

Gas Management of EE Chambers

By: Eric Seabron

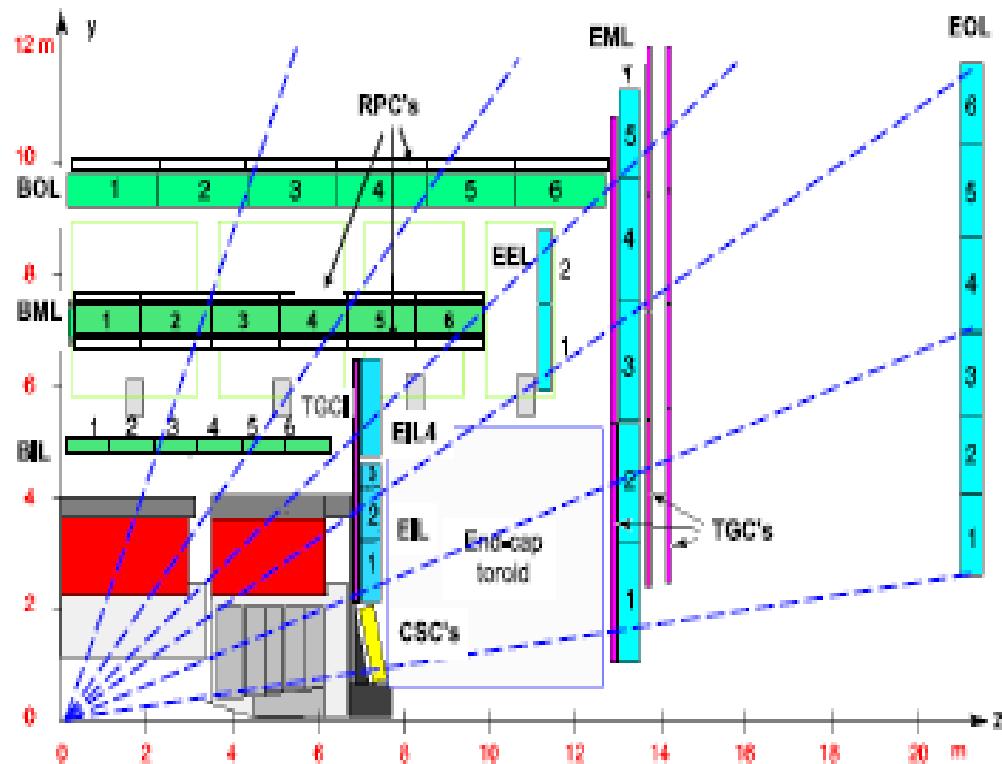

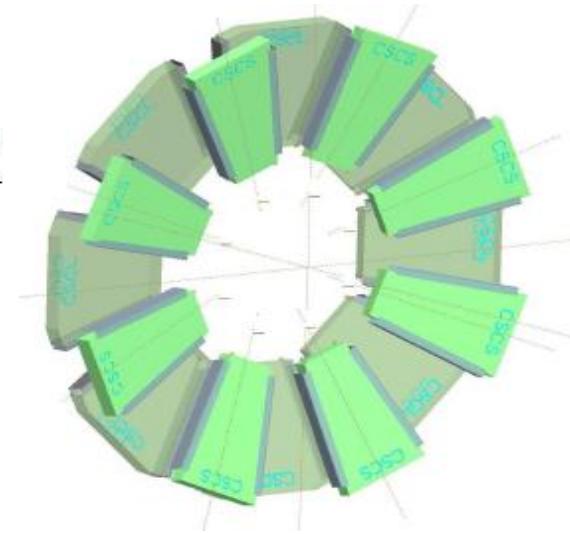

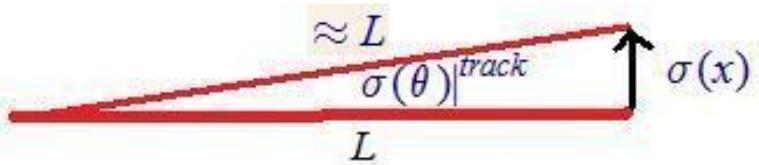

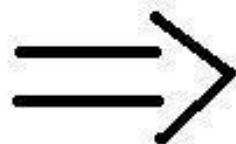

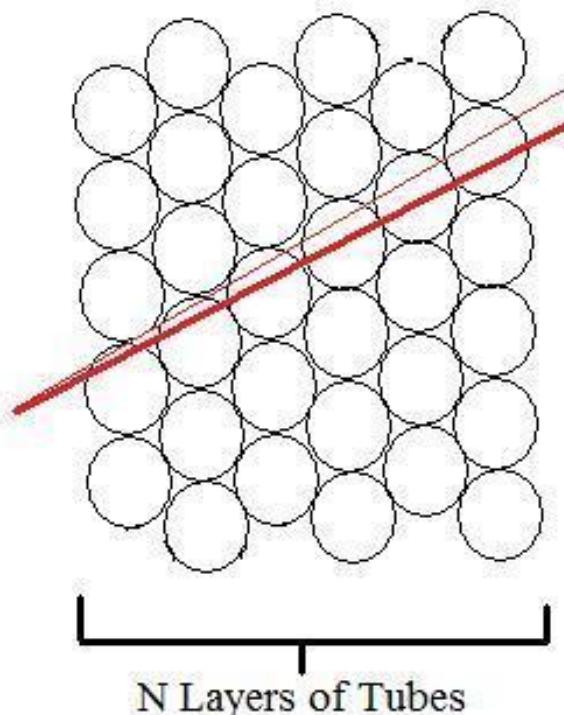

$$\text{momentum, } p = \frac{eB(N \cdot k)^2}{8S}$$

$$\eta = -\ln\left(\tan\frac{\theta}{2}\right)$$

