose information.

Conclusions

- DarkSide-20k for WIMP direct search:
 - two-phase argon TPC with 20 t fiducial volume
 - Underground-extracted radiopure argon
- Photo-Electronics of DS-20k:
 - Development with an Assembly of Cryogenic SiPMs
 - PDU: Photon Detection Unit (20x20cm², 384 SiPMs + FEB → 4 Channels)
 - 2112 read-out channels in the TPC
 - Excellent SNR (7 raw, 14 with matched filter)
 - 12.5 mV amplitude and 13% (raw) resolution for single photon
 - DCR, AP and CT within specification for DS-20k physics goal

Acknowledgments: Dr. Yury Suvorov, Dr. Dmitrii Rudik (INFN Napoli) for picture and plots in slides 10, 13, 19, 20

Thank you!

(part of) The DarkSide-20k Collaboration at LNGS

backup

A different method (less model dependant) to study additional correlated pulses

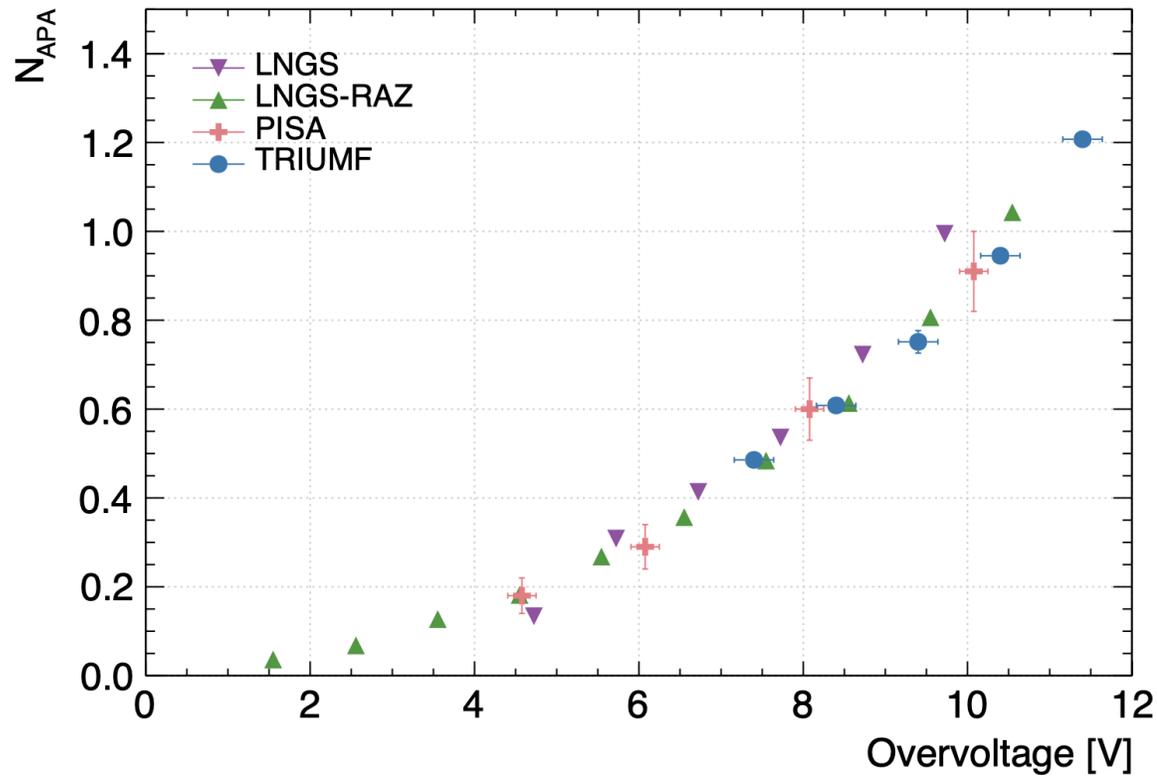

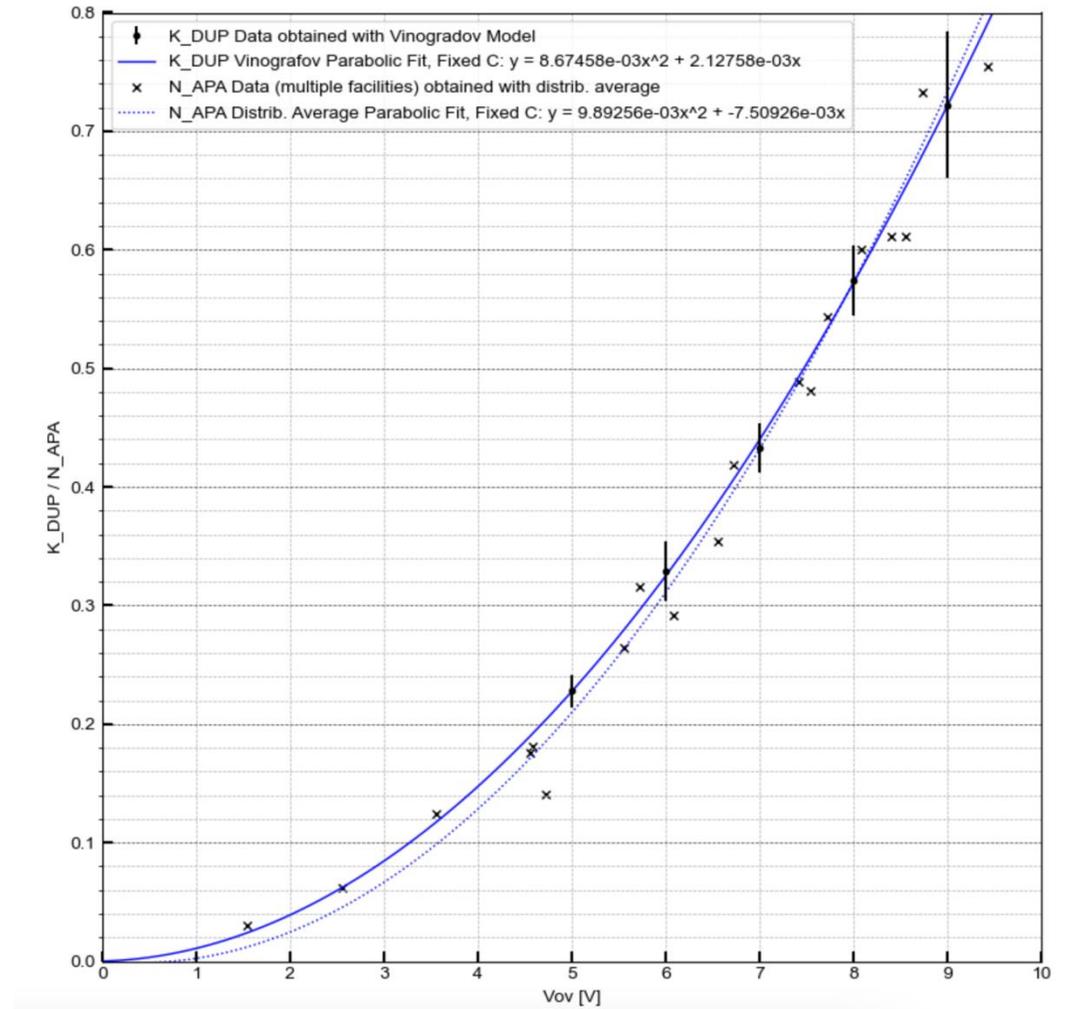

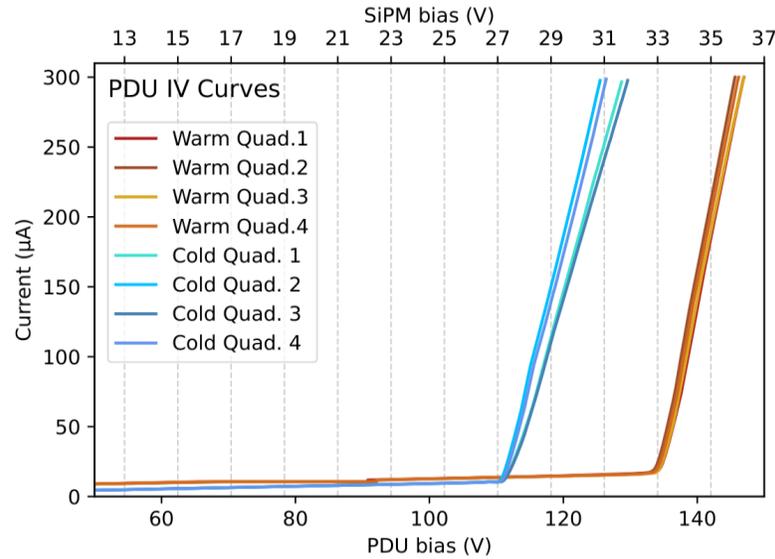

Fig. 17 Number of Additional Prompt Avalanches (APAs) measured at 77 K as a function of the over voltage.

