

Acts Traccc Plugin

Frederik Verdoner Barba

Traccc

- Track reconstruction on CPU and GPU
- Detray: tacking geometry description
- Covfie: vector fields

Traccc to Acts EDM

- Cells
- Measurements
- Spacepoints
- Seeds
- Tracks

Core edm conversion functionality can be found in **Plugins/Traccc/**

Traccc Chain Example

ActsExamples/Traccc

- CPU Chain example
- CUDA Chain example

```
chainConfig = acts.examples.TracccChainConfig()

addTracccChain(
    s,
    recoGeometry,
    field,
    digiConfigFile=oddDigiConfig,
    inputCells="cells",
    outputDirRoot=outputDir,
    chainConfig=chainConfig,
    logLevel=acts.logging.INFO,
    platform=args.platform,
    enableAmbiguityResolution=args.ar,
)
```

Results (full chain)

ODD, geometric config, 500 events, precision=float

Acts Covfie Plugin

Covfie Plugin

- Functions for converting ACTS magnetic fields to covfie fields:

ConstantMagneticField

InterpolatedMagneticField

MagneticFieldProvider

```
def test_constant_field_conversion():
    from acts import covfie

    v = acts.Vector3(1, 2, 3)
    af = acts.ConstantBField(v)
    cf = covfie.covfieField(af)
    view = covfie.newView(cf)
    points = [(0, 0, 1), (1, 1, 1), (1, 0, 2)]
    for x, y, z in points:
        assert view.at(x, y, z) == [1, 2, 3]
```

```
/// @brief Creates a covfie field from an interpolated magnetic field.
/// @param magneticField The acts interpolated magnetic field.
/// @return An affine linear strided covfie field.
InterpolatedField covfieField(
    const Acts::InterpolatedMagneticField& magneticField);

/// @brief Creates a covfie field from a constant B field.
/// @param magneticField The acts constant magnetic field.
/// @return A constant covfie field.
ConstantField covfieField(const Acts::ConstantBField& magneticField);

/// @brief Creates a covfie field from a magnetic field provider by sampling it.
/// The field must be defined within min (inclusive) and max (inclusive).
/// @param magneticField The acts magnetic field provider.
/// @param cache The acts cache.
/// @param nBins 3D array of containing the number of bins for each axis.
/// @param min (min_x, min_y, min_z)
/// @param max (max_x, max_y, max_z)
/// @return An affine linear strided covfie field.
InterpolatedField covfieField(const Acts::MagneticFieldProvider& magneticField,
    Acts::MagneticFieldProvider::Cache& cache,
    const std::vector<std::size_t>& nBins,
    const std::vector<double>& min,
    const std::vector<double>& max);
```

Plugins/Covfie/FieldConversion.hpp

Future work

- Test CUDA Chain example
- Obtain detrayer detector using detrayer plugin (currently it reads from a file)