$$1.1 < \eta < 1.4$$

Notice that $\theta < \pi < 1 \Rightarrow \sigma(\theta) = \frac{\sigma(x)}{L}$

$$\sigma(\theta) = \frac{\sigma(z)}{L} \sqrt{\frac{(N-1)}{N(N+1)}}$$

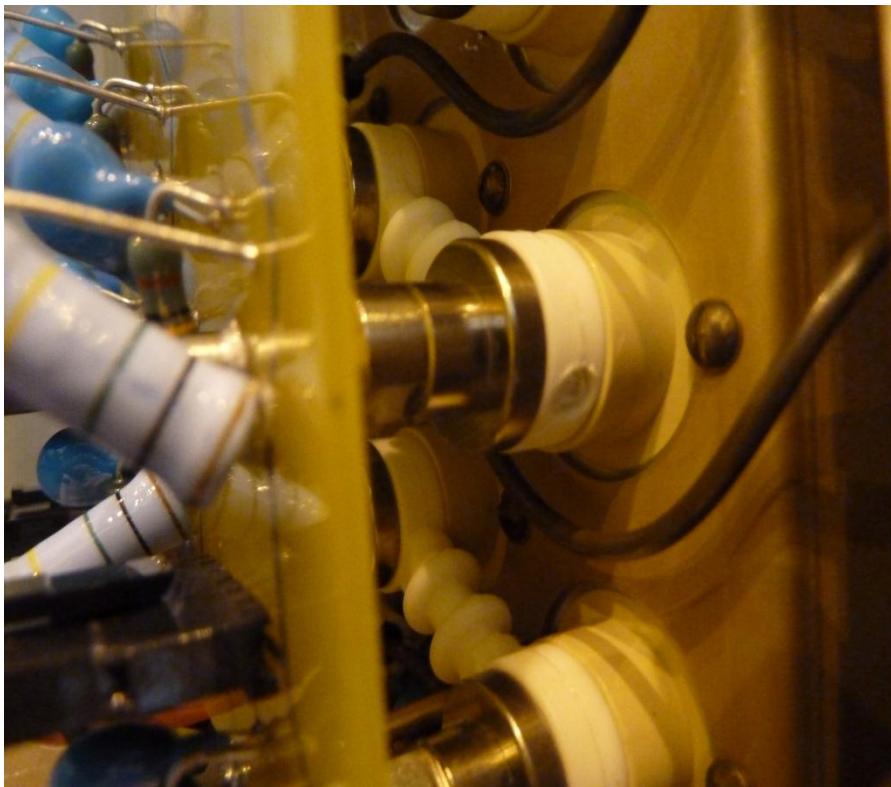

Thus $\sigma(x) = \sigma(z) \sqrt{\frac{(N-1)}{N(N+1)}}$, notice $\sigma(z) = (\text{resolution}) \times z$