$$N_{APA} = \frac{\langle Q_h \rangle}{\mu_P} - 1$$

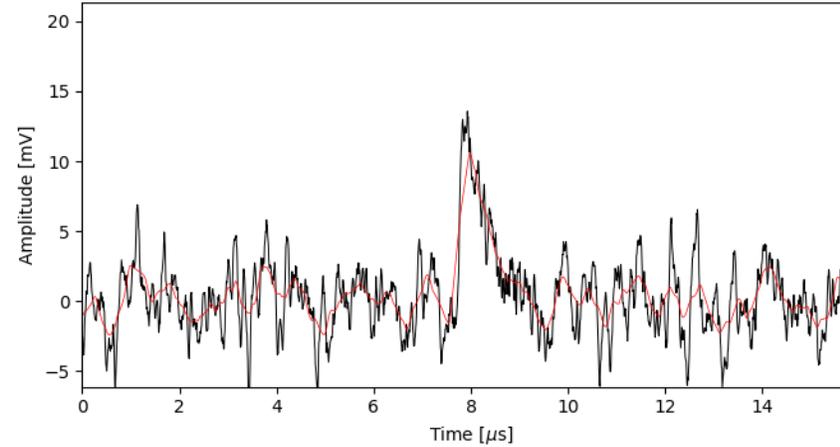

PDU: Breakdown voltage and signal shape

IV Curves

SiPM bias is different than PDU bias as the voltage is partitioned on four SiPMs

$$V_{BD} (77 \text{ K}) = 27 \text{ V}$$

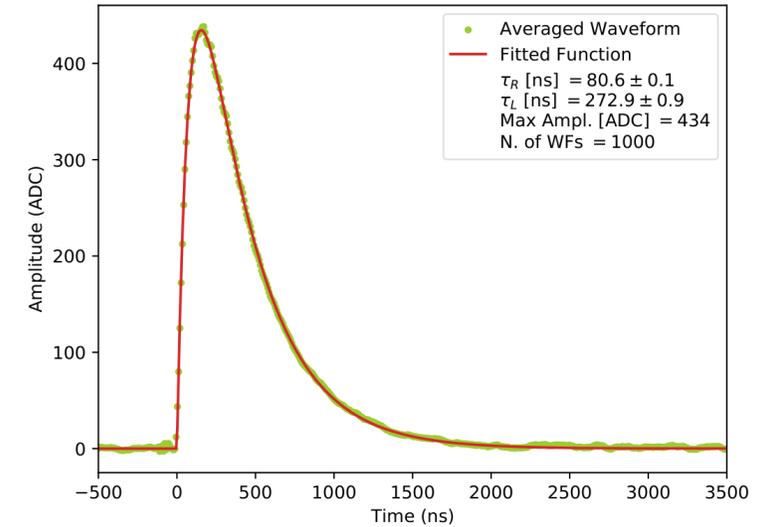

Typical waveform

Acquired with CAEN VX2740

Black: Unfiltered single PE waveform

Red: 50 Sample MA Filter
Obtained with external triggering in correspondance with fast pulsed laser

