

# GBT-FPGA Interface

Carson Teale

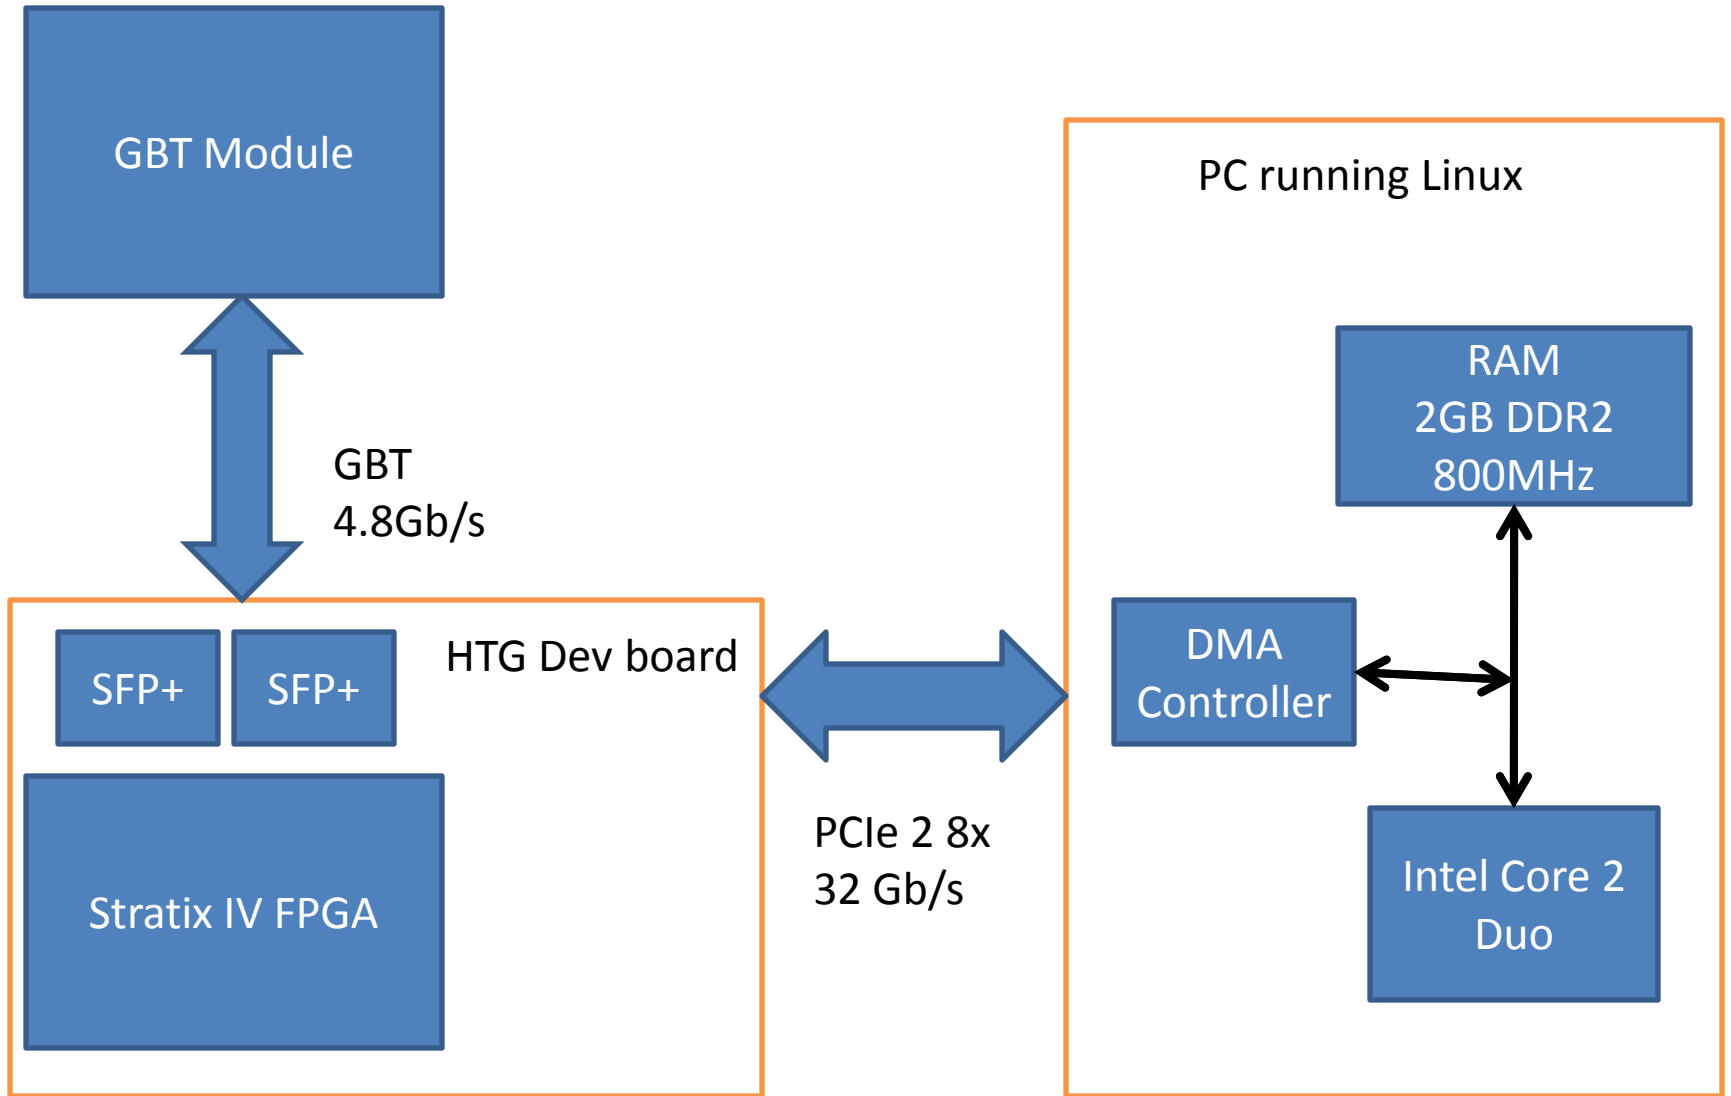

# GBT

- New radiation tolerant ASIC for bidirectional 4.8 Gb/s optical links to replace current timing, trigger, and control system of LHC experiments
- Will be proposed for combined transmission of physics data, trigger, timing, fast and slow control and monitoring
- GBT modules located at detectors

# FPGA

- Counting room electronics don't need to be radiation hard
- Implement transceiver using commercial FPGA
- High Tech Global board with Altera Stratix IV FPGA and two SFP+ transceivers.

# What I've done so far

- Learned some VHDL
- Simple test VHDL programs to blink LED's with push buttons on board
- Configured PCI hard IP core
- Learning about Linux drivers

# What I need to do

- Modify/write linux DMA driver to allow board to read/write to memory through PCIe bus
- Interface with GBT module using SFP+ transceiver
  - Most FPGA code for this is available through the PH-ESE department
- Run tests to verify speed and accuracy of GBT module