The error in the Segitta, $\sigma(s) = \sigma(x) \sqrt{\frac{3}{2}}$

LEAKS = \$ & Efficiency

~~LEAKS~~ $\equiv < 2 \text{ mbar/day}$

For $N = 6$ and $\sigma(z) = 80\mu\text{m}$ we obtain:

$$\sigma(x) = (80\mu\text{m})\sqrt{\frac{5}{42}} \approx 27.603\mu\text{m}$$

$$\sigma(s) \approx 33.807\mu\text{m}.$$

For $N = 8$ and $\sigma(z) = 80\mu\text{m}$ we obtain:

$$\sigma(x) \approx 24.944\mu\text{m}$$

$$\sigma(s) \approx 30.432\mu\text{m}.$$

For $N = 5$

$$\sigma(x) \approx 29.212\mu\text{m}$$

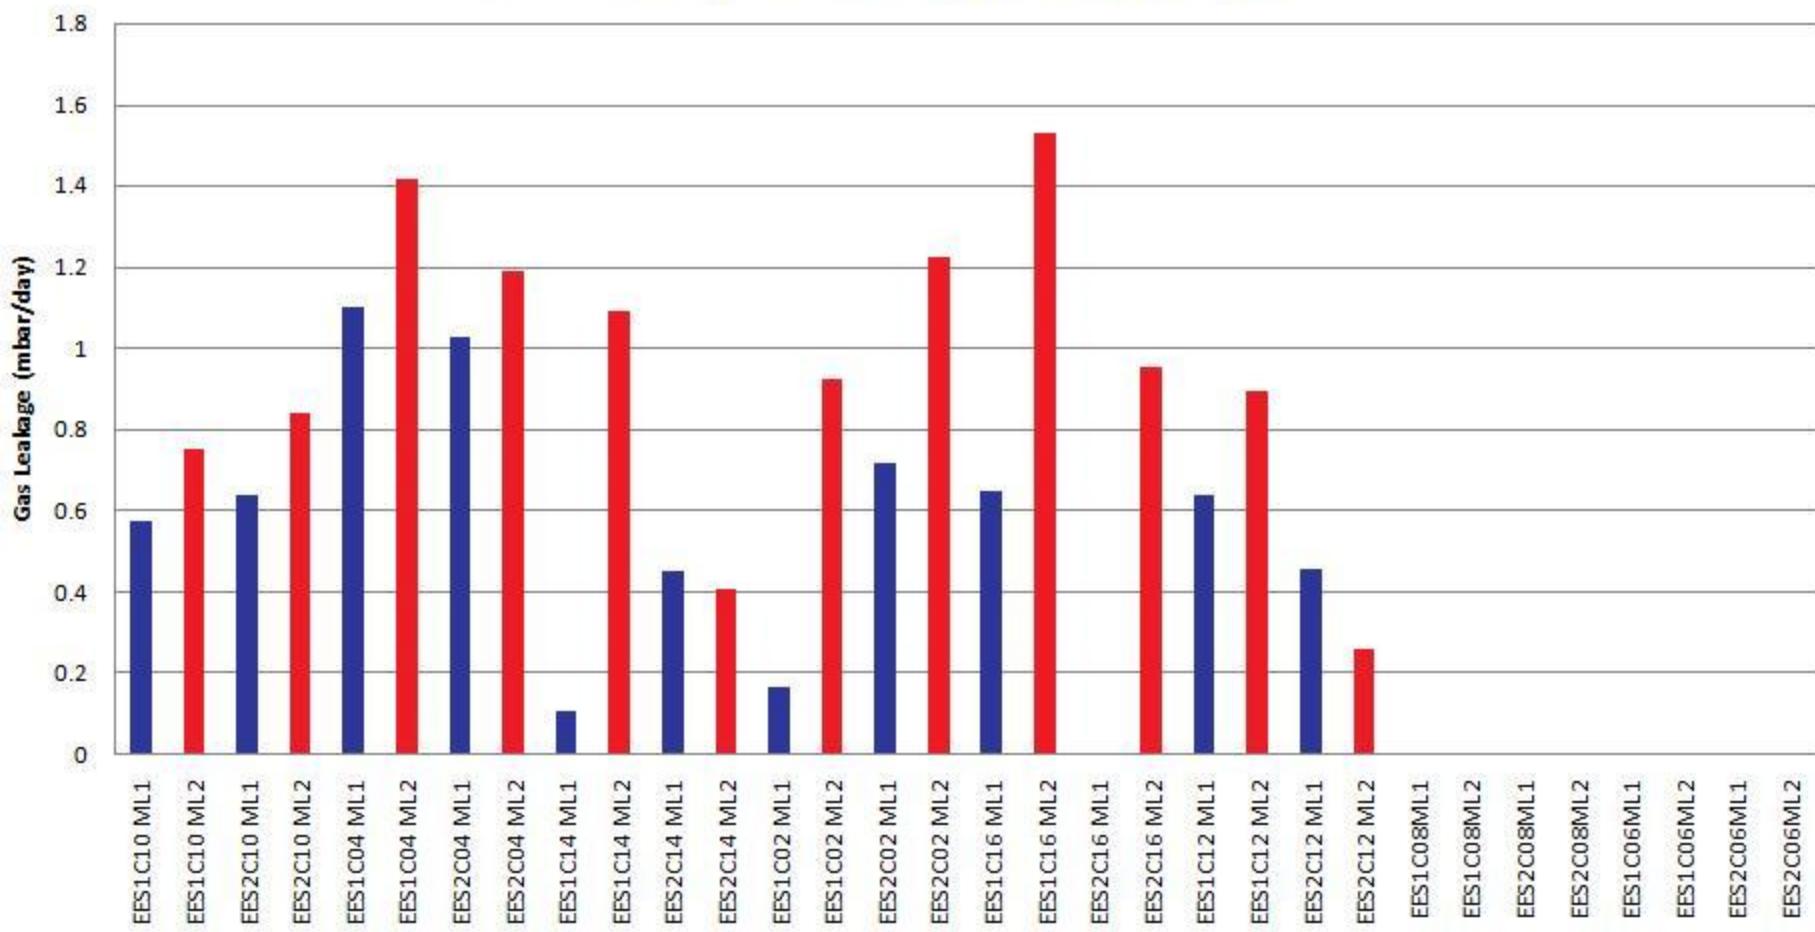

$$\sigma(s) \approx 35.785\mu\text{m}$$

For $N = 3$

$$\sigma(x) \approx 32.66\mu\text{m}$$

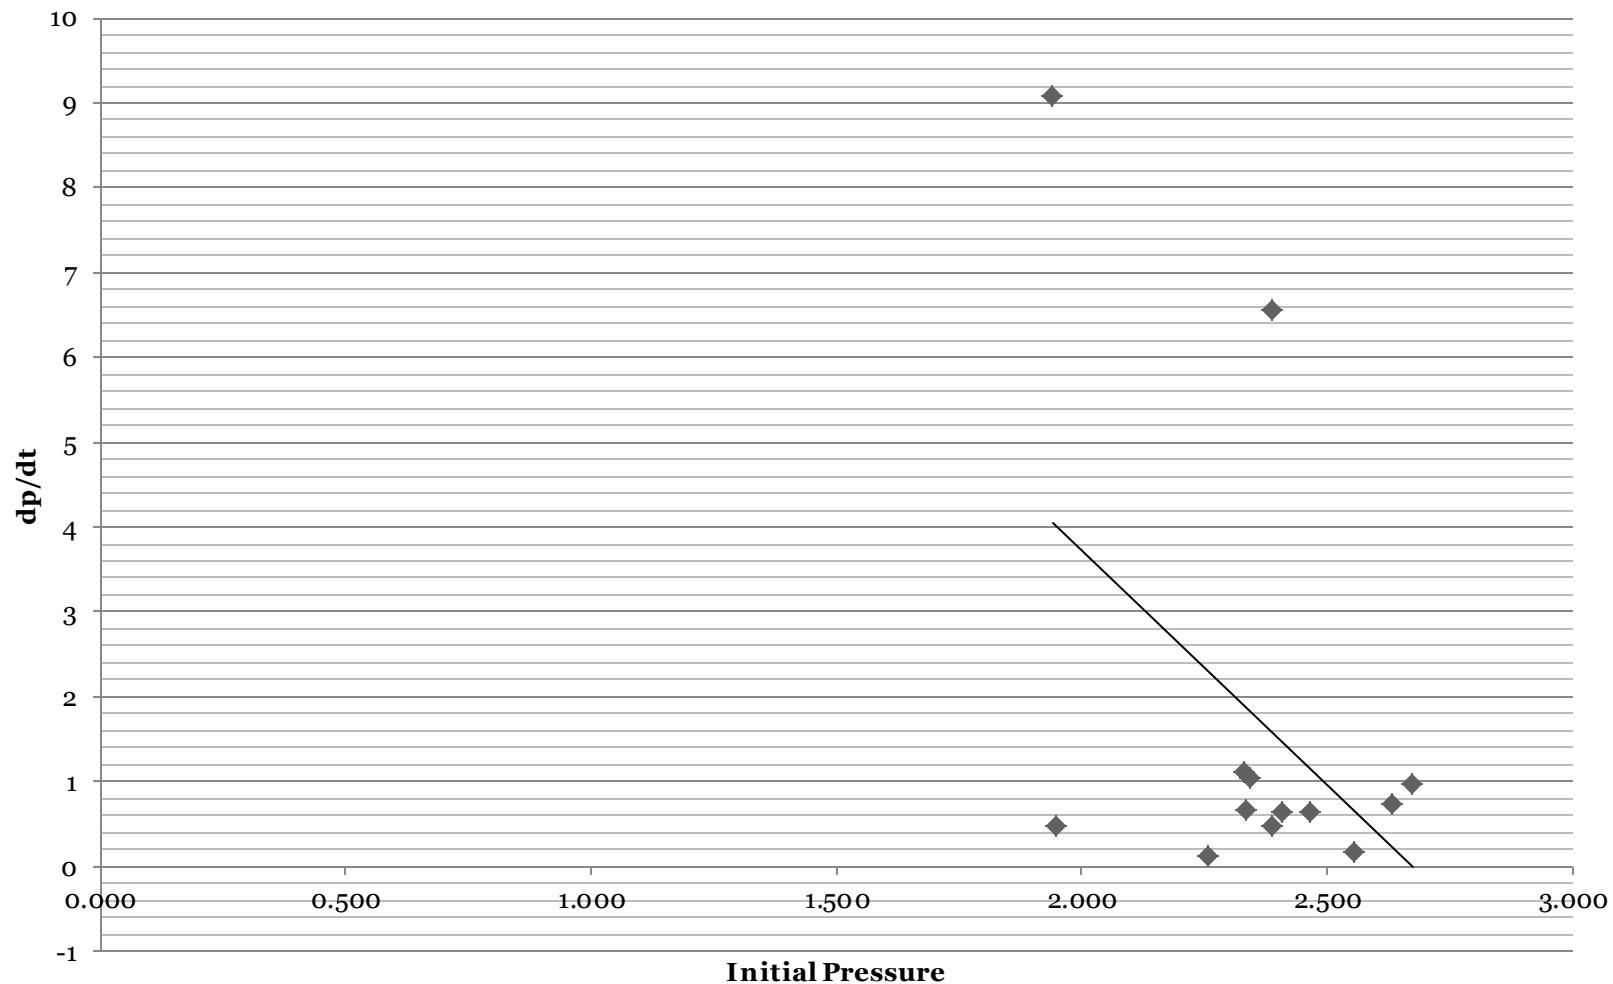

$$\sigma(s) \approx 40.01\mu\text{m}$$

Leak Tests [Sectors 04,06,08,10,12,14,16]