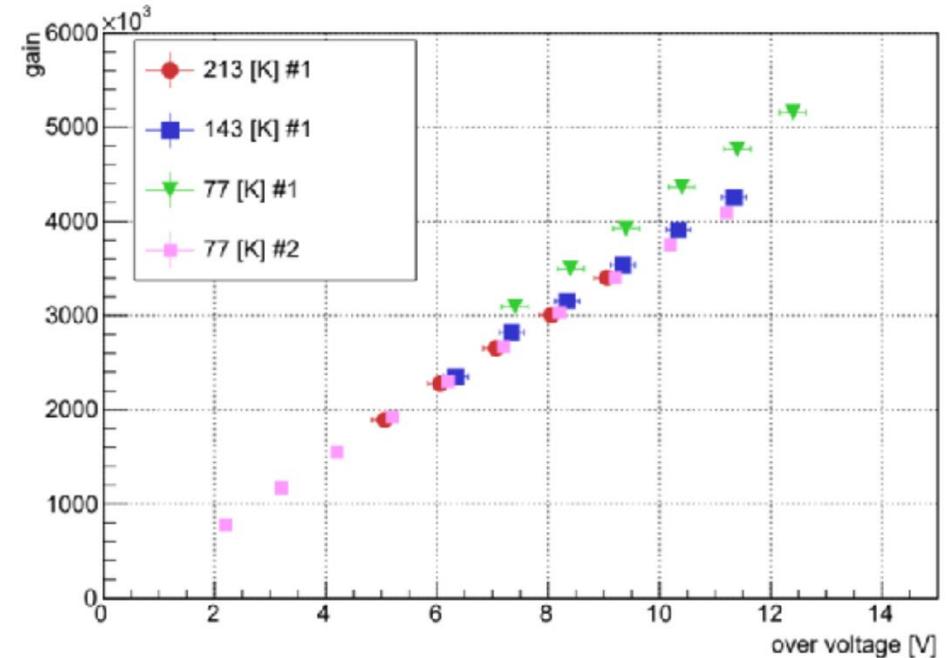

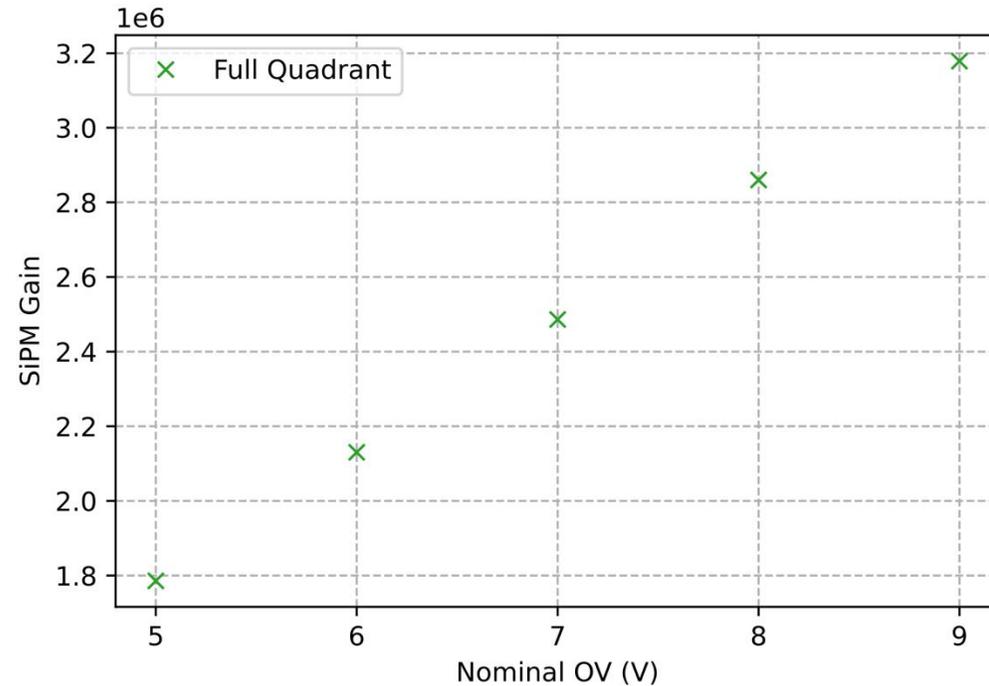

Waveform Template

To be used in matched filter

$$V(t) = A \left(e^{-\frac{t-t_0}{\tau_L + \tau_R}} - e^{-\frac{t-t_0}{\tau_R}} \right) \Theta(t - t_0)$$

