

Study of Single and Diboson Z Production at the LHC

David Sweigart
Massimiliano Bellomo, Supervisor

European Organization for Nuclear Research
07 July 2011

A Toroidal LHC ApparauS

- General purpose detector
- Designed to identify particles and measure their properties
- Explores the high energy frontier for new physics

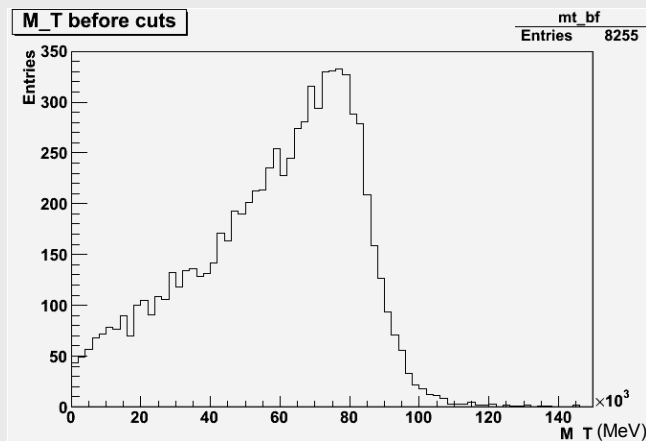

Diboson Z Production

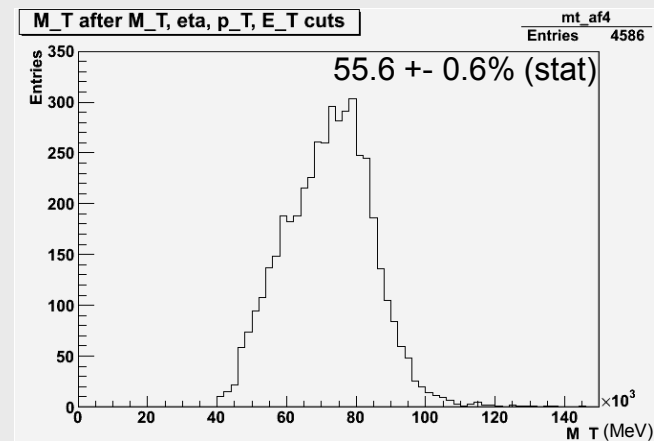

- Important test on the high energy behavior of electroweak interactions
- $ZZ \rightarrow \ell\ell\nu\nu$ decay channel has a large sample size needed for analysis
- Precise cross-section measurements will enhance sensitivity to gauge coupling
- Deviations from SM indicate new physics
- If none, we set stringent new limits on models beyond SM

My Project

- Learned the basics of ROOT
- Coded data analysis program to run on Monte Carlo and 2010 data
 - Learned how to make cuts to reduce background

Transverse Mass of muons
before cuts

Transverse Mass of muons
after cuts on M_T , η , p_T , E_T^{MISS}

My Project

- Switched over to W/Z CERN group data analysis code
- Learning how the program works
- Future work:
 - Implement $ZZ \rightarrow \ell\ell\nu\nu$ module for 2011 data analysis
 - Run it on 2011 data and MC simulations
 - “Rediscovery” of Z-boson production in muon decay channel
 - Studies of ZZ production in $\ell\ell\nu\nu$ decay channel
- Future Goals: Become more experienced in ROOT and learn more about particle physics

Adventures

La Sagrada Família
Barcelona, Spain

Lyon, France

Hiking Mont Salève

Backup Slides

ROOT

List of data files

Read Event

Good Runs List
Require event to be in the GRL

Read Muon

Cuts
Require muons to satisfy specific conditions

Fill Histograms

Loop through Muons

Calculate Acceptances

Loop through Events

Submit to Cluster