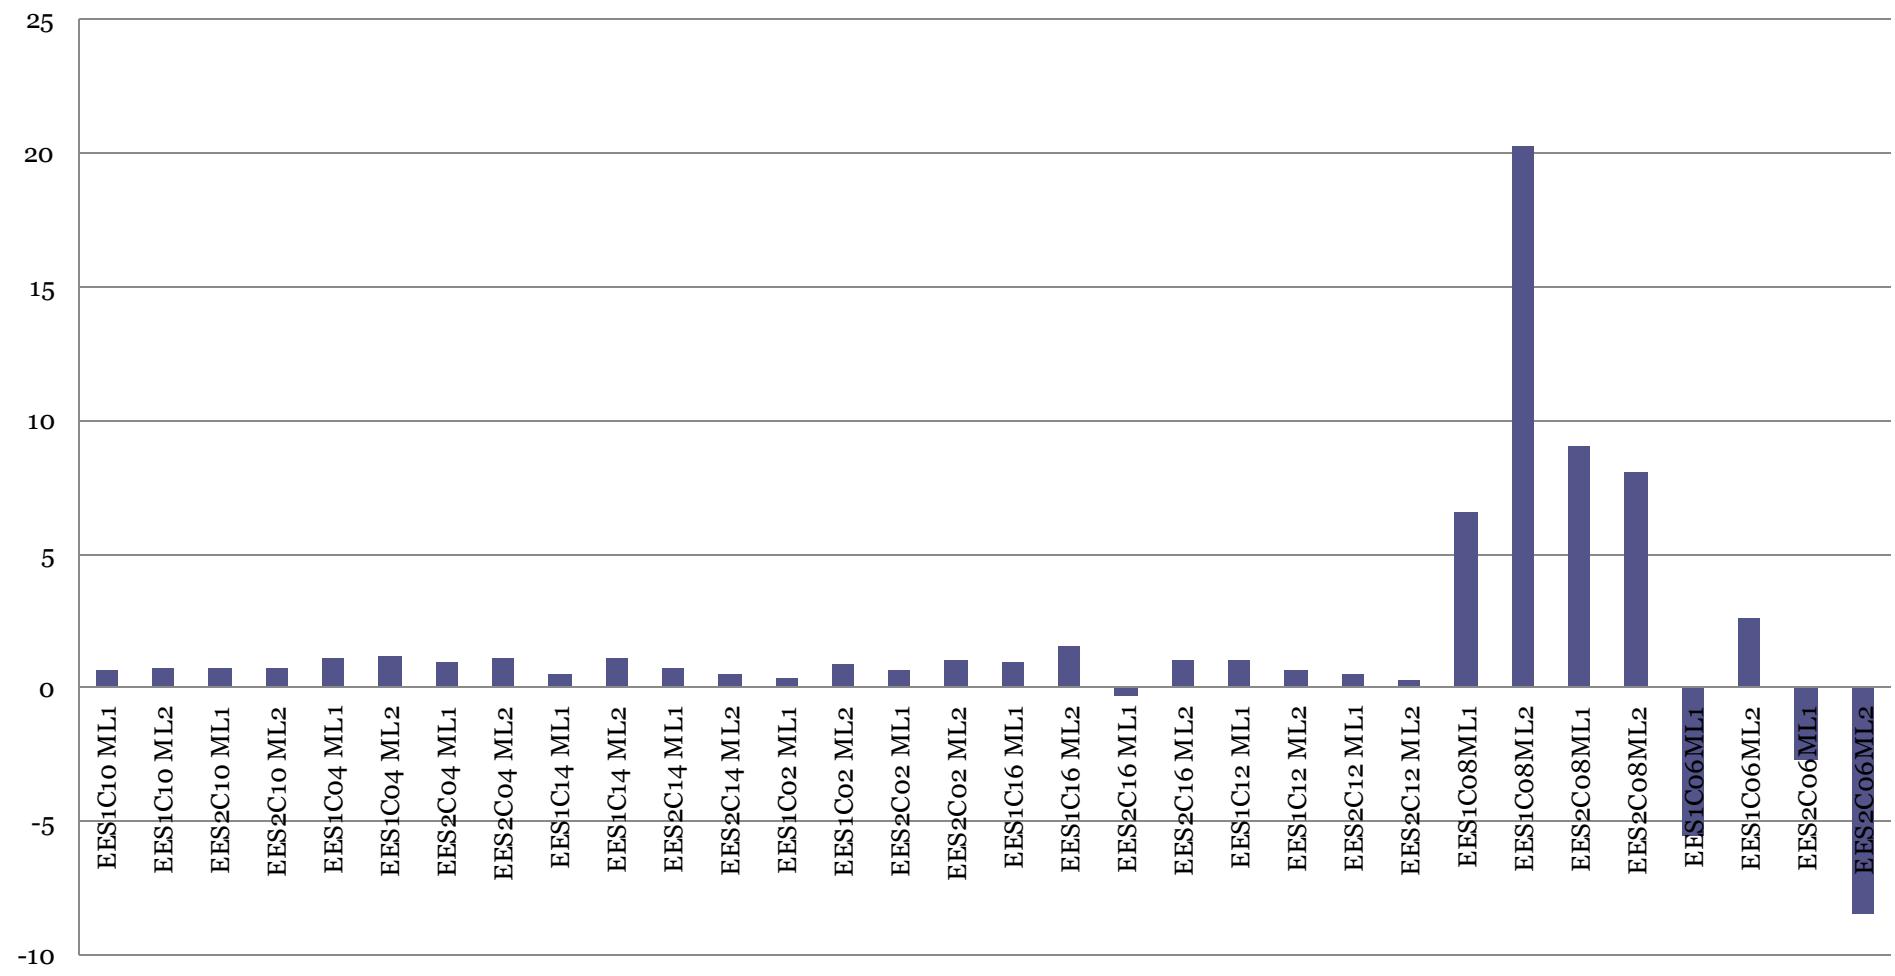

Correlation Plot

$$y = -5.522x + 14.76$$
$$R^2 = 0.695$$