1 PE Ampl. = 13 mV
Descent time = 350 ns

PDU: Gain

Gain

Charge of a single hit in units of elementary charge

Left: Measurement from PDU

Right: Measurement from Single SiPM

$$G = 2.5e6 \text{ @ } 7 \text{ V O.V.}$$

Correlated Avalanches in SiPMs

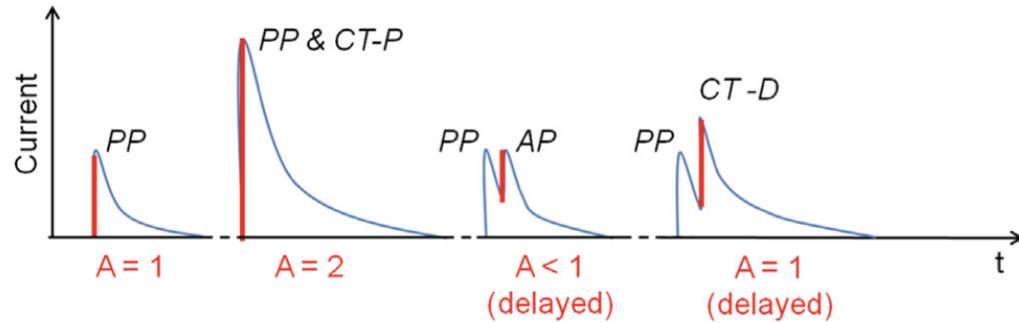

Fig. 7. Primary pulses (PP) with different types of correlated pulses such as prompt CT (CT-P), afterpulse (AP) and delayed CT (CT-D).

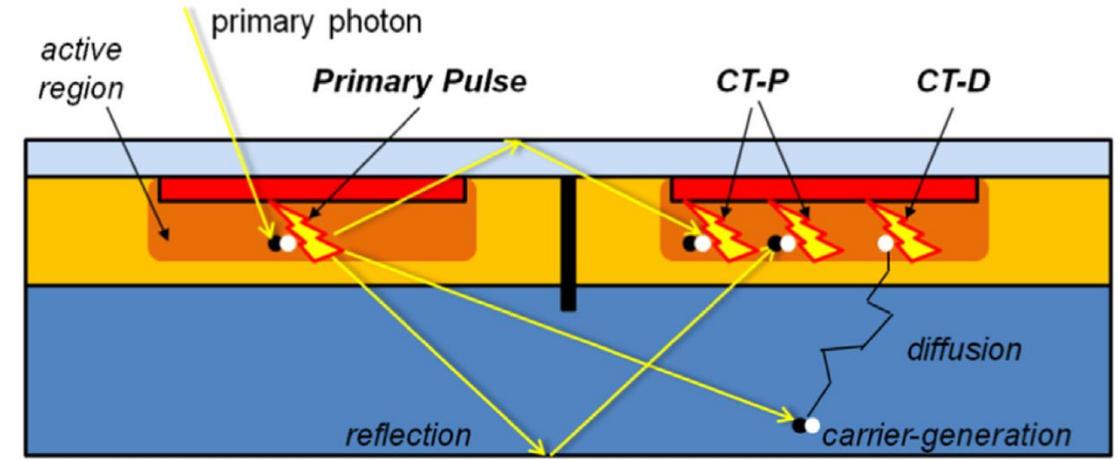

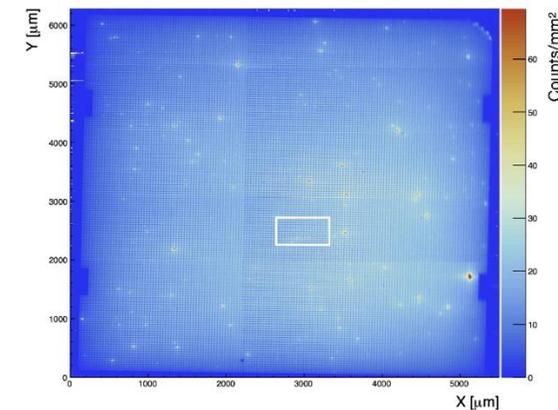

Fig. 2. Two different types of crosstalk: prompt (CT-P) and delayed (CT-D).

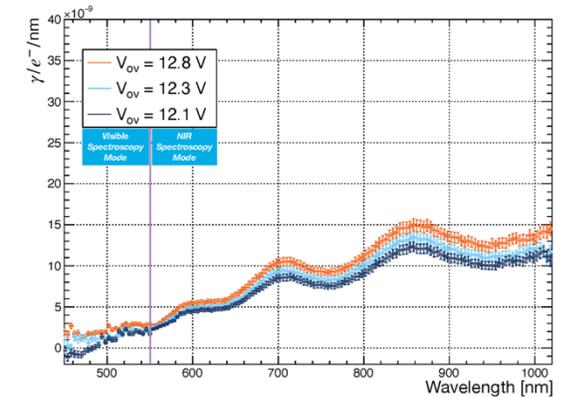

Correlated avalanches:

- After Pulsing (AP)
- Direct Cross Talk (DiCT)
- Delayed Cross Talk (DeCT)
- External Cross Talk (exCT)

Origin of external Cross-Talk
